INDEX.

A

Abattoirs, Public, 27, 31, 71
Aberdeen Water Supply, 205, 230
Abertillery, Clinker Mexphalte Roads and Disposal of Refuse Destructor Clinker at, 524
Abingdon Extraordinary Traffic Case, 455, 503
Acquisition of Land Bill, 346
Action against an Irish County Surveyor, 104
Activated Sludge Process, 30, 33, 40, 83, 160, 247, 282, 373, 379, 453, 479, 504
Administration, Politics and, 203
Afforestation, 251
Alexandra Bridge, Pietermaritzburg, 35
Alien Contractors, 529
Alignment Diagram Applied to Water Mains, 1, 15
Animals Straying on the Highway, 94
An Improved Metropolis, 350

Annual Reports:—
Aberdeen, 205, 230
Bedfordshire, 110
Belper (Rural), 172
Berkshire, 221
Birmingham, 163, 172
Bristol, 177
Cape Town, 294
Cumberland, 408, 409
East Suffolk, 161, 167
Herefordshire, 39
Johannesburg, 216, 227, 270
Kent, 455
Leeds, 449
Middlesex, 34
Newcastle-on-Tyne, 79, 82, 90
Nottinghamshire, 404, 409
Oxfordshire, 194
Pembrokeshire, 82
Sheffield, 378, 385
Somerset, 123
Tiverton, 293
Warwickshire, 126
Wimbledon, 354
Worcestershire, 190
Appointments During War Time, 115
Arbitrator, The Engineer as, 539
Architects and Slum Areas, 425

Architectural Association:—
Active Service Committee, 447
Presidential Address, 452
Arterial Roads in Greater London, 49, 399, 410
Artesian Wells, Effect of Tidal Flow on, 343

Association of Managers of Sewage Disposal Works:—
Annual Meeting, 568, 578
Presidential Address, 29
Summer Conference at Sheffield, 28, 33, 40, 93
Sutton Meeting, 264

Association of Municipal Authorities of Ireland:—
Annual Congress, 298, 328
A Tactless Proceeding, 3, 14
Automatic Lighting in Birmingham, 163

B

Bath, Road Foundations in, 380
Baths, St Annes-on-the-Sea Open Air, 6
Baths, Selection of Sites for, 251
Bedfordshire, Road Maintenance in, 440
Belfast, Refuse Collection and Disposal in, 498
Berkshire Roads, 221
Bexhill's New Isolation Hospital, 46
Birmingham Housing Proposals, 202
Bognor and Motor 'Buses, 446
Bradford Cleansing and Destructors Department, 482
Branston Rural Surveyors under the Harrow, 95, 97
Bristol Baths, 261, 268
Bristol, Bituminous Roads in, 253
Bristol Electricity Profits, 231
Bristol Refuse Destructor, 228, 261
Bristol Tramways, 255
British and American Measures, 214
British De-Tinning Company's Scheme, 30, 127, 155, 164, 236, 266, 281, 306, 433, 495, 550, 572
British Weights and Measures, 490
Builders and Tendering, 571
Building By-laws, Munition Works and, 562
Building Construction, New System of, 220
Building Contracts and the War, 94
Building Line Difficulty, 373
Building Progress in Shanghai, 171
Building Restrictions, Public Health and, 591
Building Statistics, Charts for, 335
Buxton Incorporation, 20
By-law Administration, 515

C

Caerphilly's New Sewage Disposal Works, 124
Calcutta, Use and Waste of Water in, 493, 499
Camberwell, Street Watering at, 389
Camp Scavenging: Council or Military Control? 247
Canada, Outlook for British Engineers in, 159, 412
Canada, Sewage Disposal and Water Supply in, 215
Canals and Waterways, 30
Cape Town, Municipal Engineering Work at, 294
Cardiff's Development, 57
Cardiff, Use of Steam Tractors in Cleansing Work at, 65
Cardigan Rural Surveyor's Salary, 274
Charing Cross Bridge, Parliament and, 2
Charts for Building Statistics, 335
Chatham Municipal Coal Depot, 580
Chesterfield, Cleansing Work at, 501
Chimney as a Bedroom, 194
Chimney Shafts, Repairs to Brick, 195
Chiswick, Tar Surfacing in, 461, 483
Chlorination of Water, 252
Cistern and Sewer, 23
Civic Study in Civic Designs, 1, 5, 8
Civic Survey Exhibition, Manchester, 381
Civil Engineers and Parliamentary Representation, 457
Cleansing Costs, Bradford, 482
Cleansing Work at Chesterfield, 501
Cleansing Work, Organisation in, 87
Clifton Suspension Bridge, 255, 260
Clinker-Mexphalte Roads, 329, 515, 524
Coal Depot, Chatham Municipal, 580
Coal, Economy in the Use of, 351
Combined Railway and Road Bridge, 475
Concrete Drinking Troughs, 104

Concrete Institute:—
Meeting, 592
Presidential Address, 484
Concrete Roads, Future of Granite Macadam and, 448, 482, 502, 525, 548, 580
Concrete, Setting of, 173
Concrete, Tests of, 484
Conscientious Objectors, Employment of, 389, 407, 532, 570
Continuous Beams, Design of, 302
Contractor's Claim for £97,000, 30
Contracts, War and, 412, 438, 594
Contract Work and Day Work, 422, 424
Conway, Mussel Purification Tanks at, 237
Copper Sulphate Treatment of Water, 270

Correspondence:—
Abattoirs, Public, 71
Air Raids and Wood Paving, 360
Bitumen? What is, 7
British and American Measures, 214
British Decimal System, The, 287
Concrete Roads, 502, 525, 548, 580
Concrete, The Setting of, 173
Cottages, Mud as a Building Material for, 72
Cremations, Germans and, 214
Decimal System, The British, 235
Electric *v.* Cable Tramways, 503
Extraordinary Traffic Again, 503
Granite, Macadam, and Concrete Roads, The Future of, 482
Housing, Public Utility Societies and, 432
Institution Meeting at Blackpool, The, 72, 92
Institution of Municipal and County Engineers: Nomination for Council, 1917-18, 549
Measures, British and American, 214
Mechanical Stone Breaking, 389
Metric System, The, 320
Military Service, Surveyors and, 549, 580, 600
Motor 'Buses and the Roads, 173
Mud as a Building Material for Cottages, 36, 235
Pedestrian Traffic, Regulation of, 525
Petrol Allowances, Surveyors', 122, 148
Premature Burial, 173
Pressure Filters, 287
Reinforced Concrete and Ferro-Concrete, 37
Reservoirs, The Design and Cost of, 599
"Scavenger," The Origin of, 482
Steam Tractors *v.* Horse Haulage, 148
Street Lamps, The Masking of, 214
Surveyors and Military Service, 549, 580, 600
Tar-Surfacing at Chiswick, 483
Transport Reform, 7, 36
Vacant Land in Towns, Utilisation of, 483
Waste Pipe, When is a Waste Pipe not a? 483
Corrosion Research, 183
Corrugation, Causes of Tramway Rail, 214
Cost of Road Upkeep, 159
County Councils and Housing Loans, 429
Cremation, Germans and, 214
Cross Hill, Birkenhead, Covered Service Reservoir, 540, 546
Crystal Palace School of Practical Engineering, 131
Cultivation of Commons, 557
Cumberland, Road Maintenance in, 408
Cumberland, Steam Motor Haulage in, 409

D

Dams, Instability of, 445
Decimal Coinage and Metric System, 122, 287, 300, 329, 330, 394, 490, 597
Defence Regulations, Local Authorities and, 580
Design of Continuous Beams, 302
Development of Hilly Sites, 451
Diagrammatic Statistics for Municipal Engineers, 135, 138
Diesel Oil Engines, 113, 116
Direction Signs, 158, 170

Disease, Insects and, 90
Disinfection of Water, 262
Diversion of Highways, 114
Drain Pipes: What are Good, 380
Drains, War Minister and, 203
Drifting Sand Problem at Rhyl, 164
Dublin Electricity Supply, 421
Dublin Municipal Workshop, 538
Dublin, Replanning of, 26, 114, 190, 227, 327, 351, 470
Dumfries County Buildings, 84

E

Earl's Colne Bridge, Essex, 146
Earth Pressures, 471, 517
Eastbourne and its Street Trees, 374, 380
East Suffolk, Motor Transport in, 164
East Suffolk Roads, 167
Economical Sewage Filter-bed Construction, 376
Economic Town Planning, 24, 39, 50
Edinburgh Housing, 182
Edinburgh Municipal Economies, 86
Edinburgh Tramways, 389, 470, 536
Electricity Charges and Summer Time Act, 23
Electricity, Gas Authorities as Suppliers of, 201
Electricity Supplies, Linking up of, 95, 168, 326
Electricity Supply, Gas and, 349
Electricity Supply in Dublin, 421
Electric Vehicle Tests of Road Surfaces, 137
Electric Vehicles in Municipal Work, Use of, 62, 69
Electric Vehicle Trial at Manchester, 351, 352
Electric *v.* Cable Traction, 470, 503
Electrolytic Disinfecting Fluid, 178
Electrolytic Sewage Disposal, 150
Engineer and the Future, 225
Engineering Education, 158, 374
Engineering, Obstacles to Success in, 421, 426
Engineer, Silence of the, 273
Excreta Disposal in the Tropics, 245
Exmouth Sea Front Improvement, 96, 131
Experience with Wooden Water Pipes, 247
Experimental Research with Road-making Materials, 439
Experiments on Earth Pressures, 517
Extraordinary Traffic: The Surveyor's Certificate, 537

F

Ferro-Concrete (see Reinforced Concrete)
Filtration Plant at Lancaster, Water, 4
Fine-grade Filters, Experience with, 28
Firemen, Part-time, 251, 294
Fish Life, Road Tarring and, 36, 163, 316, 494
Flooring, Keyed Wood Block, 416
Future of Granite Macadam and Concrete Roads, 448, 482, 502, 525, 548, 580

G

Gas and Electricity Supply, 349
Gas Authorities as Suppliers of Electricity, 201
Gas Standard Bill, 29
Gas Undertakings, Position of, 287
Germans and Cremation, 214
Glamorganshire Ferro-Concrete Bridges, 376
Glasgow Cleansing Department, 171, 254
Government Departments and Reinforced Concrete, 375
Granite Macadam and Concrete Roads, Future of, 448, 482, 502, 525, 548, 580
Gully, The Insanitary, 206

H

Hampstead Demolition Order, 91
Health, The War for, 440
Heating and Ventilation, 446, 459
Herefordshire Main Road Control, 126
Herefordshire Road Maintenance, 39
Higher Engineering Education, 158
Highway Surveyors' Salaries, 205
House Drainage, 2
House Refuse Removal by Electric Vehicles, 69
House Refuse Utilisation, 308, 375, 393, 493, 496

Housing and Town Planning:—
Architects and Slum Areas, 425
Birmingham Housing Proposals, 202
Civic Study in Civic Design, 1, 8
County Councils and Housing Loans, 429
Development of Hilly Sites, 451
Dublin Re-planning, 26, 114, 190, 227, 327, 351, 470
Economic Town Planning, 24, 39, 50
Edinburgh Housing, 182
Greenock Housing, 477
Housing and Economics, 297, 336, 362
Housing Needs, 503
Housing the Munition Worker, 597
Increased Prices and Housing, 539
Irish Housing Problems, 250
Liverpool Housing, 134
Local Government Board Report, 135, 136
London County Council Housing, 3
Manchester Civic Survey Exhibition, 381
Mid-Lanark Housing Scheme, 297, 336, 362
Mud as a Building Material for Cottages, 36, 72
New Advocate of Housing Reform, 75
Obligatory Town Planning, 9, 21, 22, 25, 38
Opportunities in Town Planning, 347
Planning of Munition Workers' Houses, 209
Post-War Problems, 595
Private Enterprise in Housing Reform, 471
Public Utility Societies and Housing, 374, 384, 432
Rosyth Housing, 590
Scottish Congress, 515, 533
Scottish Housing Commission's Report, 383
Scottish Local Government Board's Report, 58
Town Planning and Business, 358
Town Planning of Greater London After the War, 456, 469, 502, 533, 585
Trades Unionists and Housing, 220
War and the Housing Problem, 231, 266, 275
Watford Housing Scheme, 333
Welsh Town Planning, 451
Hull's Petrol Substitute, 34
Hydraulic Methods in Earth Dam Construction, 298
Hydraulic Mining Cartridge, 111
Hypochlorite Sterilisation of London Water, 513, 518

I

Improvements, The Commercial Value of, 115
Improvements of Highways, 55, 60, 73, 85
Increased Prices and Housing, 539
Insanitary Gully, The, 206
Insects and Disease, 90

Institute of Cleansing Superintendents:—
Annual Conference at Cardiff, 50, 52, 57, 62, 65, 69, 81, 87, 105

Institution of Civil Engineers:—
Meetings, 475, 517
Presidential Address, 421, 426

Institution of Municipal and County Engineers:—
A Bequest, 485
Annual Dinner, 11
Annual Meeting at Blackpool, 4, 5, 6, 8, 21, 22, 24, 25, 31, 33, 55, 60, 76, 85, 101, 107, 116, 121, 170, 192
Bristol Meeting, 260
Council Meetings, 457, 586
Disappointed Authors at Blackpool, 3
Exmouth Meeting, 96
Manchester Meeting, 381
Melton Mowbray Meeting, 280, 286
Nominations for Council, 549
Orphan Fund, 3, 12, 72, 92, 399, 586
Sheringham Meeting, 98, 100
Stowmarket Meeting, 269, 310, 317
Watford Meeting, 331, 355, 368
Wath-upon-Dearne Meeting, 297, 303, 309, 319, 321
Worthing Meeting, 491, 492, 495

Institution of Municipal Engineers:—
Council Meetings, 23, 314, 404
Gloucester Meeting, 313
Visit to Windsor Waterworks, 23

Institution of Sanitary Engineers:
Meetings, 440, 526, 552

Institution of Water Engineers:—
Summer Meeting, 1, 15
Winter Meeting, 540, 546, 559

Ireland and Road Board Grants, 318
Ireland, Security of Tenure in, 183
Irish Housing Problems, 250
Irvine and District Waterworks, 165
Islington, Motor Sweeping at, 489

J

Johannesburg, Building Work in, 216
Johannesburg Sanitary Services, 168
Johannesburg Swimming Bath and Wash-houses Scheme, 209

K

Keighley Trackless Trolley System, 24
Kent, Road Maintenance in, 455
Keyed Wood Block Flooring, 416

L

Lancaster Mechanical Water Filtration Plant, 4

Law Notes:—
A Building Line Difficulty, 373
Animals Straying on the Highway, 94
Building Lines, 567
Drain Pipes, 380
Extraordinary Traffic: The Surveyor's Certificate, 537
Highway Obstruction: Liability for Accident, 134
House Drainage, 2
Isolation Hospital: Powers of County Council, 149
Liverpool Sewer Contract, 498
Local Authorities and Defence Regulations, 580
Motor Omnibuses on Country Roads, 455
Motor Traffic over Railway Bridges, 74
Private Bill Legislation and Common-Law Rights, 181
Repair of Railway and Canal Bridges, 157
Responsibility for Subsiding Footpaths, 570
Substitution of Water-closet for Pail-closet: Work Done by Local Authority: Damage to Premises: Liability, 217

Law Queries and Replies:—
Bridge Crossing Highway, 388
Building By-laws, 217, 290
Building By-laws: Additions, Exempted Buildings: Surface-Water Drainage, 529
Building By-laws: Air Space, 59
Building By-laws: External Wall, 388
Building Line, 411
By-law, Infringement of, 388
Cinema: Building By-Laws, 149
Combined Drainage, 411
Combined Drainage: Flooding, 411
Defective Closets—Drain and Yard Paving, 529
Extraordinary Traffic, 529
Footpath, Projection Over, 388
Highway: Materials for Repair, 529
Highway: Projecting Covers, 411
Highway Repair: Motor Traffic, 59
Highway Retaining Wall: Danger to Children, 59
Highway: Straying Poultry, 59
Highway Subsidence, 388
Housing, Town-Planning Act, 1909: Closing Order, 290
Injury to Surface of Highway by Studs in Horse-shoes, 290
Military Service, Payment to Servant of Local Authority on, 529
Nuisance by Noise: Procedure to Remedy, 59
Refuse Tip: Compulsory Purchase, 149
Road Wastes, Ownership of Trees on, 412
Salary, 411
Surface Repair, Materials for: Quarrying and Lordship, 149
Tar-spraying, 217
Water-closets and Ashpits, Insufficient, 290
Water Main: Damage to Highway, 217
Works: Building By-law, 149
Leakage from Water-pipe Joints, 386
"Leather" Bacillus, 571
Leeds, Sewage Disposal at, 34, 449
Lighting Schemes, Lay-out of, 401
Lighting, War Economies in, 589, 601
Liverpool Sewer Contract: Corporation's Action Against Contractors, 498
Liverpool Water Supply, 84
Loans to Local Authorities, 299
Local Government Board Inquiry Expenses, 316
Local Government Board for Scotland: Annual Report, 58
Locking Nut, New, 562
London Arterial Roads Scheme, 49, 399, 410
London (City) Refuse, 509
London County Council Housing, 3
London of the Future, 26
London Tramways Deficit, 51
London Water, 302, 497, 513, 518

Lower Thames Valley District Surveyors' Association:—
Annual Meeting, 382

M

Macadam Road, Destruction of a, 73, 76, 101
Magic of Sewage Disposal, 297
Management of Sewage Disposal Works, 201
Manchester Civic Survey Exhibition, 381
Manchester Drainage, 312
Mathematics, Sanitation and, 398
Measures, British and American, 214

Mechanical Traction:—
A Word to Manufacturers, 54
Battery Vehicles at Ipswich, 387
Bedfordshire, 425
Bristol, 177
Coal Gas for Road Traction, 395
Cumberland, 409
Discussions at Cleansing Superintendent's Conference, 81, 105
Electric Vehicles for Surbiton, 594
Electric Vehicle Trial at Manchester, 351, 352
House Refuse Removal by Electric Vehicles, 69
Limitation of Loads, Speed and Size, 478
Mechanical *v.* Horse Haulage, 127, 148, 232, 249, 254, 256
Motor Sweeping at Islington, 489

Mechanical Traction (*continued*):—
Nottinghamshire, 409
"Orwell" Electric, 195
Petrol and Steam Wagons in East Suffolk, 164
Petrol Lorry Costs in Bedfordshire, 425
Recharging Stations for Electric Vehicles, 178
South Shields, 254
Steam Haulage, 293, 409
Steam Tractors for Cleansing Work, 65, 127
Straker-Squire Tipping Wagon, 293
Street Cleansing Results, 52
Street Watering with Electric Vehicles, 62
Melton Mowbray, The Municipal Works of, 280, 286

The Surveyor

And Municipal and County Engineer.

Vol. L. JULY 7, 1916. No. 1,277.

Minutes of Proceedings.

The Alignment Diagram Applied to Water Mains.

In the present state of our knowledge the engineer has to learn at an early stage that theory is not always in accordance with practice. Experience rather than theory is our guide in many matters, and the world abounds in examples of structures which are apparently lacking in stability, by all the accepted rules, and which nevertheless serve their purpose satisfactorily, and with others which have to be made far stronger than plain theory would lead us to expect. The knowledge that our theory is incomplete and does not take all the facts of the case into account helps us very little, and merely shows the need for a great deal of work based upon an endless series of experiments and observations. Every work and discussion which has for its object the advancement of our knowledge of theoretical matters is to be welcomed, particularly when it results in something tangible which will be of immediate use to the engineer in his daily work.

Hydraulic calculations are certainly among the most satisfactory work that an engineer is called upon to do. It is both interesting and pleasant to calculate the discharge of a main or series of mains and to be able to check the result by actual measurement, to find that the expected volume of water is delivered, that an exact pressure is obtained, and that the jet of water thrown by a certain hydrant reaches a certain expected level. If such results are obtained, one is tempted to think that here at least theory is very complete. One has only to study an ordinary text-book, however, to be surprised at the number of formulæ giving different results and to examine the record of experiments made of the flow of water through mains in ordinary practice to see that there are a very large number of factors such as corrosion and incrustation which may soon upset any ordinary calculation, while the variety of possibilities in a complicated system will often present a problem the solution of which is by no means easy. The water engineer has therefore to guard against any assumption that the rules which were applied to any one case satisfactorily will necessarily apply to another. Where such calculations have to be made the water engineer generally uses a diagram of one kind or another showing the rate of flow, the diameter of the pipe, and the hydraulic gradient.

Mr. D. Halton Thomson, in an excellent paper read before the Institution of Water Engineers, brings forward an amplification of the diagram method which should certainly be very useful. The paper was published in these pages in our last issue, and shows how the alignment diagram may be applied to the flow of water in uniform and in compound mains. The author does not claim to have introduced this application of the alignment diagram, though the matter does not appear to have been brought very prominently before water engineers before. He has, however, done this, and he has extended its use to compound mains, giving us at once something which was much needed; for, while it is a fairly simple matter to deal with the problem presented by a simple main, it is always rather a long and tedious matter to work out the discharge from a series of mains of varying diameters. The extension is made possible by taking advantage of the principle that any combination of mains may be replaced by a single imaginary equivalent main of the same discharge and loss of head. A diagram is constructed having six vertical parallel axes, five of which represent the variables of pipe flow given in the general formula for flow of water in pipes, and the remaining axis is that of "carrying power," which is of use in comparing single uniform mains and in calculating the flow in compound mains. In this diagram the law of the scales and their relative magnitude and position are such that when any straight line is drawn across them the points of intersection on each of the scales will be such that if any two variables on a system are known the line drawn through them will cut the scale of the third variable at its corresponding value. Thus by merely drawing lines or applying a straight-edge to the diagram the unknown quantity, be it discharge, diameter, carrying power, hydraulic gradient, loss of head or length, may at once be found. The author explains the use of his diagram very clearly by means of examples, and very little study of the paper will enable the engineer to test its value. It is necessary to note that the diagram is based upon the use of certain constants, depending on the internal condition of the pipes, and that these apply to uncoated cast-iron pipes the internal condition of which causes, for any given rate of discharge, a loss of head about 30 per cent greater than that in new pipes. The adoption of such constants will not apply to all cases.

* * *

Civic Study in Civic Design.

Prof. Abercrombie has done so much for the promotion of town planning, both as a lecturer at Liverpool University and as editor of the *Town Planning Review*, that anything he has to say on this important branch of municipal work is entitled to careful consideration. In his paper on "Civic Study in Civic Design," read at the annual meeting of the Institution of Municipal and

County Engineers at Blackpool, he commenced by tilting at our national habit of embarking on great undertakings without adequate preparation, and no one will dispute that, however successful we may eventually be, our habit of "muddling through" is costly and wanting in method. While, however, we have on the one hand complaints that we are undertaking town planning schemes without proper study and preparation, on the other hand we have demands made that, despite this want of study, town planning should be made obligatory. Town planning has not been so long the fashion, and the times are so much out of joint for the preparation of schemes that we should not be unduly perturbed that our councils are not able to keep pace with these enthusiastic civic reformers, or that the demand for war economy should prevent them going in for extensive schemes. There will be general agreement with Prof. Abercrombie's ideas as to the methods of study to be adopted by those who have to prepare a town planning scheme. As Prof. Abercrombie admits, these methods are usually, if unconsciously, adopted by town planners, and with satisfactory results, but a satisfactory result can only be obtained where the designer has an intimate knowledge of the district he is planning or has obtained the requisite data by means of a formal civic survey.

The need for being able to control the planning in the outlying districts of our large towns was emphasised in the course of the discussion by Mr. Stilgoe, who has found the area of 43,000 acres in Birmingham insufficient for the proper development of his arterial roads. It is now very generally admitted that it is of little use planning a wide arterial road within a borough, or two neighbouring boroughs, if the adjoining districts will not come into line and widen their roads in accordance with a comprehensive traffic scheme. A comprehensive plan which will embrace a number of neighbouring districts is particularly desirable for traffic purposes, and in many cases it ought to include the provision of open spaces, water supply, and sewage disposal, instead of allowing a large number of small local schemes. That a large general plan on these lines should be prepared being admitted, there remains the question as to who is to prepare it. Prof. Abercrombie, as an architect, naturally favours the example of the London society, or commissioners such as those appointed at Chicago and Ottawa, in which the leading spirits are architects and business men, and the municipal engineer is relegated to a back seat. That municipal engineers will be content to accept such an undignified position can hardly be expected when one remembers the pioneer work done by such men as Mr. Brodie at Liverpool, Mr. Stilgoe at Birmingham, and Mr. Thomson at Dundee. As Mr. Shawcross pointed out in the opening of his paper, the planning of roads will always be the most important practical part of a scheme, and this is essentially the work of the engineer, and the nation will have to rely for its town planning schemes more on the engineer than the architect. Both engineer and architect have their proper place in town planning schemes, but it is the engineer who will have to prepare the general layout, and the architect must develop and clothe the framework provided by the engineer by designing the national, municipal and other buildings which so largely give dignity and character to our towns and cities.

* * *

House Drainage.

An interesting case which was heard recently in the High Court raised a question as to the power of a local authority to enforce the drainage of a house under sec. 23 of the Public Health Act, 1875. It will be remembered that that section provides that where any house within the district of a local authority is without a drain sufficient for effectual drainage, the local authority shall by written notice require the owner or occupier of the house to make a covered drain emptying into any sewer which the local authority are entitled to use which is not more than 100 ft. away, but that if there is no sewer within that distance, then emptying into such covered cesspool or other place not being under any house as the local authority may direct. The question raised by the case *(The Chelmsford Corporation* v. *Bradridge)* was as to whether, in the absence of a sewer within the prescribed distance, the power of the local authority to enforce drainage is limited to cases where there is an existing cesspool, or whether they can enforce the construction of a new cesspool if that be necessary. The respondent Bradridge was the owner and occupier of Springfield Mill, and a notice was served upon him requiring him to make a covered drain emptying into a covered cesspool in pursuance of sec. 23. He failed to comply with the requirements of the notice, and thereupon the work was executed by the corporation and he was summoned for the recovery of the expenses. The justices before whom the case was originally heard dismissed the summons, and the corporation now appealed. The appeal was allowed, the judges being unanimous in deciding that the powers of a local authority under sec. 23 are not confined to the case where there is an available covered cesspool in existence, but that they may give notice to the owner of the house requiring him to make the covered drain emptying into a covered cesspool to be constructed, and, upon his failure to comply with the notice, may themselves construct a covered drain and covered cesspool and recover from him the cost of so doing. Although the Public Health Act was passed so long ago as 1875, the point decided in this case appears to be an entirely novel one. As Mr. Justice Avery pointed out, if the decision of the justices had been allowed to stand the result would have been that in a large class of cases the powers conferred by sec. 23 to enforce the drainage of premises in the interests of the public health would have been reduced to a nullity. The decision is one of great importance to sanitary authorities, and should be noted by surveyors.

* * *

Parliament and Charing Cross Bridge.

The rejection of the railway Bill for the strengthening of Charing Cross Bridge did not come as a surprise, for happily the way had been well prepared by a volume of informed protest to which it is only reasonable Parliament should pay due attention. There can be no question about the ugliness of the bridge, nor need the point be laboured that the Charing Cross site with its over-congestion is a defacement of one of the most important parts of London. Nothing less worthy of an historic spot, with its teeming railway station and its sordid appendage in bridge form, could well be imagined, and we are forced to the conclusion of Mr. John Burns that if the nation had possessed some public department akin to a Ministry of Art such a Bill as that presented to the House of Commons on Monday last would have been impossible. The alternative to the existing régime is to deal with the site in a manner worthy of London's architectural future, and we note in this connection that the suggestion of Mr. Lewis Hind of a war memorial has received the qualified support of our contemporary the *Builder*, which remarks that the suggestion to remove Charing Cross to the southern side of the river and to make a great monumental footbridge to commemorate the present war is a proposal which calls for full and impartial consideration after the war. The possi-

bilities of such a scheme are set forth in a sketch in the *Builder* by Mr. D. Barclay Niven, F.R.I.B.A., and Mr. T. Raffles Davison, Hon. A.R.I.B.A. This shows a vehicular bridge that would supplant the present unsightly structure, a commanding "Place," or square, on which streets converge, a flanking boulevard with gradients to the Victoria-embankment—to which Hungerford Bridge is a positive blemish—and a war memorial chapel, suggested by Mr. Lewis Hind, in the centre of the "Place." Incidentally, we may express a hope that the removal of the terminus to the south side of the Thames will also cast upon the railway company the responsibility for providing some worthier structure than the motley congeries of buildings which represent the Waterloo Station. These are, however, questions whose consideration may well be left till the after-war period. At present it is a satisfaction to know that Parliament has declined to set the seal of permanence upon Hungerford Bridge and the unæsthetic agglomeration of brick and mortar at Charing Cross.

* * *

The Orphan Fund.

The annual report of the committee entrusted with the management of the Orphan Fund of the Institution of Municipal and County Engineers is always an interesting document, although in one aspect it is usually of a disappointing character. We refer, of course, to the comparatively small proportion of the total number of members who make any subscription to the fund. The year dealt with by the report which has just been issued is the seventeenth year of the fund's existence, but out of a total of 1,797 members of the institution it contains the names of only 217 subscribers and a list of twenty-five donations. It is true that the amount of subscriptions shows a small increase upon the sum collected during the preceding year, and this in spite of the many additional claims which have to be met at present in connection with war charities. This is satisfactory so far as it goes, but we feel bound to point out again, as we have done with regularity for some years past, that the value of such a fund is not measured by the number of large subscriptions received, nor even by the number of cases in which relief is granted. It should rather be regarded as a means by which every member of the institution may contribute his share, however small, towards the relief of the dependents of those of his professional brethren who have fallen by the way. We feel sure that those who are immediately responsible for carrying on this important and beneficent work would be immensely cheered by a large increase in the number of small subscriptions. It may be that some organisation could be started for effecting this object through the several districts. At any rate, the matter is worth consideration, and if it were ventilated it would at least serve to keep the claims of the fund before the members and to secure that its work will not be forgotten until the time comes for the next annual meeting.

* * *

Disappointed Authors at Blackpool.

The three papers on town planning which were presented at the annual meeting of the Institution of Municipal and County Engineers at Blackpool last week proved of such interest to the members that the whole of the Thursday afternoon was taken to discuss them. This unfortunately led to the crowding out of several very interesting and valuable papers which, had time permitted, would no doubt have evoked an equally useful discussion. Unhappily, the process of elimination was repeated at the closing sitting on the following morning, when, out of a further six papers, only two, dealing with road matters, came under discussion. Among the seven which were thus left undiscussed were papers on such important questions as security of tenure, road signs, sanitation problems in civil areas in the vicinity of temporary military camps, public abattoirs, and diagrammatic statistics for municipal engineers, and when it is remembered that probably in every instance these contributions were prepared in face of serious difficulties created by reduced staffs it is not surprising that there is a feeling of resentment among the authors that the time and labour spent on their tasks should, apparently, be so little appreciated. For several years now the number of papers has been growing, and it is clearly time that the council of the institution took steps either to limit the number to be discussed or provide more time for their adequate discussion. To say the least, it is distinctly annoying for a man to prepare a paper for discussion and then find that there is no opportunity of discussing it.

* * *

L.C.C. Housing.

Although the fact that in the past some housing schemes have been carried out without involving any charge on the rates does not show that this desirable result can be produced with labour and materials at their present prices, it is always instructive to examine the financial results of a successful undertaking. The London County Council of course occupies a unique position as a housing authority owing to the magnitude of the operations which it has undertaken. But, even when this is taken into consideration, it will be generally agreed that Sir John Benn was fully justified at the last meeting in congratulating the council upon the present position. A surplus of £26,577, to be devoted to relief of rates, is anticipated as a result of the past year's working. The nett surplus on all dwellings and estates in course of development was £11,610, as compared with £14,393 in the previous year and £15,877 in the year before that; but the extra cost of lighting, heating, insurances, taxation, war bonuses, and allowances to officers and employees serving with the Forces account for the decrease. The total capital expenditure of the council on its working-class dwellings and estates amounted, at March 31st of this year, to £3,080,814. Sir John Benn, in dealing with the report, pointed out that what is most satisfactory is that, in addition to providing necessary and healthful accommodation for the working classes, the council have been able to secure a substantial and reasonable dividend; and, further than that, this magnificent property is gradually becoming the property of London.

* * *

A Tactless Proceeding.

We quote elsewhere *verbatim* the excellent editorial which appeared in the *Surrey Comet* of Saturday last under the heading "A Tactless Proceeding." We have omitted the name of the councillor concerned, as he, as a personality, doesn't matter. He is a type, and unfortunately there are hundreds of him scattered about among our local authorities. They are the pin-prickers—the little insignificant stinging insects of municipal life. Out of a molehill they are quick to make a mountain; their perverted instinct tempts them even to rear their mountain without even a molehill for its basis. Fortunately in this case Mr. Hampton Clucas is immune against such retailers of tittle-tattle, safeguarded as he is by the confidence and esteem won by his conspicuously able and loyal service as an official. But it often happens that a surveyor is not so strongly fortified against such attacks by innuendo, and he may accordingly suffer mentally and materially. We cannot therefore protest too vehemently against this sort of "tactless proceeding" in public life.

C*

Mechanical Water Filtration Plant at Lancaster.

By ARTHUR G. BRADSHAW, F.S.I., Borough and Water Engineer.

The plant consists of No. 12 8-ft. diameter Bell's vertical pressure filters, with full apparatus for chemical treatment. The raw water dealt with is collected from a moorland gathering ground into a storage reservoir of 130,000,000 gallons capacity. The site of the plant is situated 1½ miles from and 200 ft. lower than the reservoir, the filtered water being passed on for consumption without any further period of storage. The introduction of a service reservoir to contain a day's filtered supply was not considered feasible, owing to the loss of head which would have taken place, otherwise the filters would have been erected below the reservoir embankment, and under which circumstances the plant required would have been smaller, owing to the fact that an average daily output only would have been required, instead of a maximum hourly supply as now installed. The necessity for the plant was occasioned by a serious growth of algæ in the storage reservoir, resulting in the stopping up of service pipes with a matted, stringy, fibrous substance composed chiefly of dead filaments of vegetable matter. On one occasion after repairs to a fractured main as many as forty service pipes were blocked at one time.

The storage reservoir, owing to its somewhat large surface area (22 acres) in comparison with its storage capacity (130,000,000 gallons), lends itself in hot weather to the growth of algæ and minute forms of water life. A certain amount of peat discoloration had also to be dealt with. Examinations of the raw water for bacteria showed variations between the best and worst results which were not entirely negligible, more especially after a dry period, followed by a flushing of the catchment area in times of heavy rain. The period of sedimentation to which the water is subject while in storage renders the duty of the plant somewhat easy in comparison to many waters dealt with by mechanical filters.

The plant was set to work early in 1913, and has been in continuous operation since that time. The results obtained have been satisfactory, the filtered water showing a high degree of purity both chemical and bacteriological, and in some instances a sterile water has been obtained, the trouble with service pipes having been entirely eliminated. The plant from the mechanical point of view has worked successfully, and beyond the renewal of the water turbine worm and gear wheels which operate the connecting rods of the alumina injection pumps, has required little or no alterations or repairs.

The standard solution of aluminoferric is injected into the main by small ram pumps operated by water turbines, which are driven and governed by the flow of water used in the ordinary course of consumption. As the point of injection is situated below the turbine wheels, the solution is effectively scattered and mixed with the raw water before it passes to the filters, to be deposited on to the sand beds, and there in combination with lime water forms a flocculent gelatinous matter (alumina hydrate), or coagulant, in which the various insoluble impurities are entangled. No direct method of measuring the alumina solution is in operation. The solution is standardised by dissolving a known weight of aluminoferric in a given quantity of water. From this and the total recorded amount of water passed in twenty-four hours the grains used per gallon can be fairly accurately calculated.

The number of strokes made by the injection pumps being governed by the speed of the motors, which in turn is governed by the rate of the raw-water flow in the main, the amount of solution injected is proportionate to the flow. Facilities are also provided for varying the length of the stroke of the injection pumps when in motion, thus giving a finer adjustment of the amount of solution used, and which is necessary when a raw water of varying quality or colour is dealt with.

Lime water is stored in a large vertical tank, and maintained at the required strength. The extremities of this tank are connected to the throat and upstream end of a Venturi tube on the main, and by which under the Venturi law of pressures the raw water is enabled to take up lime water proportionate to its flow. The lime flow may be varied by operating a valve on the pipe connected to the throat of the Venturi tube. The actual quantity of lime passing into the raw water can be calculated at any time by reference to a manometer, and the rate of raw water flow as recorded by a Venturi meter. The manometer can also be coupled up to the meter pressure pipes, and with the aid of a graduated scale its accuracy can be tested. The method of washing out the filters is too well known to be described in detail. A manipulation of valves enables a reverse flow of water to put the sand bed into suspension, revolving arms radiating from a central column cause the sand in one operation to be raked, disintegrated, and violently sprayed.

In the case of a single filter a reverse flow at the rate of 16,000 gallons per hour has been found sufficient to disturb the bed without losing sand. A recorder is provided for ascertaining the amount of wash water wasted. This is operated by passing it over a V notch and by the usual method of a float, a clock with electric movement, and a diagram the amount can be computed. A bell arrangement warns the attendant when the flow of wash water exceeds the prearranged amount. The wash arms are rotated by a 2½-b.h.p. Tangye oil engine, each filter being engaged separately by means of a clutch, or, if required, two filters can be washed in one operation. The time occupied in washing the twelve filters varies according to the dirtiness of the beds; if done daily an average of about forty minutes is necessary. The beds are washed out as frequently as loss of pressure demands. Gauges show the total loss on the plant and also the loss due to the congestion of the beds. This loss varies according to the quality of the raw water; in our case it may be taken as 3 to 6 lb. after twenty-four hours, 10 after forty-eight hours, and 15 after seventy-two hours.

As a flow of 25,000 gallons per hour is necessary to keep the turbines working, it was thought advisable to install an arrangement whereby alumina could be added to the raw water on the Venturi principle described in the case of lime water. Governors driven by the turbine shafts were made to operate a tap controlling a subsidiary alumina solution supply. Whenever the turbines slowed down sufficiently for the balls to loose their spread the tap was automatically opened and *vice versa*. Night consumption has since increased sufficiently to render this arrangement unnecessary.

As a result of the working of the plant I am of opinion that the alumina tanks should be constructed of concrete or of iron, lined with bricks. A third tank would be an advantage. The lime chamber should be in duplicate. All pipes conveying chemicals should be copper, controlled by screw-down valves of the best quality obtainable. Jet nozzles, perforated strainer tops or boxes, and any small collecting pipes in the base of the filters should not be liable to corrosion. Test bowls continuously supplied with raw and filtered water should be in a light and prominent position, so that the attendant always has them in view. The filter-house should be heated, and one Venturi meter is essential.

In practice it has been found that with a good raw water the filters, if washed out daily, are each capable of dealing with an average of about 5,500 gallons per hour without any serious loss of pressure.

The average daily amount of water dealt with is 1,000,000 gallons. The filter and appliances have been disposed so as to avoid pipes crossing the walls and in which there is no special advantage save from a neatness of appearance point of view. From the figures given below it will be noted that the cost of housing the installation was somewhat small in comparison to the cost of the plant. It has been observed in some plants which have been visited that there is a tendency to spend money rather lavishly on the housing, so much so that in odd cases the house has cost almost as much as the plant. Much of this expenditure appears to be unnecessary for proper and efficient working, and can hardly be claimed as having any material effect on the results to be obtained.

Analyses of samples of the raw and filtered water should be frequently made, and in this respect it will be of great assistance when analysts are able to submit the results of their investigations in some recognised standard form. Additional competition in the

sale of suitable alum meterie is also desirable. Frequent tests for alkalinity or acidity should be made, either with lacmoid or phenol phthalein.

Generally, the opinions which have been expressed to me to time regarding the defects of mechanical filters, as compared with open sand filters, have not been found to exist in the working of the plant. Re-wash pipes were installed for the purpose of running a certain amount of water to waste immediately after washing out, in order to allow the beds a little time to coagulate. This operation may be required where a bad raw water is dealt with, but it has not been found necessary in this case. A bright, clear water, capable of undergoing close examination, has been obtained at all times. A careful and intelligent man is necessary to look after the plant, and the records of its working should be systematically kept and scrutinised.

Average amount of aluminoferric used, half a grain per gallon.

Average amount of lime used, one-tenth of a grain per gallon.

Total cost of running the plant for year ending March 31, 1916, apart from interest and redemption of capital, £150, or 8s. 2d. per million gallons treated.

Amount of water lost in washing out, three-quarters of 1 per cent.

Cost of the plant, £4,000, and land, buildings, meter, &c., £1,500.

Wages of attendant, 36s. per week.

Price of aluminoferric, 1913, £3 2s. 6d. per ton.

Price of aluminoferric, 1916, £5 7s. 6d. per ton.

Hardness of raw water, 2 deg. (Clarke's scale).

CIVIC STUDY IN CIVIC DESIGN.*

By PATRICK ABERCROMBIE, M.A., A.R.I.B.A.,
University of Liverpool.

Into town planning as a general subject it cannot be said that this country plunged without very considerable preparation. Ten years before our Act was passed organised visits had been paid to the Continent, where the practice of civic design had not been suffocated by the industrial revolution, as with us, and before anyone got to work on actual schemes several general treatises had been published, and at least one notable Continental report issued by a municipality.

But it is in the conduct of individual town planning schemes under the Act that some tinge of our national habit of unpreparedness appears; the very nature of the Act itself, which proceeds by means of individual schemes, isolated by red lines, appears to encourage a piecemeal treatment of the subject, and the intricacies of a new piece of legislation naturally tend to a preoccupation with the statutory stages of its procedure. At none of these stages is there any necessity to discover what preparation of general considerations have preceded the particular scheme, except in so far as it is obligatory to show that the land is likely to be developed in the near future. That such preliminary thought is given in many cases is undoubted; but it may not be amiss to attempt to methodise the natural progression of study under which town planning must proceed, if full justice is to be done to the complexity of the problem and that degree of comprehensiveness attained which is the distinctive difference between town planning of the present day and in the past. There is no claim that the method to be set forth is an original or novel suggestion: it has certainly been adopted by many of those who have produced schemes under the Act; but few will deny that it has been applied unconsciously rather than as an ordered method of progress.

The three stages, then, to be considered are: (1) The civic survey, (2) the comprehensive town plan, (3) town planning schemes for definite areas. It is easy to think of a case where this threefold progression has been adopted unconsciously with satisfactory results; a small isolated country town, whose growth has been somewhat quickened of recent years, decides to make use of the Town Planning Act for the third stage—a scheme for a definite area. The matter is in the hands of the borough surveyor, who, knowing his own town as every borough surveyor, of course, does, sees no need for the production of a formal civic survey or general town plan, for the simple reason that both these exist at the back of his head, his town is of a size easily graspable without graphic representation—he knows which roads are adequate for the traffic and which are not—how much overcrowding there is—the relation between his proposed improvements and land values—and, as to open spaces, he is aware that the country is within a few minutes' walk of everyone.

INDUSTRIAL DEVELOPMENT.

But our old-fashioned market town may be in a more definitely transitional stage, threatened with an industrial development which it does not wish to avert but at the same time was quite happy without. Suppose it to be at the same time an ancient cathedral city, owing a large part of its prosperity to its attractiveness to visitors; its four main cross-roads lined with old buildings, an asset of permanent value; trams have been laid on the cross-roads, but all thought of widening is out of the question. Another cause of the city's prosperity is a river much used for pleasure parties. Upon this peaceful, prosperous community, battening on Americans and visitors from distant industrial centres, has descended a sudden industrial incursion. Part of this is encamped just outside its municipal boundary, near a convenient waterway; a squalid jerry-built township is springing up in juxtaposition to one of its best residential suburbs; added to this, a large industrial population, working some miles away, prefers to congest the cheerful city's slums rather than to live in the dull country. Here, then, is a case for serious study of existing conditions and a prophetic town plan; it behoves that city to take deep thought for its whole future; it is by no means sufficient to go in for a simple town planning scheme on one side of a protective nature. What is to be done in view of a possible doubled population, and the central streets, not to be subjected to the usual panacea of widening, already congested?

PAROCHIAL TOWN PLANNING.

If the complexity of the problem of this single town suggests the need for general study and planning before separate schemes are initiated, how much the more is this essential in those districts where many towns are found closely associated by community of interests and natural regional conformation? Here it is impossible, or rather municipally immoral, for one town to plan for itself without consulting with its neighbours. South Lancashire, South Yorkshire and the Birmingham district are three such urban agglomerations in which parochial town planning would prove a fatal blunder.

It is not necessary on this occasion to schedule the headings under which a civic survey should be grouped; everyone who has prepared one, whether formally or informally, knows what data are necessary upon which to build town planning, and to what extent the emphasis on different phases varies in each case—for example, the historic aspect sometimes is of first importance, at others practically negligible. But it is worth while pointing out that a civic survey when formally compiled has another use apart from that to which the technician will put it; to the general public a graphic statement of existing conditions will come in many cases as a revelation, and in town planning the backing of public opinion, as epitomised in the eagerness of the Town Planning Committee of the corporation, is of the utmost value. This latter use will amply justify the production of a civic survey for single towns, however familiar its details may be to the official mind.

THE GENERAL PLAN.

For separate municipalities the whole range of town planning activities can be dealt with in the form of general proposals. The great advantage of this general plan stage is that it gives the opportunity for a spark of imagination to lighten up our painstaking, humdrum work. This is much more likely to occur at this stage than while we are engaged in drafting watertight clauses for a scheme, and producing plans designed to give away our intentions as little as possible. And for this reason it is sometimes desirable that this general plan should not be prepared—at any rate if it is to be published—wholly by officials of the city. Another advantage of the general plan stage is that it makes the planner, or the committee of planners, definitely decide upon the type of town for which they are working, so that a form of development in consonance with this type may be encouraged, and no attempt made to impose upon its exotic ideals.

To sum up, it is contended that in large urban agglomerations a civic survey of existing conditions

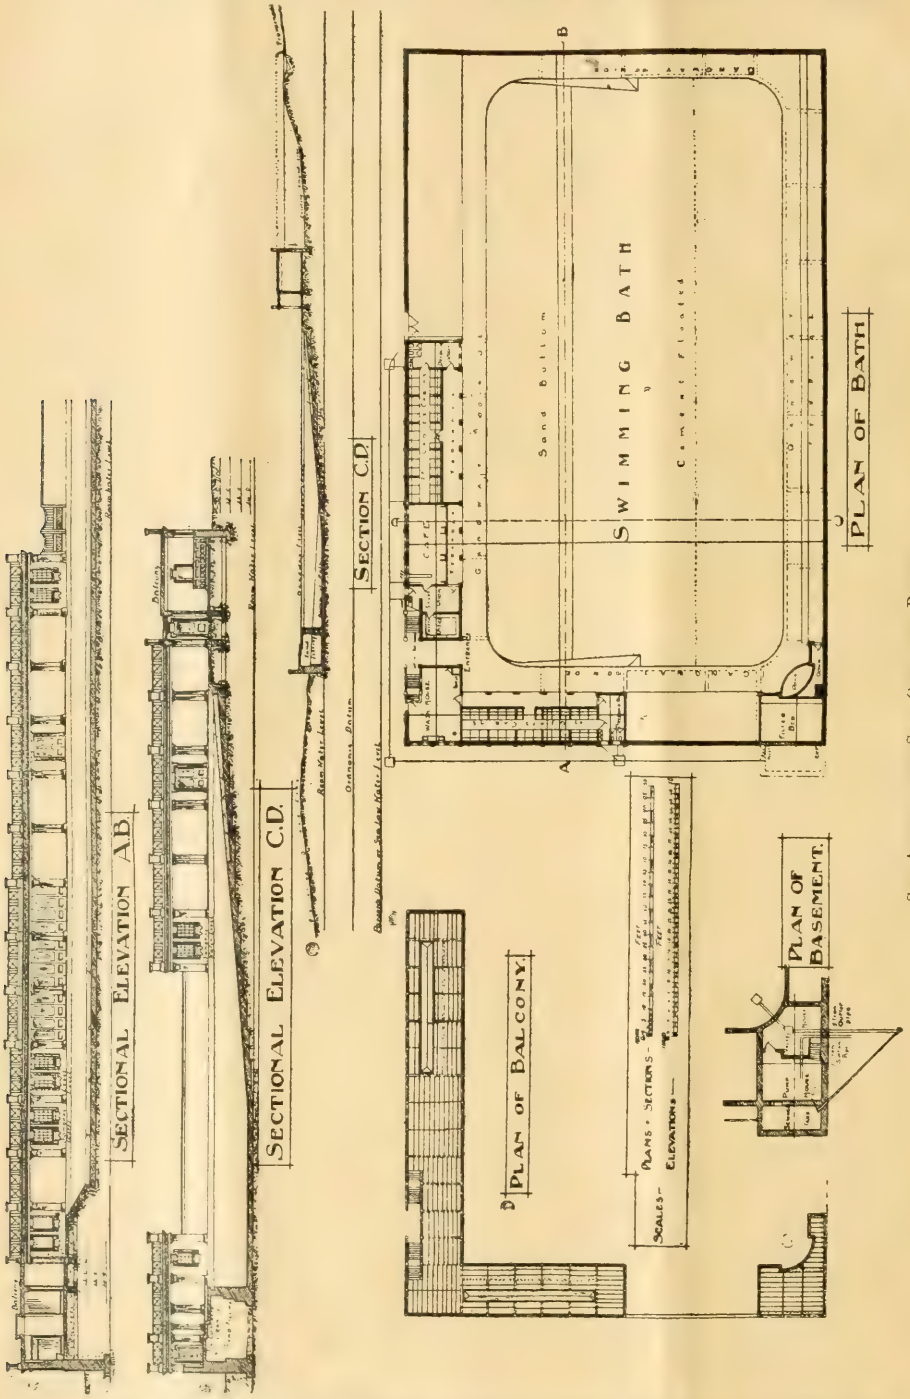
* From a paper presented at the annual meeting of the Institution of Municipal and County Engineers held at Blackpool last week.

and a general plan embodying proposals for certain aspects are essential; and the municipalities concerned should appoint joint committees to draft out the main lines of such a plan, following the precedent of the London Traffic Sectional Conferences; secondly, that a definite adoption of these two stages as the necessary preliminary to town planning schemes under the Act is extremely desirable even for the isolated urban community. Furthermore, the value of publicity at these two earlier stages outweighs its drawbacks.

ST. ANNES-ON-THE-SEA OPEN-AIR BATHS.*

By J. S. Sawdon, Assoc.M.Inst.C.E.,
Engineer and Surveyor to the Urban District Council.

In October, 1913, the council decided to advertise for designs in open competition for laying out the foreshore, including open-air sea-water baths. The first premium was awarded to Mr. Fred Harrison.



St. Annes-on-the-Sea Open-air Baths.

* From a paper presented at the annual meeting of the Institution of Municipal and County Engineers held at Blackpool last week.

M. S. A., architect, St. Annes-on-the-Sea and Accrington, who has designed the baths and supervised their construction, and to whom the author is indebted for many of the following particulars.

The bath is 240 ft. long, 120 ft. wide, and holds 819,000 gallons, weighing 3,750 tons. For a width of 36 ft. the bath is 7 ft. deep, and the remaining 84 ft. are formed with a sloping bottom to a gradient of 1 in 12. Eleven teak ladders are fixed vertically against the walls, and at the ends of the deep portion, and a moulded terra-cotta scum-channel is fixed along the deep side and ends of the bath just above the surface of the water, which also serves as a hand-rail. The scum-channel is connected to the outlet pipe from the bath, and acts as an overflow, so that during the time that the pure filtered sea water is being pumped in at the bottom of the bath the surface water overflows into the scum-channel and thence into the sea. A diving stage is erected on the north gangway with two springboards, one being 8 ft. 6 in. high and the other 15 ft. high. A water-chute is also provided. The buildings have been designed in a simple Renaissance style. The walls are constructed of brick, rendered with Portland cement.

The filtration plant for purifying the sea water before it passes into the bath consists of a concrete filter-tank, 25 ft. long by 17 ft. wide, with a 10-in. distributing pipe on top fitted with five cones for regulating the delivery. At the bottom of the tank is a 10-in. distributing pipe, tapped with forty-eight 1½-in. tapped bosses for carrying the filter tubes, and connected to forty-eight 2-in. copper tubes, perforated with fine holes, and each fitted with gun-metal connector. Brass-lined wedge valves, 10 in. and 6 in., are provided to control the working of the filter.

The filtering material covering the perforated tubes comprises 12½ tons of coarse gravel on the bottom and 23 tons of Norwegian spar.

The water is raised to the filter by means of an electrically driven "Sunturbo" self regulating pump, capable of delivering 30,000 gallons of sea water per hour when running at a speed of 800 revolutions per minute. The pump is directly connected through a flexible coupling to a 10-h.p. shunt-wound motor at 480 volts. The pump and motor are mounted on a massive cast-iron bed plate, and are fitted with a starting panel D.P. switch and fuses.

The water is drawn through an 8-in. iron suction pipe 650 ft. long, and allows about two hours' pumping before high-water and about two hours' pumping after high-water, and is fitted with an 8-in. foot valve. The bath bottom at the deep end is fitted with a cast-iron run-off box 24 in. by 24 in., with heavy brass grid, and controlled by a 12-in. brass-lined wedge valve and connected to 12-in. diameter steel tubes 700 ft. long for emptying the bath.

In order to prevent the discharge of dirty water while the fresh water is being pumped, an electrical appliance is fixed to the run-off valve, which automatically cuts off the current from the pumps when the valve is open.

The promenade and gangways are laid with reinforced granite-faced concrete, and the roofs of the buildings are of solid concrete and iron covered with natural rock asphalt. The dressing accommodation comprises twenty-seven ladies' cabins, with dressing-rooms, fitted with dressing-tables, mirrors and lavatories. A hot-water service is provided to enable each bather to have a hot foot-bath after bathing. Cold shower-sprays are also provided. The accommodation for gentlemen is precisely the same as that for ladies. A café, 33 ft. by 16 ft., is erected with verandah, having folding screens, which can be thrown open if required. A wash-house 31 ft. by 15 ft. is provided with drying closets and electrically driven machines and wash-tubs. Provision has been made for spectators by means of raised terraced seats.

An electrically driven 3-in. centrifugal pump is installed for purposes of pumping sea water from the bath and discharging same into water-carts. It is the intention of the council to use salt water for watering the roads.

With regard to the disposal of sewage, an underground tank is provided, fitted with an automatic electrically driven pump.

Waterproofing of Cement.—St. Mark's Vicarage, at Oldham, which is of stone construction, has been repointed with cement to prevent penetration of considerable dampness. The work has been pronounced as thoroughly successful. The architects utilised the powder "Pudlo" with the Portland cement as a waterproofing medium.

CORRESPONDENCE.

TRANSPORT REFORM.

To the Editor of The Surveyor.

Sir,—I have read Mr. Wood's letter in reply to Mr. Mansfield. As Mr. Mansfield is far away from London and Mr. Wood is in London, it would surely be the best course for Mr. Wood to pay a visit to the British Museum Library and examine the maps there. He would then be in possession of the facts. Mr. Mansfield has stated that there are seventy-four goods stations in London which are not coal yards; he is probably quoting from the list given by me in my lecture at the Royal Society of Arts—a document which may be quite unconvincing to Mr. Wood, but which, as at present advised, I do not see my way to amend.

If Mr. Wood will refer to the Railway Clearing House Official Handbook of Railway Stations, &c., of the United Kingdom, published by the Railway Clearing House, Euston-square, N.W., he will then satisfy himself as to prevalence of opinion as to the existence of these seventy-four goods stations. He will also discover that there are fifty passenger stations in addition to the seventy-four which are used for goods. He will see many other useful items of information to a writer on the subject.

If Mr. Wood had accepted my invitation to the works at Battersea he would have been able to inspect the ground plans of every goods station and coal yard in London. I now renew that invitation in all friendliness.

I have been privileged to read an advance copy of Mr. Roy Horniman's forthcoming book, "How to Make the Railways Pay for the War," and all Mr. Wood's questions and many others are answered therein.—Yours, &c.,

A. W. Gattie.

WHAT IS BITUMEN?

To the Editor of The Surveyor.

Sir,—The Engineering Standards Committee's report upon the classification of asphalts, bitumens and pitches "for road purposes" does not appear to have been very enthusiastically received, and I am tempted to ask if engineers are likely to adopt its recommendations, or will they continue to form their own opinion of what is bitumen and what is not?

The long-standing threat or promise to give petroleum-pitch the better sounding title of bitumen is now apparently an accomplished fact. One can, of course, obtain a considerably higher margin of profit by selling petroleum-pitch as bitumen, but why should this advantage be confined to one kind of pitch only? Coal-tar pitch, for instance, is the equal of petroleum-pitch in every way except the smell, and it is not, surely, seriously contended that the smell alone stands in the way of it being called bitumen?

No reply has ever been given to the question why all residues or pitches should not be known as bitumen if petroleum-pitch is to be so described.

The committee appear to have given particular consideration to American practice, although the home of the asphalt trade is on the Continent, and nowhere are the terms bitumen, asphalt, asphaltum, &c., more loosely handled than in America, where the committee look for guidance.

It is, however, in the hands of the engineers themselves to decide whether they follow the American method of calling petroleum-pitch bitumen, or take their stand with Continental and English authorities, who tell us that bitumen is a product of Nature.

I am of the opinion that it is possible to prove to the satisfaction of the legal authorities that the last-named material is what has all along been generally recognised in this country as bitumen, and as this practice will to my knowledge be continued by many, the proposed new title therefore to an old-established trade material can only lead to a considerable amount of confusion.—Yours, &c.,

A. E. H. Dusser.

Institution of Municipal and County Engineers.

ANNUAL GENERAL MEETING AT BLACKPOOL.—(2.)

The telegraphic account of the annual meeting of the Institution of Municipal and County Engineers at Blackpool which appeared in our issue of Friday last covered the proceedings at that gathering down to the adjournment for luncheon on the opening day. The discussion of papers commenced in the afternoon, but at the close of the sitting only three of the six contributions which it had been arranged to take had been disposed of. At the second and concluding sitting on the following morning a further six papers were to have been discussed, but again time did not permit of the agenda being adhered to, only the first two papers on the list being dealt with. Thus, of the twelve which had been prepared, seven—to the keen disappointment of the authors—remained undiscussed. Thursday's sitting was occupied wholly with town planning questions, the three papers presented being by Professor Abercrombie, F.R.I.B.A., Messrs. H. Shawcross and H. R. Aldridge, and W. Ross Young. Some extracts from these contributions will be found elsewhere in this issue. The following is a list of those present at the meeting:—Members: Messrs. J. S. Brodie (president) in the chair, J. E. Aldersley (Earby), S. C. Baggott (Macclesfield), L. L. Baldwin (Coalville), W. E. Beacham (Leek), P. A. Benn (Lichfield), R. H. Bicknell (Westminster), J. Birch (East Ham), H. Bottomley (Bingley), H. L. Bottomley (Hebden Bridge), J. Bowen (Reading), O. A. Bridges (Bognor), J. A. Brodie (Liverpool), C. Brownridge (Birkenhead), J. Bryce (Glasgow), J. A. Budge (Birmingham), T. Bull (Thurnscoe), S. E. Burgess (Middlesbrough), T. Burrows (Lathom and Burscough), R. Burslam (Congleton), A. Burton (Stoke-on-Trent), A. H. Campbell (Edinburgh), W. Louis Carr (Ruislip-Northwood), H. T. Chapman (Kent County Council), F. T. Clayton (Reigate), W. A. Clegg (Dorking), T. P. Collinge (Rotherham), A. E. Collins (Norwich), J. Cook (Fylde Water Board), J. B. Cooke (Denton), C. H. Cooper (Wimbledon), A. E. Coupe (Fulwood), S. H. Davies (Wirral), N. F. Dennis (West Hartlepool), P. Dodd (Wandsworth), D. A. Donald (Grangemouth), J. H. Drew (Wath-on-Dearne), D. Edwards (Taunton), W. H. Elce (Bacup), J. Price Evans (Wrexham), W. Finch (Cumberland), W. Fowlds (Keighley), J. K. Frazer (Airdrie), J. Gammage (Dudley), C. F. Gettings (Worcester County Council), S. Gibson (Biddulph), G. Gledhill (Adwick-le-Street), H. Goodfellow (Southport), W. J. Goodwin (Salisbury), A. T. Gooseman (Wigan), A. H. Goudie (Stirling), A. D. Greatorex (West Bromwich), G. Green (Wolverhampton), W. H. Grieves (Sutton), H. F. Gullan (Belfast), W. J. Hadfield (Sheffield), C. W. Hall (Felling-on-Tyne), W. Harpur (Cardiff), Frank Harris (Tonbridge), T. Harrop (Bispham with Norbreck), G. A. Hart (Leeds), G. B. Hartfree (Alton), J. E. Hattersley (Buckingham), T. W. A. Hayward (Battersea), S. S. Haywood (Brighouse), J. A. Heap (Todmorden), J. R. Heath (Swansea), S. J. Hellier (Finchley), O. Helliwell (Manchester), T. Henry (Retford), J. R. Hill (Ipswich), C. E. Hines (Windermere), H. Holmes (Ossett), J. Johnson (Rawtenstall), E. W. Jones (Wrexham), R. R. Jones (Milnrow), W. Matthews Jones (Chester), W. Jones (Colwyn Bay), J. D. Kennedy (Retford), L. Kenyon (Tottington), A. M. Ker (Warrington), G. W. Lacey (Oswestry), G. W. Lawson (St. Annes-on-the-Sea), J. Lobley (Stoke-on-Trent), R. A. MacBrair (Lincoln), L. S. McKenzie (Bristol), F. Mansfield (Abergavenny), L. P. Marshall (Rangoon), E. B. Martin (Salford), Frank Massie (Wakefield), T. H. Maxwell (Fylde), A. J. Metcalfe (Ashbourn), R. Millar (Greenock), G. C. Mitchell (Stockton-on-Tees), T. Moulding (Exeter), T. Nisbet (Glasgow), J. B. Nuttall (Haywood), J. Nuttall (Woodlesford), P. H. Palmer (Hastings), J. Parker (Hereford), James Paton (Plymouth), W. C. Persey (Barrow-in-Furness), F. R. Phipps (Basingstoke), J. S. Pickering (Cheltenham), T. S. Picton (Eccles), W. Plant (Stafford), S. S. Platt (Rochdale), A. E. Prescott (Eastbourne), A. J. Price (Lytham), W. H. Price (Birmingham), J. J. Quirk (Brynmawr), A. Race (Blackburn), W. Ransom (Worcester), C. E. Rivers (Harrogate), O. C. Robson (Willesden), L. Roseveare (South Shields), A. Rothera (Spenborough), T. Salkield (Delhi), W. H. Schofield (Lancashire County Council), Norman Scorgie (Hackney), W. Shackleton (Nelson), H. Shaw (Ilford), E. J. Silcock (Westminster and Leeds), J. S. Sinclair (Widnes), J. F. Smillie (Tynemouth), C. Chambers Smith (London), J. D. Smith (Kirkcudbright County Council), P. C. Smith (Dunfermline), J. Southwart (Rothwell), N. F. Spence (Marlborough), J. P. Spencer (Tynemouth), F. W. Spurr (York), A. P. Statham (Salford), A. Stevenson (Ayr County Council), H. E. Stilgoe (Birmingham), W. Stubbs (Blackpool), J. Sutcliffe (Woolwich), J. E. Swindlehurst (Coventry), T. Thomson (Dundee), J. A. Tonge (Rawmarsh), W. H. Travers (Wallasey), H. Tremelling (Newport), J. P. Wakeford (Wakefield), H. T. Wakelam (Middlesex), A. H. Walker (Loughborough), J. H. Walters (Congleton), A. W. Ward (Shrewsbury), W. Watson (St. Andrews), J. A. Webb (Hendon), J. Scott Weir (Jarrow-on-Tyne), H. G. Whyatt (Grimsby), G. H. Wild (Littleborough), J. W. Wiles (Manchester), F. Wilkinson (Deptford), F. Wilkinson (Prestatyn), M. H. Wilkinson (Leyland), E. Willis (Chiswick), O. E. Winter (Hampstead), R. H. Winterbottom (Irlam), F. J. Wood (East Sussex County Council), P. C. Woodhall (Uttoxeter), F. C. Woodward (Stourbridge), E. Worrall (Stretford), G. E. Wrigley (Banbury), F. Spencer Yates (Waterloo), J. Young (Ayr), W. Ross Young (Lanark County Council, Middle Ward); Visitors: Messrs. P. Abercrombie (Liverpool University), H. R. Aldridge (National Housing and Town Planning Council), O. R. Anstead (East Ham), T. Arnall (Birmingham), F. Bailey (Brynmawr), Alderman R. Bainbridge (Stockton-on-Tees), J. Berry (Kingstown), W. S. Body (Birmingham), J. Broughton (Hightown), W. W. Chapman (Airdrie), G. Davies (Widnes), W. H. S. Dawson (Bradford), Alderman J. C. Dexter (Birmingham), D. Dickinson (Blackpool), J. Eastwood (Sowerby Bridge), E. T. Everton (Birmingham), D. Graham (Glasgow), T. Greenwood (Todmorden), F. H. Grinsham (Atherton), J. D. Harward (Worcester County Council), J. H. Helliwell (Mytholmroyd), H. Hind (Erith), H. Hirst (Spenborough), J. Howard (Worsley), E. W. Rees Jones (Blackpool), H. J. Kilford (Ilkeston), O. J. Kirby (Batley), W. Lawrence (Stockton-on-Tees), E. R. Lightwood (Lytham), S. C. Lloyd (Dudley), S. Lloyd (Bristol), D. Marlor (Heywood), J. F. Meese (Smethwick), T. Merrells (Swansea), W. Muirhead (Liverpool), D. Mullins (Rotherham), W. Nicol (Glasgow), W. F. Pinfold (Prestwich), Marlow Reed (Middlesex County Council), W. A. Riley (Birmingham), W. Roberts (Cardiff), G. M. Robinson (Greenock), A. Spence (Dundee), E. Squire (Belfast), S. Sutcliffe (Mytholmroyd), A. Sutton (Bradford), G. Symon (Blaydon-on-Tyne), H. Thompson (Basingstoke), T. Thompson (Eccles), J. Thornton (Retford), T. Tidswell (Sowerby Bridge), Alderman Timmion (Warrington), H. Trafford (Burscough), H. Walker (Hereford), C. Warren (Exeter), F. P. Williams (Prestatyn), Councillor J. E. Williams (Birmingham), Alderman G. F. Wilson (Ossett).

The first paper to be discussed was that of Prof. Abercrombie, F.R.I.B.A., on

CIVIC STUDY IN CIVIC DESIGN.

Mr. J. A. Brodie (Liverpool) said he thought the institution was to be congratulated upon having a paper which put before the members points which they should very carefully think about. Professor Abercrombie said, and quite truly, that a number of things which he was recommending had been done in a way, and those who had studied this question for a time knew that those things should be done one way or the other. They might differ as to how things should be done. They might think that the people who had been working on these things knew a good deal about the subject, but the matter was so important that every information should be available before dealing with the question of planning. His own view was that they might easily go too fast in connection with town planning. He thought there was quite as much danger from hastily putting forward plans in connection with town planning as from delaying them. He was glad to say they had been dealing with traffic and main lines of communication. The earliest stages, and the most important were those which dealt with main lines of communication, and what

might taught well the skeleton plan of the whole scheme. So far as South Lancashire was concerned, he was not sure that they had done all they ought to have done as regarded the effect that town planning in one authority might have upon the adjoining areas, and he believed the advice given, and the method of dealing with the whole of South Lancashire, if followed and taken up heartily by the surveyors of the different authorities, would do a very great deal of good.

Mr. H. E. Stilgoe (Birmingham) said that in his city they had already completed two schemes which were now Acts of Parliament. They had in hand three schemes which embraced over 20,000 acres, and they commenced their scheme by planning the whole area of 43,000 acres beside the area outside the city. One of their first works was to make their scheme for the great arterial roads, and they also prepared plans to show how those roads should be widened and what other arterial roads and secondary roads should be provided.

Mr. W. H. Matthew Jones (Chester) said he must congratulate Prof. Abercrombie upon this paper, which was extremely interesting. He had not read very far before he found a reference to an old-fashioned market town which was somewhere near where he came from. He was pleased to see that Prof. Abercrombie stated that the outside authorities in the rural area adjoining such a town could not deal with this problem for themselves. This town was practically built up, and it was the outside authorities that would have to deal with the town plan so far as the outside district was concerned. That was his opinion. The borough was bounded by three counties, Cheshire, Denbigh and Flintshire, and those authorities would have to consider how they were to plan for the development into their respective areas. He thought they ought to do that jointly. He held that the county council should lay down through their district the main roads they would like constructed through the district. If this was done the borough could join up the main roads from its own area to the roads which came through the county. It was no use town planning a scheme setting out roads here and there which suited only the town. They had to look beyond the town to see what the effect of the road would be as to through traffic. If they did not do that the county council could come along and knock the whole scheme on the head by refusing to link up the roads in a proper way. If a county council would prepare a scheme showing its roads it would help the borough authorities in preparing their schemes. There was another point in the paper with reference to the congested area in the centre of the town and the narrow streets. It seemed to him that it would be a wrong thing to widen some of the streets in Chester. Those streets contained half-timbered buildings, many hundreds of years old, of historic and archæological interest, and it would be a scandal to remove them. But if on the outskirts of the city the county councils would lay out some broad lines to go upon it would be better for future development. On the outskirts of the city there were none but small authorities, who could not of themselves afford to go in for any scheme of town planning, and therefore it would fall upon the city authorities to prepare a town plan for the outside districts. He did not consider it was quite fair for the borough engineer to have to prepare a scheme for an outside authority. He had quite enough work to do for his own authority, and he got nothing for his work. There should be some legislation to provide that if a borough engineer prepared a scheme for an outside authority the work should be paid for by the authority concerned.

Mr. J. F. Smillie (Tynemouth) said he had read this paper with great interest. Prof. Abercrombie was a counsellor of perfection, but in the early part of his paper he implied a certain narrowness of outlook to those who had been preparing town planning schemes. He said the Town Planning Act seemed to have encouraged a piecemeal treatment of the subject. He was not prepared to argue whether the surveyors of local authorities did take that view or not, but he said frankly that the Town Planning Act prohibited anything but a piecemeal treatment of the subject. The Act specifically stated that it applied to land in course of development, or likely to be used for building purposes. If that did not mean a limitation he did not know what the words meant. Take a case where one attempted to include for the purpose of a wider scheme a large area of land. Six or eight years ago the landowner would not have been averse to the proposal, but to-day he said, "I cannot agree to my land being included in the scheme," because he was faced with the fact that if it was potentially land considered ripe for building he was likely to have a land tax placed upon it. Their scheme covered so many areas; they might propose to include 1,500 or 2,000 acres in the area to be planned, but they could not say that it was likely to be developed for building purposes within a reasonable time. Therefore they were not able to put forward a comprehensive scheme of town planning. The flaw was in the Act of Parliament, and was not the fault of those who prepared schemes. There should have been no limit to the area, and then they would have avoided any question of potential building land in town planning schemes. They might include in schemes land which would never be built upon, but they might exclude land which might tempt the landowner to develop for building purposes. He sympathised with the ideals set forth in the paper, and he should be delighted to follow them. He had been in consultation with the officials of the Local Government Board, and he had been told that without legislation it was no use their putting forward certain areas in a scheme.

Prof. Abercrombie said the only point to reply to was as to the responsible authorities in rural districts. He had omitted that because it seemed to apply to obligatory town planning. The suggestions were in a sense idealistic. He referred to a method of procedure, and pointed out that it was not absolutely the method which the present Act gave them. He should suggest that it might be necessary to have new legislation for this comprehensive treatment.

The meeting next proceeded to the consideration of papers by Messrs. H. Shaweross and H. R. Aldridge on

OBLIGATORY TOWN PLANNING.

Mr. W. Harper (Cardiff) said he was very glad that Mr. Aldridge had said this was a tall order. If they were to discuss all the points in this paper it would take all the time of the conference. There was a good deal that was controversial, and if he did not challenge many of the points in the paper, he hoped it would not be taken for granted that he accepted them. Mr. Aldridge said, taking next the second case—viz., that of the skilled engineer entrusted with the task of establishing a new suburb with 1,000 houses—would he permit his village to grow on by-law lines? Could there be any doubt as to the answer? He would surely welcome with delight the opportunity to create a well-proportioned suburb, and would not dream of permitting the reproduction of the monotony which marks the typical by-law suburb. But when they came to carry out this kind of thing the question arose at once, "What is it going to cost?" That was what the engineer was met with. In the question of houses, he was told that houses must be built of a given size, of so many rooms, and at a cost at which they could be let at a given rent, and no charge fall upon the rates. This had to be done at the sacrifice of artistic features. When an engineer had to carry out a plan on these lines, naturally artistic features had to go by the board. Next, he would like to say a word in reference to poor old Dowlais. Mr. Aldridge had some very caustic remarks to make about the poor old town. When one went on to the Continent with his eyes and nose closed to that which was bad, and came back enthusiastic over the glories of the town planning of Continental cities, one visited the worst places, not with eyes closed to what was there, and there was no need to stop up his nose in this country as he did on the Continent. One said: "How bad! how frightful! how disgraceful!" That was the point. When they went abroad they looked for the good and closed their eyes to what was bad. Let them not only condemn what was bad, but give themselves credit for what had been done to improve things. He presumed Mr. Aldridge was at Dowlais for a few hours. He had known old Dowlais for fifty-seven years, and he had known it intimately for the whole of that time. There had been some good things come out of Dowlais. Some of the very best coal that could be produced; some of the very best steel that could be produced; and, above all, he knew one very good wife and very good mother. When he first went into Dowlais it had no water supply, and in summer-time it was a common thing to see hundreds of

people, mostly women and boys and girls, standing with their buckets at a well or a spring by the roadside. The quality of that water was never tested; they might guess what it was. Those people were accustomed to staying all night waiting their turn to get a drop of water to drink. Dowlais had no sewerage, no drainage, all the filth of the houses was thrown into the street, liquid and solid, and that was the only method they had of watering the streets. Now those things had been changed. There were other things in the old days. There were hundreds of back-to-back houses; there were many of what he called double-decked houses. One house of two storeys backed up against the hill, and for the lower storey no outlet and no outlook but on the one side. There were hundreds of houses with not a single square inch of land belonging to them, except the street in front, and not even a very wide street at that. In addition to that there were hundreds and hundreds of houses which had no water-closet or privy of any description—a very great deal had been done to alter the condition of things in Dowlais. Perfection had not been reached, and could not be reached without clearing the whole place. Every house had now one of the best supplies of water that could be found anywhere; every house was drained, and nearly every house had got its own water-closet. he believed there were a few cases where there was a water-closet for two houses. Dowlais stood at a level of from 700 ft. to 1,100 ft. above sea level. Many parts of its main street were steep, and many of its side streets had gradients of 1 in 5 or 6. Immediately they stepped out of Dowlais they were in some of the finest country in the kingdom. On the one side there was Morlais Castle, free for anyone to wander over; then they had the river Taff Fechan, extending from Pontsarn to Pontstickell, abounding with trout, where the workmen could go at night, after their day's work, and catch their morning's breakfast. Dowlais and Merthyr were the first to tackle epidemic diseases, especially small-pox. Dowlais had one of the first infectious diseases hospitals ever erected in this country, it was over fifty years since they put up that hospital. It was also one of the first places which put up an apparatus to disinfect clothing by the application of heat, although he must admit that in the early days they destroyed about as many clothes as they disinfected. Things had very much improved. Dowlais and Merthyr had one of the best methods of sewage disposal. It was a pioneer in that matter. It was forty-two years ago since he made a civic survey of Dowlais—that was to say, he made a house-to-house survey of Dowlais after an epidemic of small-pox, and he ascertained every house in which there had been an epidemic, and marked on a map every house in which disease had occurred. That was done with a view of ascertaining the cause and the remedies, and the result had been that Dowlais—black as it was—had no more cases of small-pox than other towns. He thought as Dowlais had been painted so black he would like to say a few words about the poor old place. Mr. Aldridge asked the question, "Is it essential that planning shall be made obligatory in rural districts?" He said Yes, because it was in rural districts that the foundation of urban districts was neglected; and if the foundation was neglected, it followed that the structure must be bad. Unfortunately, he knew many places where this had happened. He thought South Wales was very typical of the absolute neglect of rural districts in the first starting of those districts into urban areas, and the neglect had been something fearful, with the result that places were absolutely thrown together, at any kind of level, one house in and another house out, and so forth. Even the main roads had been ruined by the acts of rural councillors, by their neglect to provide for future development. If there had been any foresight they might have arranged for something very different to be done. For that reason he thought it was very essential that planning should be made obligatory in rural districts.

Mr. E. Willis (Chiswick) said that to a large extent he was in sympathy with the principle of compulsory town planning, but he did not think the time had yet come for it. At the same time, it was necessary to have pioneers, and to have these gentlemen with driving force. Mr. Aldridge had said there were engineers with that driving force; a very good example of it was to be found in Mr. Aldridge. If Mr. Aldridge would gather together the members of their county, borough, district and rural councils in the Albert Hall and drive it home to them, they might get nearer to attaining their object. They must be prepared to drive home the importance of town planning on every available occasion. Even Mr. Harpur had admitted the desirability of rural planning. He was quite sure that neither Mr. Harpur nor Mr. Aldridge expected them in rural areas to attempt anything like the town planning they were attempting in the cities. It was a modified scheme, a scheme which would prevent the breach of amenities which already existed in so many towns, and which they wished to avoid for the future. On the other hand, there was set forth the various points which it was suggested local authorities should include in their schemes. He did not agree as to the necessity of having compulsory town planning to attain those objects. He thought they were going to get those powers in future, but he thought many of those objects they would get in a Public Health Amending Act. The 1907 Act did them a great deal of good, but when this war was over he thought the time would come for an amending Act to consolidate the whole of the Public Health Acts which had been put on the Statute Book, and he thought many of these clauses could be put in such an Act.

Mr. H. Gilbert Whyatt (Grimsby) said they usually regarded Mr. Aldridge as visionary, but in this paper he was intensely practical. He did not see as much in the paper to dispute as did Mr. Harpur. He believed that Mr. Aldridge coming among engineers had been made more practical. They were, of course, intensely utilitarian, and they could not do very much with visions. The great difficulty they had was that mentioned on the previous paper by Mr. Brodie, of Liverpool, of the necessity of making haste slowly. Some of them, looking at the districts round their county boroughs, could not tell where the next development was going to take place, or if there was going to be any development in the next thirty years. But there was all the more need for having the schemes for their main roads laid out, and the details left for future consideration with the Local Government Board if they liked. The town planning schemes at present went too far. The scheme might be divided into two parts—first, the main roads, and then a second application to the Local Government Board for the portion of the area then required to be developed. The question was mentioned by Mr. Aldridge as to what was going to happen at the end of the war. They did not know; they could not tell. The Local Government Board might pursue their present cautious policy as to allowing money to be borrowed, even if the Treasury gave their consent. On the other hand, if the present inflated prices were not brought down soon after the war he was sure many local authorities would not persist with any scheme, and so they would have to wait until prices were more reasonable. Mr. Aldridge gave in his paper a very nice list of things in which the powers of local authorities were limited. He had left out, however, one from which he was now suffering. He said: "(6) Local authorities have no power to prevent a house being built upon any spot the owner wished, and may not even insist upon proper access being given to it. The site may be of such a marshy character as to render the maintenance of the proper health of the inhabitants when built almost impossible, but local authorities have no power to prevent this action being taken." He should go on with a No. 7, and say the local authority have no power to prevent the owner building at any level he pleases so long as the floors were the statutory height above the ground on which it was built. The local authority had no power to prevent an owner building a house below the level of the road. In the 1892 Act they had power to prevent him building on land which was likely to be flooded. A house might be built 18 in. or 3 ft. below the level of the road, if it was above the level of the soil. With regard to poor old Dowlais, he thought Mr. Aldridge was going round there to see the worst he could in order to show how bad housing was in this country. They came to Blackpool and saw the glorious front, but if they went into the back streets they might find buildings there of which Mr. Brodie was ashamed. They could find them in every town. He remembered that one of the things he did when a pupil was to prepare a plan of a row of houses—seventy-two houses long. The agent said he would not have a plan with one house at each end and a row of dots between. He

had to prepare a plan 9 ft. long, showing every house. Mr. Shawcross suggested the waiving of unnecessary regulations in building by-laws. He thought Nos. (5) and (6) ought to have some qualification. As to (5), a certain amount of flagging in back yards was absolutely necessary. There should be an area of 70 or 80 sq. ft., or perhaps 120 sq. ft., properly flagged; the rest need not be flagged, but the cottager might make a little garden of it. The other was the excessive height of rooms. That ought to be qualified. He quite admitted if a living-room was 150 ft. in area perhaps a low height was desirable, but if the living-room was only 100 ft. there should be a good height. These two points ought to be qualified.

Alderman MUIRHEAD (Liverpool) remarked that Scotland-road, Liverpool, had been for many years held up as a byword, but he thought anybody who went up Scotland-road any time before the war began found a considerable improvement every time they went there. He was not opposed to town planning in any shape or form; indeed, he claimed to have helped their city engineer in this matter; and it was all very well for Town Planning Associations to talk about the slums in big cities, but his experience of Town Planning Associations up to now was that they did not touch the people who lived in the slums of big cities at all. It was to be hoped they would find some way of dealing with the poorer working population, the men earning 24s., 25s., 26s. and 27s. a week. Those men did not want to pay more than 3s. 6d., 4s. 6d., or 5s. a week rent. The problem was to find houses for that class of people. With all their talk of town planning, they were not getting to the root of the matter. It was no use having town planning to provide houses for clerks or citizens getting £2 or £3 a week. What they wanted was town planning to improve the housing of the very poor, and the health of the children, and he could not see how that was to be done by anybody but the municipalities. All their fine schemes of town planning had, there and everywhere, faded away like smoke when they came to deal with the slums of a big city. It was no use talking about Scotland-road, and places like that, for the town planners had never attempted to do anything for slum dwellers. They had built nice little houses for clerks and people of that sort, for whom private builders could build houses. The provision of wide arterial roads everybody would agree with. They all wanted wide roads. Mr. Brodie and himself were fighting for a very ambitious scheme for a wide road from the docks in Liverpool. On the day that war broke out the chairman of the Finance Committee said to him, "It is no good bringing that forward to-day, for money is in too bad a state." They were all in agreement as to wide roads but the Town Planning Association did not reach the heart of the problem.

Mr. C. W. HALL (Felling-on-Tyne) believed that Mr. Aldridge must have had a vision of his district when he described the industrial villages. A good deal of coal had been taken out of the earth in his district, but they had had no improvement at all commensurate with the amount of money which had been made in the district. In fact, colliery villages were the worst they had in the North. The land was worth anything from 2s. 6d. to 7s. 6d. per yard. He prepared a report and laid it before his council with a plan for improvement, and he was met with this sort of talk—if town planning was of such importance it should be made compulsory, and then they might take it into consideration. That was good evidence in favour of the paper.

Alderman BAINBRIDGE (Stockton) remarked that in a period of unemployment West Hartlepool employed the men who were out of work in the making of good, broad roads. They paid fairly decent wages, and they got something for their money. Stockton did not take up a similar work. They had 600 men out of work and needing relief. The Local Government Board would not allow them to give relief without work, and they advised stone-breaking. The stone cost them 7s. 6d. per ton, and when it was broken they got 1s. 6d. per ton for it; the extra came out of the rates. They learned their lesson. They were preparing a plan for when the men came back from the war, and if necessity arose they would have a plan for work for them, finding two sets of men three days each, and paying them 15s. for the three days' work. With reference to town planning, they had an estate called the Grange estate, and it was one of the best districts he had seen, with some of the best people in this country living in it. There was only one resident in that district of 200 or 300 houses whose garden looked a little bit shabby, and if he was not shamed out he would be pushed out. That district had not cost them anything.

Mr. W. L. CARR (Ruislip-Northwood) said he could not at all agree with Councillor Shawcross as to the question of land units. Members of local authorities and their surveyors might take it from him that his council up to the present time had not in actual practice found very great difficulty in working the land unit in the squares arranged. Mr. Shawcross in his paper had not said in any way really why he could not support it, and he strongly advised all engineers who were going to put down a land unit, until something was found better to work than the Ruislip-Northwood method, to stick to it, because the experience they had had up to the present time was this—that they had been able to work the land unit without any trouble.

(To be continued.)

ANNUAL DINNER.

The annual dinner of the institution was held on Friday evening at the Hotel Metropole, Blackpool, Mr. J. S. Brodie, the president, occupying the chair.

Following the loyal toasts, that of "His Majesty's Imperial Forces" was proposed by Alderman J. Bickerstaffe, J.P. Colonel Charles Brownridge, V.D., in responding, pointed out that the institution had a long list of members in the prime of life who were serving their country at the front, while others of more mature age were doing their bit at home. As a further little indication of their patriotism he might say that the council of the institution, when it was suggested that they should assist in finding work for a certain modern parasitic introduction in the shape of conscientious objectors, declined to do so.

Mr. A. H. CAMPBELL, M.INST.C.E., city engineer of Edinburgh, in proposing "Public Authorities," observed that great and multifarious as had been the duties of those bodies in the past, it was likely that after the war new and greater responsibilities would devolve upon them, and he ventured to assert that when that time came they would not be found wanting.

The toast was responded to by Councillor Marlow Reed, J.P. (Middlesex).

"The Institution of Municipal and County Engineers" was proposed by the Mayor of Blackpool (Councillor R. Holt, J.P.). His Worship remarked that while councillors came and went they found that officials had a way of sticking. There was no doubt that officials were responsible to a very great extent for the welfare of their towns, and people entering a town could form a fairly good idea of the sort of engineer who was in charge of it. In every way there was no doubt the permanent officials had more to do with the progress and making of a town than the councillors. They had had, and had at present, most excellent officers, but none more excellent than their president, Mr. Brodie. In Blackpool they had many amateur engineers who made themselves known when the promenade widening was commenced some years ago, when they said there would not be enough money in Lancashire to do the work, but despite their bewailings, Mr. Brodie went on with his work and completed it as they had seen. In conclusion, his Worship remarked that he had heard conferences such as was being held by the institution at Blackpool that week described as pleasure parties, but his own view was that it was most necessary that such meetings should be held, because they gave them an opportunity of solving most important problems, and in some instances enabled them to save their towns many thousands of pounds, besides developing ideas that it would otherwise be impossible to bring forward.

The President, in responding, observed that among the objects for which the institution existed was the promotion of efficiency among their members, so that they might serve their authorities to the best possible advantage. The institution had contributed largely both to the commissioned and non-commissioned ranks of his Majesty's Forces, but he was able to say that the whole of their 1,800 members had not so far produced a conscientious objector. (Laughter.)

The toast of "The Visitors and Absent Members" was given by Mr. H. F. Gullan, M.INST.C.E., master of works, Belfast, and responded to by Alderman Lloyd, J.P. (Bristol), and Councillor E. Williams, J.P. (Birmingham).

VISITS.

On Friday afternoon a visit was paid by the members of the institution to the adjoining pleasure resort of St. Annes, a cordial welcome being extended by representatives of the local authority. Owing to illness, Mr. J. S. Sawdon, the surveyor to the district council, was, to the general regret, unable to be present to receive the visitors.

ST. ANNES-ON-THE-SEA MUNICIPAL WORKS.

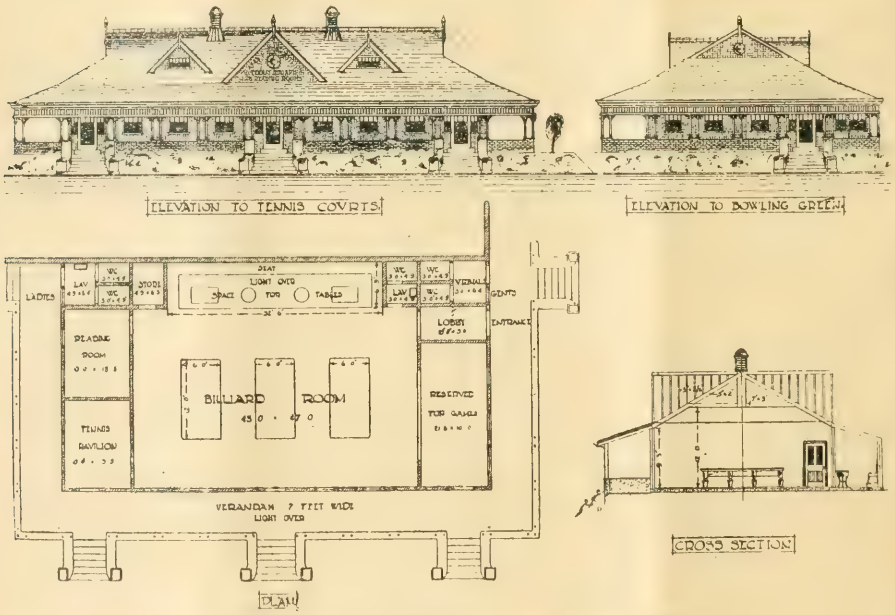
Forty years ago not a single house occupied the site of St. Annes. To-day the value of property in the town is computed at £3,000,000, and the rateable value exceeds £100,000. The population in summer is upwards of 50,000, and in winter about 12,000. The town is situated between Blackpool and Lytham, and is connected with those places by electric tramways. It has been designed on spacious garden city lines. The main street, leading from the railway station to the pier, is 120 ft. in width. There is uniformity in the size of the residences in the various thoroughfares, with a diversity of architecture that is picturesque, imparting an appearance of superiority. St. Annes-on-the-Sea is Lancashire's "Mecca" of golf. There are six courses, with a total membership of over 2,000. The urban council is fully alive to the requirements of an up-to-date town, which possesses admirable public offices, a free library, a technical school, public abattoirs, a fire station, depot buildings, a refuse destructor, open-air sea-water baths, electricity works and ample open spaces. The pier, erected by a company, is claimed to be one of the best equipped marine structures on the west coast.

Ashley Gardens, a beautiful open space of nearly 14½ acres, presented to the town by Lord Ashton, were visited by the members during their stay. The gardens, it may be mentioned, were formally opened on the following day.

When the council in 1914 proposed to purchase this ground at a cost of £26,000, Lord Ashton generously presented the town with a cheque for that amount, and the council were thus enabled to lay out and develop the gardens on a much larger scale than would otherwise have been possible. In the early stages of the scheme a considerable amount of time was taken up in considering the claims of the many tenants in the gardens. A builder's yard, with boiler-house and stables, had to be removed, also a bungalow, a building used as an institute, a large conservatory and greenhouse, and many minor structures. The materials have all been re-used in the several new buildings which have been erected in the gardens, thus producing an economical as well as an efficient scheme. No less a sum than £17,000 has, however, been spent on the works, on which, at one time, 150 men were employed.

Among other objects of interest seen by the visitors were the new open-air baths, an illustrated description of which, prepared by the surveyor, Mr. Sawdon, appears on another page of this issue.

For the following day (Saturday) arrangements had been made for inspections of the garden city at Cleveleys, and of the public works of Fleetwood, Morecambe and Lancaster. When, however, the members assembled in the morning at the town hall rain was falling heavily, and continued practically without cessation throughout the day. As a consequence, until Morecambe was reached, few, if any, of those who formed the party ventured to leave the motor vehicles in which the journey was made. Here, owing to regrettable difficulties which arose in connection with the all-important matter of luncheon—not to mention the weather—there was a general disinclination to go far afield; a considerable number of members, in fact, broke off from the meeting at this point, and, owing to the lateness of the hour, only a comparatively small proportion of those who had started from Blackpool in the morning took part in the concluding visit to Lancaster for the inspection of the new town hall, the Castle, the Williamson Park and Ashton Memorial, and the corporation's mechanical water filtration plant—the last-mentioned of which is described on another page in a paper specially prepared for the occasion by Mr. Arthur G. Bradshaw, F.S.I., the borough and water engineer.



Games Pavilion, Ashton Gardens, St. Annes-on-the-Sea.

ORPHAN FUND: ANNUAL REPORT.

[In their seventeenth annual report to the subscribers the committee entrusted with the management of the Institution Orphan Fund report as under, the period covered by the statement being for the twelve months ended December 31st last.]

The number of subscribers during the year has been 217, from a total of 1,797 members upon the subscribers' list of the institution, whilst twenty-five donations have been received amounting to a sum of £44 12s. 3d., of which £25 11s. 9d. was collected at the various district meetings during the year. The subscriptions amount to £144 12s. 6d., as compared with £133 12s. 6d. in the preceding year, thus showing, notwithstanding the many increased claims incidental

The Surveyor

And Municipal and County Engineer.

to the War, that the number of our generous friends subscribing to the fund has been maintained.

Grants have been made for the benefit of twenty children, enquiries in each families, each case having been carefully investigated beforehand. In addition, one child was enjoying the benefits of a presentation to the Brinsh Orphan Asylum, which expired on May 15th this year.

The amount of grants made is practically the same as during the past five years, and it is with great satisfaction, combined with thankfulness, that your committee are thus able to report, notwithstanding the large number of members of the institution now serving His Majesty in this terrible war. Let us hope that this immunity from increased grants may continue; but your committee would, nevertheless, earnestly request financial assistance being rendered to the fund by a larger number of subscribers than at present. It is satisfactory to report that the kind advocacy of the district secretaries has been continued on behalf of the fund at some of the district meetings, where collections have been made proving of assistance to the fund, but it is hoped that still further efforts will be made in this direction with a view to augmenting the fund, and that collections are made at all district meetings where possible.

The capital invested at the end of the year 1915 amounted to the sum of £1,098 2s. 4d., according to the market value of the various securities on December 31, 1915, the nominal value being £1,463 10s. 10d.

The total income of the fund during the year has been £227 17s. 10d., as compared with £227 8s. 7d. of the preceding year, whilst the administration expenses have been kept down to an extreme minimum as in former years, and the total amount thus expended amounting to £13 14s. 11d. for the year 1915.

The retiring members of the committee, Messrs. J. W. Cockrill, E. J. Elford, E. Purnell Hooley and E. Willis, were duly re-elected for the year.

Your committee regretfully record the death of Mr. W. H. Leete, county surveyor of Bedford, who has been a subscriber to the fund from the early days.

The proposed Ladies' Committee for rendering assistance has, unfortunately, made no further advance towards any practical result. Possibly this may be due to the great amount of philanthropic work now undertaken by so many ladies throughout the country. With the advent of peace it is not unlikely that some more successful result may be obtained in the formation of a Ladies' Working Committee on behalf of the fund.

In conclusion, your committee would earnestly thank all those members who have extended their sympathy and generosity to the fund, and sincerely trust that the work carried out on behalf of the little ones warrants the approval of the subscribers.

A TACTLESS PROCEEDING.

In an editorial under this heading, the *Surrey Comet* of Saturday last deals with a discussion which took place at the last monthly meeting of the Kingston Town Council, at which allegations, for which there was not the slightest foundation, were made against Mr. R. Hampton Clucas, the borough surveyor, and by implication against some member of the town council who was not named.

"The facts," says our contemporary, "were quite simple, and nothing was revealed that was to the discredit of the persons concerned. It seems that one of the principal ratepayers of the borough wished to improve the approach to his business premises and, as the corporation had a large quantity of granite which had been taken off the roads where wood blocks have been laid down, he asked the surveyor to let him have a few loads of the material and the loan of the steam roller to roll it in, offering to pay whatever sum was charged for the material and the work. The surveyor treated the matter purely as a business transaction, furnished the accountant with the details, and the account for the granite and the use of the steam roller was rendered and paid; and there the simple transaction should have ended. But some anonymous individual suggested to Councillor —— that there had been a corrupt transaction, and that credulous councillor proceeded to act upon the assumption, and with almost incredible tactlessness pursued his investigations. The matter was fully thrashed out by the Highway Committee, and every member except Councillor —— was satisfied with the explanation given. But Councillor —— was apparently determined to go the whole length which his folly had dictated, and on Tuesday evening he had the temerity to propose that the salary of the surveyor be reduced by £50 a year. The insincerity of the whole business was shown by the fact that in the end he did not even vote for his own resolution, which was deservedly and ignominiously rejected. The burden of Councillor —— lament was that he was refused access to the books in which the transaction was recorded, but it was shown that this was due to the fact that he would not reveal the name of the person who brought the unfounded charge against the surveyor. Taking the most charitable view of the conduct of Councillor ——, one can only say that he displayed deplorable lack of judgment in listening to such tittle-tattle concerning an officer who has won in an unusual degree the confidence and esteem of the members of the council and the burgesses, and whose honour he ought to have been one of the first to defend."

The Bradford-Shipley-Bingley Town Planning Scheme.—A conference of representatives of the Bradford Corporation and the Shipley, Bingley, and Clayton Urban District Councils was held at the Bradford Town Hall on Tuesday, to consider the suggested town planning scheme involving a large undeveloped area to the west of Bradford within the districts mentioned. The plan is to be called the Bradford, Shipley, Clayton, and Bingley Town Planning Scheme, and it was approved, subject to any slight alterations as to boundaries.

The Alignment Diagram Applied to the Flow of Water in Uniform and Compound Mains.

DISCUSSION OF MR. HALTON THOMSON'S PAPER AT THE INSTITUTION OF WATER ENGINEERS.

The following discussion took place at the recent Summer meeting of the Institution of Water Engineers, following the presentation by Mr. D. Halton Thomson, M.A.(CANTAB.), ASSOC.M.INST.C.E., of a paper entitled "The Alignment Diagram Applied to the Flow of Water in Uniform and Compound Mains." The paper was reproduced in our issue of last week.

Mr. E. J. Silcock said he had great pleasure in proposing a vote of thanks to Mr. Thomson for his paper. It seemed to be an exceedingly ingenious system of calculation, and one which certainly facilitated calculations in connection with the discharging capacity of a network of mains in a most admirable manner. The introduction of the factor of carrying capacity and of obstructive power gave them a method of manipulating these sort of problems which they had no knowledge of before. The only criticism which he had to offer on the diagrams and the system generally was that the nett results of discharging capacity in the examples given did not seem to conform with the results obtained by the formulæ in common use. No doubt that was due to the formula on which the diagram was based. He was not familiar with the particular formula, but, taking Kutter's formula with a coefficient of 0·013, which in his experience gave the most accurate results for the discharge of water mains, and working out the examples (1) and (2) given in the paper it appeared in the example No. 1 there were 4 cub. ft. discharged by the author's diagram. Kutter's formula gave 3·75, which was pretty near. It showed only a difference of about 7 per cent too high. But in example (2) the discharging capacity varied to a much greater extent—viz., to 27 per cent too high. He tried two other examples in order to see how they would compare, taking what might be called normal conditions—viz., a 24-in. pipe with a fall of 5 ft. per mile, and there the discharging capacity was almost identical, only a difference of about 1 per cent. Taking the other example a 3-in. diameter pipe with a loss of head of 20 ft. per mile—in that case the author's diagram gave a discharge of over 50 per cent in excess of Kutter's formula. There must be some reason for this, and it appeared as if the formula on which the diagram was based agreed with Kutter's formula for large pipes, but did not agree for small pipes and for large heads. If he might make a suggestion to the author, he thought he would render them all a great service if he would reconstruct his diagram upon Kutter's formula, because, as he had said before, that gave them most accurate results. It was a very inconvenient formula to work with, and would probably involve him in a good deal of labour; but if he would give them a fresh diagram based on that formula, and would have it put into such a form that they could have it printed on cardboard, so that they could have it to use in a convenient way, he would be doing them a great service.

Mr. C. H. Roberts (Aberdeen) said he would like to add his thanks to those of the last speaker to the author for having put forward what he had rightly described as a comparatively new diagram. He thought a great deal of courage was required to bring forward anything which was at all new, in view of possible criticism. Of course, the alignment diagram had been in use in America and on the Continent for some years, but they had to thank the author for suggesting this new extension of it—the carrying power and the loss of head and the length. He regretted that he had not been able to give a careful study to the paper, but he was sure it would repay very careful study. He could say he had used a modification of the diagram which Prof. Turneaure referred to in his book, and which the author also referred to. Dr. Turneaure's diagram was a four-line diagram. It gave the discharge and the diameter and hydraulic gradient, and another factor, which he believed was velocity—a very useful line in dealing with pumping supplies more particularly in regard to gravitation supplies. Some years ago from the book of Dr. Turneaure he made a little diagram for himself with three lines—discharge, diameter and hydraulic gradient—and using another formula. With regard to the extension of the diagram proposed by the author, he supposed it was submitted for discussion as to its usefulness, and personally he was a little sceptical as to whether it would save much work in calculation. The practice of the water engineer was to use diagrams very largely. He had a little diagram which he dare say was known to most of them. It was a diagram prepared by Prof. Alexander a few years ago, and was a very useful one. It enabled one to deal with the discharge of gallons per hour, the gradient, the velocity, and the size of pipes. As he had said, he had not gone into the paper very carefully, and perhaps if he had done so he might think differently, but he would not be inclined to add more complexity to a diagram than could be avoided; compound pipes could be calculated so conveniently by the trial and error method with the aid of a diagram. There were, for instance, the last two columns; the author had taken them through two examples for uniform pipes in which he used the last two columns, and if they looked at the examples it would be seen that the author got the hydraulic gradient by them. But the hydraulic gradient could be got mentally at once, so that the two last columns were unnecessary for uniform pipes. With regard to the remarks of Mr. Silcock, he agreed in what was said about the use of the formula employed, but he rather joined issue with him as to the correctness of the results. Of course, as the author had explained, the formula which was the basis of the diagram had taken into consideration 30 per cent loss in discharging capacity due to corrosion, and therefore it could not be compared with Kutter's formula with a coefficient of ·013, which applied to new pipes. It was naturally a matter of opinion as to what formula should be used, but he agreed with Mr. Silcock in this respect that it would be desirable for general use to base a diagram on a forumla giving a discharge on *new* pipes, and to allow any reduction of capacity to be allowed for by the engineer using the diagram. That, it seemed to him, was the proper and necessary thing to do. He supposed each of them followed various ways of calculating the particular pipes they had to deal with according to size, number, class of water, and other things; but if a diagram based on a formula such as Kutter's, taking a coefficient of ·013 could be applied, it would be rather useful. There were other formulæ in use in this country, such as the Hagen-Williams, which Prof. Alexander based his diagram on, Hamilton Smith's, and others. There was also the Lawford formula, which was suggested in a paper read before the Institution of Civil Engineers some years ago, and which was referred to in Prof. Goodman's text-book. He put forward these remarks tentatively as to the usefulness of the carrying-power line; there was no doubt that as a mathematical and interesting addition to the diagram the extra three lines would be useful, but from the practical point of view, where they had got to deal with more or less defined factors, it did not appear to him (although he did not wish to discourage the author) worth the extra complexity. In the diagram put forward by Prof. Turneaure, which the author had referred to, there were four columns, and a straight edge put across the diagram ruled off the answer to any problem in uniform pipes directly, and there was no need for the use of a key.

Dr. Herbert Lapworth (Westminster) said he did not think the author of the paper claimed any originality with regard to the alignment diagram because he gave them a bibliography of the method, but what was new was its application to compound mains and networks of mains, and he had followed the author's explanation that afternoon with profound admiration. He thought it most ingenious and clever, and he ventured to think that once it was thoroughly understood it would be of great practical importance. The only point on which possibly one might have a long discussion was the question of choice of formula, and

there he supposed they would all differ as to the proper formula to be used. Some years ago he had to go into the question of the design of pipes in sizes varying from 4 in. to 45 in. diameter, and he secured all the reliable experiments on existing mains that he could. He came to the conclusion in the first place that it was a mistake to cut down the diameter of the mains too small, or, at any rate, not to give a good margin. Another conclusion he came to was that the quality of the water was a factor which had to be taken into account—that was to say, whether one was dealing with hard or with soft water supplies—because it appeared to him, looking at the results of experiments, that the deterioration when dealing with soft or moorland water supplies was much greater than with a hard water supply. Then in the design of a main, should not one consider the period to which one was looking forward? Did one want a main to have the estimated full discharge at the end of fifteen years or thirty years, and should one not design the main accordingly? It seemed to him that was the whole point on which one based one's decision in the design of mains. After a good deal of research he came across a book which was practically unknown, and this was the two volumes of Professor Fidler on "Hydraulic Calculations." Professor Fidler devoted the whole of the second volume to the flow of water in pipes and channels, and derived a general formula of a new type. All previous logarithmic formulæ were similar in the sense that they had three constants, such as in Mr. Thomson's formula were represented by k, m and n. These were never constant by any means, and different mathematicians had derived different values for the same experiments. What Professor Fidler found on studying the matter very carefully was that there was really a definite relation between these three coefficients or indices, and that there was no need to use more than one index, which was actually an index of the roughness of the pipe. There had been numerous books on hydraulics since 1902, and many papers had been written giving new formulæ, but not one of these text books gave a single reference to Fidler's work. He did not think there was anything simpler or more reliable than the work published by Fidler in 1902, and he felt that it deserved recognition. Using the same terms as the author did, Fidler's formula was:

$$i = \frac{1}{1{,}000{,}000}\left(\frac{36{\cdot}84\,q}{d^{\frac{8}{3}}}\right)^{x}$$

or using logarithms $x = \dfrac{\log i + 6}{\log q - \frac{8}{3}\log d + 1{\cdot}566}$

For new pipes: $x = 1{\cdot}76$, and for incrusted pipes, $x = 1{\cdot}95$; the latter giving practically the same results as Unwin's formulæ for incrusted pipes. In regard to hard water supplies, he found that after the mains had been in use for some years, x amounted to 1·85 or 1·90. Taking the author's formulæ for compound pipes, he found the equivalent value of x to lie between 1·80 and 1·85; so that it looked as if it was a little on the fine side, and certainly it gave low results for incrusted mains. But as to this question of hard water, the author was more qualified to speak on it than he was. He would, however, like to know from the author's experience of these chalk waters what index he got, and whether his formulæ was based on his own experience of this class of water. So far as he could make out, the author's formulæ would be applicable to a pipe which had been in use ten or fifteen years with a moorland water supply. It would be very interesting if members who had taken measurements of the discharges of their own mains would see what index they got, and contribute that information to the discussion, because the diagram with the paper really depended on the author's formulæ as to its direct use.

Mr. C. Clemesha Smith (Wakefield) thanked the author for the way in which he had presented the matter and for the very lucid explanation he had given. It had helped him to see many new points which he could not gather from one reading of the paper. But there was one point they wanted to be careful about, and that was the risk involved in assuming values for the internal roughness of cast-iron pipes which had been some time in use, and especially those which had been used for the passage of soft water. He had got nothing but discordant results from calculations he had made dealing with the carrying capacity of old pipes, and had he been dependent solely on calculations and assumed the value of the roughness of the pipe he would at times have gone hopelessly astray. So far as he could see ordinary experience showed that when they were dealing with cast-iron pipes which had been laid twenty, thirty, forty or sixty years they could only get the delivery of the pipe by actual experiment and not by calculation. He had a rather curious case some time ago when he had to deal with a network of pipes about seven miles in length. The system consisted of the following sections in series: (1) An 18-in. main, 1 mile in length, twenty-six years old. This main was partly used as a distributing main in the town and partly as a trunk main carrying water to districts beyond the town. For present purposes we are concerned only with its value as a trunk main. (2) Two parallel mains connected to the end of the 18-in. main, 15-in. main, ¾-mile in length, fifty years old; 12-in. main, ¾-mile in length, seventy-four years old. (3) A 15-in. main, 30 yds. in length, twenty-six years old. (4) Two parallel mains connected to the end of the 15-in. main, 12-in. main, ¾-mile in length, fifty years old; 10-in. main ¾-mile in length, seventy-four years old. (5) An 18-in. main, 3 miles in length, twenty-two years old. (6) A 15-in. main, 1¼ miles in length, twenty-two years old. At eleven points on sections 2, 3, 4, 5 and 6, bulk supplies were drawn and all were metered. The problem to be solved was what would be the increase in pressure at the end of the system if an additional main of given diameter were to be laid from end to end parallel to the existing pipes. The eleven metered supplies were read simultaneously for 12 hours at intervals of five minutes. From these readings diagrams were prepared showing the fluctuations in the delivery of each section. Recording pressure gauges (tested before use against a mercury column) were fixed at the beginning and end of the system and at various changes in diameter. This experiment was repeated several times, and from the information thus obtained the effective diameters of the different lengths were calculated. The effective diameters of the system being known, it was a simple matter to calculate the effect of laying auxiliary mains of different diameters. A new 18-in. main was laid from end to end and the minimum pressure at the extreme end of the system was found to be within 3 lb. of that calculated. The crux of the whole matter lay in ascertaining what was the actual delivery. Some of the older pipes did not appear to have been incrusted any more than those which had been laid thirty or forty years later. In the case of soft water there appeared to be a period when they got a maximum amount of incrustation, and somehow or another they could never tell when the incrustation was going to stop growing. It depended upon several factors—the material of which the pipe was made, the quality of the water and the velocity at which it passed through. It is impossible to estimate accurately the coefficient of roughness of a pipe which had been carrying a soft water for a considerable time. On the whole he considered that if the alignment diagram had been based on calculations for new internally coated cast-iron pipes it would have been of greater value.

Mr. Binnie asked Mr. Smith how much the carrying capacity had fallen off in the older pipes. Could he say what was the percentage of falling off?

Mr. Clemesha Smith said that, speaking from memory, he believed where they were laid together in parallel, a 12-in. pipe seventy years old and a 15-in. pipe of fifty years, the two together were equal to something like a 15-in. new pipe. He could not give them separately as the two were not taken separately.

Mr. J. S. Pickering (Cheltenham) said it appeared to him that the line p on the diagram, which represented the total frictional resistance of the mains under consideration, was much too short to make the diagram as a whole of any practical value. The line was divided to six places of decimals, and it was obviously quite impossible to read such minute divisions with accuracy, and any inaccuracy would affect the results appreciably. The line could not be lengthened without making the diagram of an unworkable size, and he would therefore like to ask the author whether this did not vitiate the use of the diagram altogether.

Mr. W. J. E. Binnie (Westminster) said he did not know whether he would be in order in making any remarks on the subject of corrosion. He lately had been having some experiments carried out for determining the effect of the rate of flow in pipes in corrosion, because he had to put in a steel pipe, and was anxious to see what effect the rate of flow had on the corrosion of steel, which was a more important

smaller than 3 in. the use of cast iron. The results obtained were very erratic indeed. With a still water in the pipe one got a certain corrosion. When the velocity was at the rate of about 1 in. per minute, one got a very much higher rate of corrosion—four times the amount of corrosion in still water, and nearly double the rate of corrosion occurred when the flow got up to a velocity of 4 ft. per second. That was to say, the maximum rate of corrosion was with a very slow flow. The results confirmed the experiments which had been carried out by two German chemists. The experiments carried on at Ilmenau were carried out by Dr. Blount, who had not before him the results of those German experiments, which confirmed them exactly as to the effect of the rate of flow. When the flow was *nil* there was minimum corrosion; when it was slow it was at its maximum.

Mr. A. B. E. BLACKBURN (Sunderland) considered the paper a very valuable addition to their "Proceedings." In reading it through he was a little puzzled at first as to what "*s*" meant, but the author had now made it clear. He defined it as the obstructive power, but did not mention the word in the paper. There had been some discussion with regard to corrosion, but he would like to know whether those taking part in it referred actually to corrosion or to incrustation, because they were two different things.

Mr. BINNIE said he was referring to corrosion, but corrosion was accompanied with incrustation in the case of steel.

Mr. CLEMESHA SMITH: In my case it was almost entirely incrustation. I thought I used that word.

Mr. BLACKBURN thought it would be better if the word incrustation were used where incrustation was actually meant. The author in reading his paper also summed up with one or two rules which he suggested should always be borne in mind. It would be useful to have these rules included in the body of the paper.

Mr. D. HARDEN THOMSON, in reply thanked the members for the manner in which they had received the paper. They would understand that the only points as to which he claimed anything new was the introduction of the carrying-power scale and its use in calculating the loss in compound mains. The rest of the diagram had been published not in identical form, but in similar form, in more than one publication. There had been considerable discussion as to the types of water to which the diagram immediately applied. When he first calculated the diagram he naturally adapted it to the kind of water with which he had to deal—that was a hard, chalk water. Later on, when he commenced to write the paper he did consider whether it should be redrawn so as to suit other types of water; he came to the conclusion, however, that as members had to deal with so many different kinds of water it would be hopeless to attempt a diagram which would comply with all their individual experiences; he therefore decided to leave it in its original form. He was surprised to hear Mr. Silcock say he used Kutter's formula, because modern experiments showed that although that very complicated formula agreed very well with the flow in large pipes, yet in the case of small pipes it was most unreliable. Of course, he (Mr. Silcock) might have had to deal with some class of water to which it by chance applied. Personally he preferred to express all flow by some kind of logarithmic formula which could be made to apply to a great variety of conditions. He was very interested to see the formula of Professor Fidler mentioned by Dr. Lapworth. He had not heard of it before, and there was no doubt that a formula of that kind could be drawn on the alignment system. In order to apply this system the formula used must be of the logarithmic form; it would be impossible to draw an alignment diagram for Kutter's formula suitable to calculate the flow in compound mains. There was no reason why a scale for velocity should not be introduced, but as it was not essential to calculating the flow in compound mains, and with the idea of keeping the diagram as simple as possible, that scale was omitted. One speaker asked whether it would not be better to omit the loss of head and length scales. Of course, for calculations which applied to single uniform mains these scales were not necessary since the calculation of the hydraulic gradient from the loss of head and length of mains was so simple, but when they came to deal with compound mains the loss of head and length were connected separately with the other scales. They saw from the key diagram they had that it was necessary to combine head with discharge and the length with diameter.

Mr. ROBERTS said he meant to refer to the loss of carrying-power line for calculating compound pipes.

Mr. THOMSON, continuing, said he regretted not having introduced the term "obstructive power" for the *s*-scale into the paper as printed. As a matter of fact, it was an afterthought, and when the expression occurred to him it was too late to make an alteration. He was glad, however, to note that now he had interpolated the term when reading the paper, it made the meaning of the *s*-scale very much clearer, and gave a mental picture as to what that scale measured. The last speaker asked whether, owing to the very large range covered by the *s*- and *p*-scales, the diagram was really of any practical use. He thought he could make the point clear by saying that the carrying-power axis and scale were only the means of connecting various values on other scales across the diagram. The actual reading on that scale was not of importance. They would notice in all calculations where the *p*-axis was used it was only a means of fixing the direction of the index-line; it was necessary merely to read the scale as accurately as possible by eye. The more accurately that was done the more accurate was the direction of the index-line.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

LOANS SANCTIONED.

Erith U.D.C. £1,233 for works of sewerage.

Stoke-on-Trent T.C. £12,000 for electricity plant.

Upton-upon-Severn R.D.C. £1,511 in connection with the Kempsey sewerage scheme.

LOANS REFUSED.

Prestatyn U.D.C. £30,000 for a sewerage scheme.

Southgate U.D.C.—£650 for the purchase of a steam roller.

FORTHCOMING INQUIRIES.

JULY.	£
11.—**Aylesbury.** For the electricity undertaking (Mr. A. G. Drury)	
12. **Chatham.** For sewerage and sewage disposal works (Mr. A. G. Drury)	

Women as Cemetery Workers.—At the inspection of the public parks and cemeteries of Greenock last week it was stated that the experiment of employing women in the cemetery had turned out extremely well. There were now nine women working there.

Cornwall Road Surveyors and Military Service.—At the sitting of the Cornwall Appeal Tribunal at Truro on Friday last, the county surveyor, Mr. L. D. Thompson, appeared on behalf of the Cornwall County Council in support of the appeal of Mr. George Palmer, district county surveyor, against the decision of the Redruth Tribunal to grant no further extension of exemption. It was contended that Mr. Palmer had special qualifications, and had charge of 180 miles of main roads, on which there was an annual expenditure of £22,000. The maintenance of the main roads was a matter of great national importance, and he could not be replaced at present without detriment to the national interest. Mr. Thompson said that in other counties district surveyors had been granted total exemptions, and so had many surveyors of rural councils in this county. He could not say that any actual steps had been taken to find a substitute, but that did not mean that the question had not been considered. The military representative said he did not object to three months' exemption, but thought an effort should be made to see if a substitute could be found. Mr. Pearce: Would it not be to the national benefit that the man should remain and look after this length of road? Colonel Williams: I don't think there is much in that. There are a great many road makers. The tribunal decided to grant exemption to September 30th, Colonel Williams remarking that they wished to lay stress on the fact that no effort had been made to find a substitute for Mr. Palmer. The three months would be final. The clerk: The decision is that there can be no application for extension without leave.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor readers with a view to making the information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars have reached us during the present week. Other reports will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Cardiff T.C.—The Property and Markets Committee have offered a site in Cathays Park to the Glamorgan County Council for the county education department at the price of £5,000 an acre.

Essex C.C.—The Education Committee have decided to build a secondary school for boys at Romford to accommodate 200 scholars.

Gateshead T.C.—At the last meeting a letter was read from the Carnegie United Kingdom Trust offering Gateshead £15,000 for a new library building, on the usual conditions, and the Finance Committee will consider and report on the offer.

Guildford R.D.C.—The surveyor, Mr. J. Anstee, reported that the total cost of reconstructing Broadmead Bridge had amounted to £1,709, and of Cartbridge, Hatch, and Round Hole Bridges £1,544, being a saving of £152 and £279 respectively on the estimates.

Newton Abbot R.D.C.—The council have referred the question of the provision of a small-pox hospital to the Joint Isolation Hospital Committee.

Prestatyn U.D.C.—The Local Government Board have written stating that they do not regard the present time as opportune for undertaking the erection of a public abattoir, and are not prepared to entertain an application for sanction to borrow money for the purpose.

Torquay T.C.—The town council on Tuesday passed a resolution welcoming the proposal of the county council to erect a technical school in the borough, and stating that they were prepared to offer a site in the Upton Valley for the building. A resolution was passed instructing the town clerk to take a poll of the borough to obtain the burgesses' instructions whether the pavilion should remain in the hands of the council or whether the building should be let on lease.

HOUSING AND TOWN PLANNING.

Dudley T.C.—The town council on Tuesday adopted a resolution that the Public Works and General Purposes Committee or a special committee should be empowered to take the necessary steps to prepare a town planning scheme. Alderman Cook, proposing the resolution, said the scheme would relate only to those portions of the borough not at present built upon. The borough consisted of 3,500 acres, of which about 1,000 were built upon.

MOTOR TRANSPORT.

Birmingham T.C.—The city council on Tuesday authorised the Lighting, Stables, and Refuse Disposal Committee to purchase, at a cost not exceeding £530, a motor-car for the exclusive use of the stables and veterinary department.

Blackpool T.C.—A motor lorry is to be purchased for the delivery of coke, and a coke-loading machine.

Brighouse T.C.—The purchase of a motor wagon is being considered by the Highways Committee.

Burnley T.C.—The town council have decided to purchase another Leyland petrol tipping-wagon, at a cost of £792, for the cleansing department.

Ilford U.D.C.—It has been decided to purchase a road sweeper at a cost of £673; also a petrol motor chassis and cylindrical tank to hold 800 gallons, at a cost of £900.

Pudsey T.C.—It has been agreed to purchase a petrol motor fire engine.

Southend T.C.—The Economies Committee recommend the town council to extend the use of motor vehicles.

REFUSE COLLECTION AND DISPOSAL.

Southwick U.D.C.—The council have approved a recommendation of the Sanitary Committee to collect house refuse twice weekly during the summer, at an extra cost of 30s. weekly.

Wrexham R.D.C.—Owing to the unsatisfactory nature of the system of refuse removal, the medical officer of health (Dr. T. W. Jones) and the sanitary inspectors have been asked to advise upon a scheme for dealing with the matter.

ROADS AND MATERIALS.

Andover R.D.C.—A scheme has been agreed to for making up the district road at Tidworth, at an estimated cost of £1,361, the greater proportion of which will be paid by the War Office.

Ayr C.C.—At a meeting of the Ayr District Committee of the county council on Tuesday, Mr. Allan Stevenson, the surveyor, stated that his estimate of the expenditure that would be necessary on the district roads during the year ending May 15, 1917, was £10,907, as against £11,266 last year.

Barnstaple T.C.—The town council have accepted the tender of the local gas company for a supply of tar at 2¾d. per gallon. The other tenders were: Exeter Gas Company, 2⅞d. per gallon; Ilfracombe Gas Company, 2⅝d.

Egham U.D.C.—The council have agreed to contribute a sum not exceeding £200 towards the county council scheme for the reconstruction of the Lower Windsor road, near Old Windsor.

Epsom U.D.C.—The surveyor, Mr. E. R. Capon, submitted correspondence with reference to repairing Woodcote-road and South-street, damaged by military traffic, and as the Road Board stated there was no reason why the council should not carry out the necessary reinstatement, although the War Department had not yet agreed to the terms, he was directed to proceed accordingly.

Faversham R.D.C.—Government grants of £200 and £290 have been received in respect of repairs to Harty and Uplees roads.

Holmfirth U.D.C.—The council have resolved to purchase property in Towngate for a widening scheme.

Middlesex C.C.—The tender of Tarmac, Limited, at £1,896, or 5s. 5d. per super. yard, for the resurfacing and the maintenance for three years of the Kingston and Staines main road at Hampton, has been accepted. —The total of the fees received under the Motor-car Act since it came into force in 1904 is £39,958.

Oswestry T.C.—The town council have approved a scheme for widening Whittington-road.

Sleaford R.D.C.—A committee has been appointed to consult with a representative of the Road Board with regard to the repair of the Cranwell road.

Strood R.D.C.—The council have agreed to the Road Board scheme for the repair of the Rochester-Cliffe road.

West Ashford R.D.C.—The Road Board have received the sanction of the War Office to the settlement of the council's claim of £300 towards the cost of the works on the Great Chart-Pluckley road. The total estimated cost is £524.

Wrexham R.D.C.—The council at their last meeting decided to adhere to the original scheme of road improvement and tarring, despite the fact that the Road Board grant to the county council had been reduced from 50 per cent to about 25 per cent.

Wrexham T.C.—It has been agreed to carry out repairs in Mount-street and Salop-road at an estimated cost of £150.

SEWERAGE AND SEWAGE DISPOSAL.

Manchester T.C.—The Rivers Committee are making application to the Treasury for permission to proceed with a part of the main drainage scheme, at an estimated cost of £101,000.

Northampton T.C.—The General Purposes Committee have approved the plan and estimate (£4,650) of the borough engineer, Mr. A. Fidler, for the construction of a sewer and surface-water drains in London-road, and for two surface-water drains in St. Leonard's-road.

Petersfield R.D.C.—The Local Government Board have sanctioned the raising of a sum of £1,200 for the scheme of sewerage disposal for the parish of Liss.

Prestatyn U.D.C.—The Local Government Board

have written approving the proposed sewerage scheme, subject to certain slight alterations, but intimating that a loan for the work could not be sanctioned under existing conditions. The scheme is estimated to cost £30,000.

Trowbridge U.D.C.—The Sewage Disposal Committee reported that the surveyor, Mr. H. Lailey, had submitted plans of proposed lagoons for the treatment of sludge, and after he had explained the proposals and the alternative method of dealing with the sludge by trenching it was resolved that the lagoon method be provisionally approved, the surveyor to submit a more detailed scheme at the next meeting.

Windsor R.D.C.—The Local Government Board have written consenting to the proposed modification in connection with the scheme of sewerage and sewage disposal for Sunninghill and Sunningdale.

WATER, GAS, AND ELECTRICITY.

Belfast T.C.—The gross profit of the gas undertaking for the year amounted to £84,000, and the nett profit to over £62,000, out of which £21,000 will be set apart for relief of rates.

Finchley U.D.C.—It has been decided to provide an overhead cable, at a cost of £75, to supply workmen's dwellings with electricity.

Gloucester T.C.—The ordinary charges for electric current for lighting and power purposes will be increased 20 per cent forthwith.—It has been agreed to increase the street watering of the main roads, and the Streets Committee will consider the question of watering the side streets.

Goole U.D.C.—The report of the gas undertaking for the year ended March 31st last shows a loss of £2,742, which is equal to a rate of 10d. in the £. The loss is accounted for chiefly by reason of a decreased consumption, due to carrying out the lighting restrictions for street lighting and business premises, the increased cost of coal, and the rise in wages of, and war bonuses to, the workmen. There was a profit on the water undertaking of £500.

Kingstown U.D.C.—Negotiations have been completed for a loan of £6,000 to meet the preliminary costs in connection with the electric lighting scheme.

Kirkcaldy T.C.—It has been agreed to increase the price of gas by 4d. per 1,000 cubic feet, making the rate 4s. 9d. per 1,000.

Leek U.D.C.—A new gas engine and dynamo of about 200-kw. is to be purchased for the electricity undertaking.

Lynton U.D.C.—The council received recently a report of a water diviner in reference to a water supply for the isolation hospital, and agreed that the surveyor, Mr. Walter Yeo, should sink a well at the spot indicated.

Nottingham T.C.—The revenue account of the electricity undertaking shows that the sale of current yielded £106,938, and that the expenditure was £69,487, £30,171 being for coals, and £13,909 for rates and taxes. Of the balance of £40,057, £5,000 was contributed to the general district rate, £6,677 was transferred to the reserve fund, and the remainder went in the payment of interest and the repayment of loans.

Paul U.D.C.—Messrs. Douglas, Lewis & Douglas are preparing a report on a proposed water supply for Paul and Newlyn.

Ripon T.C.—A resolution has been adopted to apply for a Provisional Order authorising the town council to provide a supply of electricity.

Spenborough U.D.C.—In connection with the arbitration between the urban council and the Bradford Corporation as to the sum to be paid by the former authority for a supply of water in bulk from the city, the arbitrator, Mr. G. J. Talbot, K.C., has settled the price at 7d. per 1,000 gallons. This sum is intended to represent the cost to the corporation of the water supplied by the corporation to the council, including payments to sinking funds in respect of loans, but without any addition in respect of risk, profit, or otherwise.

Walthamstow U.D.C.—The Finance Committee recommend the council to apply for a loan of £450 for the installation of automatic switches for the public lamps.

West Penwith R.D.C.—The council are negotiating for a site adjoining Withen Well for the proposed reservoir in connection with the Carbis Bay water supply.

MISCELLANEOUS.

Bermondsey B.C.—It was reported that the Horse Committee had paid £97 for a horse. A councillor said the horse was not at all dear, and if the council did not want the animal he would be very pleased to have it.

Spenborough U.D.C.—A committee has been appointed to report upon the provision of fire appliances for Liversedge.

Road Maintenance Unnecessary.—A member of the Lleyn, Carnarvon, Rural District Council, referring to a resolution of the council releasing the roadmen for two months to assist farmers with the harvest, said he thought they should be suspended for twelve months. In war-time road maintenance should be dispensed with, like other things.

FOR OTHER ADVERTISEMENTS
See End of Paper.

COUNTY OF SOUTHAMPTON.

Applications are invited for the temporary appointment of Draughtsman in the County Surveyor's Office, at a salary of £130 per annum.

Applications, stating age and experience, and enclosing copies of not more than three recent testimonials, to be delivered to the County Surveyor, The Castle, Winchester, not later than Monday, the 17th July, 1916. Original testimonials must not be sent, as they will not be returned. (3,038)

BOROUGH OF EALING.

The Town Council of the Borough of Ealing invites Tenders for the Supply of—

1. Household Coal.
2. Coke.

Printed Forms of Tender, Conditions of Contract, and full particulars may be obtained on application to the Borough Surveyor, Mr. W. R. Hicks, ASSOC.M.INST.C.E., at his Office, Town Hall, Ealing, W.

Tenders (in the envelopes provided) to be delivered at the Office of the undersigned not later than 9.30 a.m. on Monday, the 17th July, 1916.

The Council does not bind itself to accept the lowest or any Tender, and any person whose Tender may be accepted must enter into a proper Contract with, if required, two Sureties to be approved by the Council.

The Tenderer whose offer is accepted shall be held to have bound himself to an agreement, and may be compelled to carry out the obligations arising from his Tender, even though he may not have signed a formal Contract.

(By order)
GEO. E. BRYDGES.
Town Clerk.

Town Hall,
Ealing, W.
July 6, 1916. (2,039)

BOROUGH OF EALING.

The Town Council of the Borough of Ealing hereby invites Tenders for the Supply and Delivery of Disinfectants for the six months ending 31st March, 1917.

Printed Forms of Tender, Conditions of Contract, and full particulars may be obtained on application to the Borough Surveyor, Mr. W. R. Hicks, ASSOC.M.INST.C.E., at his Office, Town Hall, Ealing, W.

Tenders (in the envelopes provided) to be delivered at the Office of the undersigned not later than 9.30 a.m. on Monday, the 17th July, 1916.

The Council does not bind itself to accept the lowest or any Tender, and any person whose Tender may be accepted must enter into a proper Contract with, if required, two Sureties to be approved by the Council.

The Tenderer whose offer is accepted shall be held to have bound himself to an agreement, and may be compelled to carry out the obligations arising from his Tender, even though he may not have signed a formal Contract.

(By order)
GEO. E. BRYDGES.
Town Clerk.

Town Hall,
Ealing, W.
July 6, 1916. (2,040)

PERSONAL.

Mr. Norman D. Preston, surveyor to the Mayfield Rural District Council, who sustained a broken arm in an accident recently, is progressing satisfactorily.

Mr. F. P. Delamore, for many years assistant borough surveyor, was on Tuesday appointed borough surveyor of Bournemouth in succession to the late Mr. F. W. Lacey, at a salary of £550.

Mr. J. E. Edgcome, M.I.M.E., M.I.E.E., borough electrical engineer of Kingston-upon-Thames, has been re-elected hon. treasurer of the Incorporated Municipal Electrical Association for the tenth year in succession. Mr. Edgcome is a past-president of the association.

Mr. J. H. Drew, surveyor and waterworks engineer to the Wath-upon-Dearne Urban District Council, whose appointment as borough surveyor of Grantham was reported in this column last week, is not, we are given to understand, an associate of the Institute of Sanitary Engineers, having resigned membership some time ago. In addition to being a member of the Institution of Municipal and County Engineers and of the Royal Sanitary Institute, he is a member of the Institution of Civil Engineers of Ireland.

Mr. Cyril R. Brown, youngest son of Mr. J. A. Brown, of the *Isle of Man Times*, has received the appointment of assistant surveyor to the Mitcham, Surrey, Urban District Council. He served his articles with the borough surveyor of Douglas, and was afterwards appointed assistant surveyor to the Wombwell Urban District Council, where for two years he assisted in the carrying out of various public works. Mr. Cyril R. Brown has passed the examinations and is a student of the Surveyors' Institution, the Institute of Sanitary Engineers, and the Institution of Municipal and County Engineers, while he is also an associate member of the Institution of Municipal Engineers.

Mr. E. W. A. Carter, deputy city surveyor of Gloucester, has been appointed city surveyor and waterworks engineer, in succession to Mr. Richard Read, who resigned recently, after about forty years' service. The services of Mr. Read are to be retained as consulting city surveyor and waterworks engineer, at a salary of £250. Mr. Carter's salary will be £400 a year. The Mayor, in moving Mr. Carter's appointment at the recent meeting of the City Corporation, stated that the feeling of the committee which made the recommendation was that that gentleman possessed the confidence of the council to such an extent that any suggestion as to advertising the vacancy would not be entertained. Mr. Carter had been associated with the corporation for twenty-one years, so that the present occasion might be said to mark his coming of age; and the council had offered him a birthday present which they hoped he would accept. Mr. Carter, in accepting the appointment, said he loved his work, and that would be a sufficient incentive to him to do his best.

OBITUARY.

Mr. John Marshall, surveyor to the Malling (Kent) Rural District Council, died, we regret to state, last week at the age of forty seven. He had been in the service of the council about twenty-one years.

Buxton Incorporation. The Municipal Corporations (Buxton Scheme Confirmation) Bill, which has passed all its stages in the House of Lords, will now proceed to its stages in the House of Commons. The object of the measure is to confirm a scheme by which the urban districts of Buxton and Fairfield, Derbyshire, are granted a charter of incorporation, and will become the borough of Buxton.

The Gas Standard Bill.—The Gas (Standard of Calorific Power) Bill was read a second time in the House of Commons on Tuesday last. In explaining its provisions, Mr. Pretyman said it was a war measure, since its present object was to induce the gas undertakings to increase the production of benzol and toluol. During the war permission to vary the standard would only be given to companies prepared to erect plant for the purpose of producing these war necessities. But it was obviously quite out of date to insist on gas being gauged by its illuminating power, and to take permanent power to permit the change in the standard they were adopting the principle already approved by Parliament in private Bills promoted by gas companies.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Was it not rather an ingenious argument of a resident of Northallerton who had encroached on the public highway by enclosing a small piece of ground, that "every piece of waste ground should be made productive"? Were not the rural district council quite right in deciding "that the highway must be restored to its original condition," for is it not evident that a line must be drawn somewhere with regard to "fancy" lines for effecting economies?

* * * *

Have any steps yet been taken to discover whether the calorific value of house refuse would be increased by first passing it through a "lightning" crusher so as to disintegrate and thoroughly mix it before placing it in the furnace of a destructor? If the calorific value is increased thereby, would the extra expense and power required to effect the necessary pulverulence give such a result as would justify this preliminary treatment?

* * * *

"Is a motor-car a necessity for a surveyor?" is what the Mercantile Association of Newton Abbot, Devonshire, wanted to know in a letter addressed recently to the urban district council of that town. Could not one retaliate by asking if the Mercantile Association of Newton Abbot is a necessity?

* * * *

Was there not a very interesting article, entitled "Ideal Roads," in the *Standard* of the 17th ult.? Did it not give a very good account of Mr. Lovegrove's recent experiments with destructor clinker as a filler for a bituminous base and carpet as a road surface, and is not Mr. Lovegrove to be congratulated on the very excellent results he has obtained with this method of economical construction at an inclusive cost of only 3s. 3d. per square yard? Is it not also a hopeful sign for road engineers that the daily press should find room in their columns for news about road making?

* * * *

Is it not rather interesting to note that the New York State Highway Department cannot get labourers for work on their roads, although there is no war going on as with us? Does it not also point to the high cost of living in this part of the United States when we see that, although the wages are normally 7s. 6d. to 8s. 6d. per day for roadmen, and the Department is now offering more than this, they are still unable to get the men? Is it not a fact that the spending value of a shilling in the States is equal to about 6d., or less, in this country?

* * * *

Why is it that, as a rule, the verdicts in the Courts are usually given against local authorities unless they have a very strong defence against the actions which are so frequently brought against them? Is it because both Judge and jury consider that a public authority should be like Cæsar's wife—above suspicion? Is it because, as a rule, everybody's hand seems to be raised against a local authority, or is it because public bodies are supposed to have a very deep purse?

* * * *

How many of our Universities can follow the example of the California University at Berkley, California, and boast that upon their bookshelves they have, ready for reference, the whole set of bound volumes of The Surveyor since the commencement? Is it not a fact that in these volumes, with the help of the excellent indices in each volume, a student of municipal engineering can find much that will assist him in the study of this complicated and difficult branch of engineering?

Ayrshire Waterworks Extension.—The new rapid gravity filtration plant erected for the Irvine and District Water Board at Greenhead filtering station by the Paterson Engineering Company, Limited, London, to meet the growing needs of the towns of Irvine, Kilwinning, Stevenston, and Saltcoats, as well as Messrs. Nobel's works at Ardeer, was inaugurated last week. The various works recently constructed have cost £60,000, bringing the total capital expenditure to date to £275,000.

Obligatory Town Planning.*

By HENRY R. ALDRIDGE, Secretary National Housing and Town Planning Council.

A little reflection will show that the by-law powers of local authorities are quite inadequate to secure proper control over areas which are in course of development.

For example, in order to make clear how limited the powers possessed by local authorities really are—when town planning schemes are not prepared—the following definite points may be mentioned:

(1) Local authorities have no power to insist that only a certain proportion of a site shall be covered. All that they can insist upon is that each house shall have a certain curtilage space reserved for it at the rear. This space is usually 150 sq. ft.

(2) Local authorities have no power to regulate the height of buildings. An owner may build to any height he likes, provided that he does not interfere with the right of light of his neighbours.

(3) The defining of building lines in streets may be good or bad, just in so far as the ideas of the first owner who builds may be good or bad. Given the establishment of a bad building line by the owner who builds first in a street, the local authority is powerless to protect the amenity of the street.

(4) Except where the provision of cross streets is required under local Acts or by-laws, a local authority has no power to insist on cross streets, and a road may be made of great length without a break if the owners so desire. There is no power to restrict the building of long, unbroken rows of houses. In some cases as many as sixty to eighty houses have been built in monotonous lines without a single break in the line—each house the exact counterpart of the other.

(5) So long as the width of roadway and footway required under the by-laws is provided, local authorities have no power of control over the distance of the set-back of the houses from the footways, and have no power to require the provision of gardens and open spaces to serve as lungs for a district. The provision of open spaces is left to private generosity or is made the subject of heavy payments out of public funds when the land required has become desirable building land with an enhanced value.

(6) Local authorities have no power to prevent a house being built upon any spot the owner wishes, and may not even insist upon proper access being given to it. The site may be of such a marshy character as to render the maintenance of the proper health of the inhabitants of the houses when built almost impossible, but local authorities have no power to prevent this action being taken.

It is thus apparent that in areas for which town planning schemes are not prepared, landowners can lay out their land according to their own ideas, without giving real consideration to the development of land belonging to other owners and quite irrespective of the public convenience. Small builders, who up to now have erected most of the working-class houses, can develop as they like the plots of land they buy provided they observe the provisions of the by-laws. In but few cases, when land is sold, is any provision made for the class of houses to be erected, and a builder can, if he so desires, erect houses of the cheapest character among the best residential property, thus greatly depreciating it. Owing to the same lack of restrictive powers factories can be placed anywhere in a district, and a whole neighbourhood of good houses may be ruined by a factory being erected in their midst.

But there is no need to labour the point. The inadequacy of the by-law method is now admitted on all hands.

USAGE OF TOWN PLANNING POWERS.

It would seem at first sight that Parliament might well allow several more years to elapse before making the preparation of schemes obligatory on all local authorities.

In support of this argument it may be urged that many local authorities have recognised the enormous value of town planning powers and have adopted them willingly. But this argument must be rejected as invalid, since it does not take into account the almost incomprehensible apathy of most local authorities when they have placed in their hands duties of grave national importance.

The vital importance of this apathy and inertness of some local authorities will be made clear by stating a fact to which all must give assent—viz., that under the present permissive system the taking of action under the Act of 1909 bears no relation whatever to the need for such action. The factor is not one of need for action, but of the interest and zeal shown by individual councillors and officers. Where for any reason this factor of interest or zeal is absent, then no town planning action is taken, whatever may be the need for such action. Such a condition of affairs is not only absurd, it is against the public interest.

SKILL IN PLANNING.

Let it be clearly realised that in planning there are no mysteries. It is true that as in the practice of all arts, the difference between the work of the good artist and the bad artist may be very great. But provided that good standards are adopted and provided that wisdom is shown by officers and the local authorities they serve, the danger of bad planning is not very great.

In any case, the task of preparing the obligatory scheme described by Mr. Shawcross later in this report is one which need present no insuperable obstacles to any local authorities.

THE CASE OF RURAL DISTRICTS.

For no other reason than that of saving the country from a large waste of public money, it is essential that the desirability of rural planning should be regarded as within the range of practical politics.

There are no statistics available as to the width of the present main and secondary roads in rural districts, but it is probably a fact that, excluding the great main roads, three-fourths of the secondary roads which have to bear the bulk of the traffic of rural areas, and often serve to connect important towns, are less than 20 ft. in width.

Many public men are of opinion that there will be a great agricultural development in the near future, through the extension of small holdings and of co-operative undertakings, and in many districts much is hoped for from light railways and better and cheaper means of transit. New roads will be required—some of them main roads, the others to relieve traffic on present roads where the distances are too long between towns and villages.

It is estimated that the local authorities of Great Britain have had to pay an aggregate sum of £25,000,000 in the last fifty years as a result of the lack of foresight and power in regard to the proper planning of roads. There can be no doubt that a similar waste of public money will ensue if a great increase in the traffic of rural roads finds local authorities unprepared with proper schemes of development, and if no steps have been taken to secure proper building lines on existing country roads, so that all future buildings on such roads shall be set back at a sufficient distance from the centre of the road to allow future road widening to take place without the removal of costly buildings. It will also be difficult to fix the direction of new roads unless all authorities are compelled to make plans for their districts. A new road will often be required to pass from the area of one authority across that of another, and unless both co-operate in this it will be impossible to fix the position of such a road.

The need for the exercise of care in regard to housing development is equally important. It has been estimated that in order to meet the housing needs of rural districts in England and Wales from 100,000 to 120,000 new cottages are needed, and there can be no doubt that a period of cottage building in rural areas on a large scale is now beginning.

The experience of Ireland in regard to the building of cottages under the Irish Labourers Act is that, whereas at first the cottages were built near to the farms on which the men were employed, the cottages in recent years have been built in village groups. This will doubtless be the experience in this country,

* From a paper presented at the annual meeting of the Institution of Municipal and County Engineers held at Blackpool last week.

and here, as in Ireland, the need for care in grouping will be recognised. To build ugly streets of houses in long rows of an urban type will be to commit a blunder of the worst kind. It will, of course, be necessary to exercise great economy in road construction, but as land is cheap a good set-back can be provided, and an effort will be made to give a pleasing impression to those visiting the villages in which they are built.

In the case of housing schemes carried into effect by local authorities this can be done without any special town planning powers, but apart from the exercise of town planning powers, local authorities have no effective control of the lay-out of areas developed by private enterprise, and for this reason action in regard to planning will be found to be necessary. In such cases the term "town planning" is quite misleading, and some such term as "village planning" should be substituted.

In those villages in which there is no village green or playground it would seem to be highly desirable that as new houses are built, either by private enterprise or by public action, land should be secured for village playgrounds and open spaces. The giving of land for this purpose might well form part of a carefully prepared scheme of rural planning.

PROVISIONS WHICH SHOULD BE MADE OBLIGATORY IN PLANNING SCHEMES.

By H. SHAW CROSS, J.P., Chairman National Housing and Town Planning Council.

The nation will have to rely for planning schemes more on the engineer than on the architect. The planning of the roads will always be the most important practical part of a scheme, and this is essentially the work of the engineer.

But it must not be forgotten that the engineer is apt to look too much in planning roads to easy gradients and shortness of routes between different places. The architect, on the other hand, looks at road-making too much from the point of view of planning the roads in such directions that the accessibility of the different parts of the area for building and development are best secured. He is apt to sacrifice easy gradients and directness of route for the sake of getting the most pleasing effects in vistas and view points, and the danger is that these may be too much considered.

It would seem in the future that if the engineer prepares the plan and if the Local Government Board has a number of experts on their staff, these officials should be able to give the local engineer skilled advice upon his plan. Also the landlord's position in regard to the fixing of the lines for roads must not be overlooked. He will not agree to roads being put in such a position as to damage his land by making part inaccessible, and he may be trusted to look after his own interests.

The professional architect will come in when districts have to be developed and detailed plans prepared for the lay-out of residential districts. In what follows it is assumed that the desirability of making planning schemes obligatory on all authorities is admitted. In the first place it would seem desirable to make the obligatory provisions as few as possible and capable of being carried out in the simplest way. They should be designed to protect the area of the local authority even where no development is going on or is likely to happen in the near future, so that if for any reason, through the opening of a railway, and development of new enterprises (such as mining, or the discovery of minerals, or the presence of a good water supply attracting special works), a district came to be suddenly developed, the provisions of the plan would be there to prevent the overcrowding of people upon the land in the present unsatisfactory manner.

The provisions should also be designed to encourage, and not retard, the building of workmen's houses. Thus, if the small builder comes along wishing to build a few houses, he should be encouraged and allowed to do so without making too many demands upon him—only ensuring that each house has more space, light and air about it than has been insisted on hitherto by by-laws.

To effect this in every case certain points must be settled at once, and every authority would be required to frame provisions relating to these in their scheme.

The preparation of this obligatory scheme should not prevent more detailed and elaborate schemes being adopted later when towns begin to extend into different areas and when industries begin in country districts. It should then be the duty of the local authority to prepare schemes for the more detailed planning of those parts of their districts which are being developed. Such schemes would fix the residential areas, positions for shops, factories, &c., and reserve land for playgrounds, recreation grounds, &c.

It is clear that at the outset it will be necessary to define what is meant by making certain provisions obligatory. If legislation is passed to make it incumbent on all local authorities to prepare schemes within a certain period of time, it will be necessary to give power to the Local Government Board to issue regulations defining those matters which local authorities should be obliged to deal with in their schemes (except in the case of roads). In considering the provisions which should thus be made obligatory, it is of primary importance that the provisions shall be those which are not subject to claims for compensation under the existing Town Planning Act, for it is clear that local authorities will object to be forced to make provisions that would let them in for claims for compensation.

It is therefore suggested that in any fresh legislation that is passed to make it obligatory on all local authorities to prepare planning schemes, each local authority should be required to include provisions in its scheme relating to the following matters:—

(1) The fixing of building lines on all roads.
(2) The fixing of the directions of new roads.
(3) Limitation of buildings to the acre.
(4) Proportion of sites of dwelling-houses to be built upon.
(5) Space about factories, workshops and buildings of exceptional height.
(6) Provisions for varying the width of roads.
(7) Open spaces.
(8) Waiving of unnecessary regulations in building by-laws.
(9) Provisions to secure amenities and to prevent nuisances.

OBLIGATORY PLANNING IN RURAL AREAS.

It would seem that, so far as defining what provisions should be made obligatory in all planning schemes, it is equally necessary that the same matters should be dealt with in rural as in urban schemes.

The difference will be in the details of the scheme, especially in the number of houses to be allowed to the acre—which would be very much fewer in rural than in urban areas.

The question of sewerage and water supply will need to be closely considered in rural areas, for where there is no sewage system, and each house has to deal with its own sewage, ample space should be allowed round the house.

When, in addition, there is no water supply, but water is obtained from wells sunk in the ground for each house, the number of houses would require to be still further reduced to guard against the risk of contamination. If legislation is passed it will probably be necessary to make provision by which rural areas can alter their schemes when sewage systems are installed and public water supplies provided.

It must not, however, be forgotten that many rural districts have parts that are urban in character. What would appear to be wanted are clauses in a scheme by which provisions suitable to urban development can be applied to any part of a rural area by a resolution of the local authority, subject to the consent of landowners and others interested. Also it should be possible at any time to add to the details of a planning scheme without going through all the formalities required now in making a scheme. For instance, if a new road were required it should be sufficient if notices of intention to make same were posted in the district and advertised in the local papers, as is done now in the case of private improvement schemes.

It must also be remembered that, so far as roads are concerned, there is as much necessity for planning rural areas as urban. It would be somewhat farcical if on passing legislation to make planning obligatory it was only imposed on urban areas, for the effect would be that probably the greater number of houses built in rural districts would continue to have four-fifths of the site area of the house covered with buildings, and the same little back yard to each, as is now the case in urban districts.

INSTITUTION OF MUNICIPAL ENGINEERS.

VISIT TO WINDSOR WATERWORKS.

A visit was paid by the Institution of Municipal Engineers on Saturday last to the waterworks of the Windsor Corporation. Some sixty members and friends attended, and among the former were: Messrs. Henry C. Adams, M.INST.C.E., M.I.MECH.E., F.R.SAN.I., the president of the institution, E. A. Stickland, ASSOC. M.INST.C.E., past-president of the institution, and Horace Boot, M.I.E.E., M.I.MECH.E., past-president of the institution. Among the visitors were his Worship the Mayor of Windsor, Mr. W. Carter, J.P., Sir Frederick Dyson, ex-mayor, Alderman Bampfylde, ex-mayor, and Messrs. Walter Dodd, borough accountant, and C. A. Starkie, borough auditor of the Windsor Corporation. The majority of the members assembled at two o'clock on the riverside adjoining the London and South-Western Railway station, where a steam launch was in waiting, and proceeded to the waterworks on Tangier Island. Here the remainder of the party joined up, and the mayor, in a brief speech, welcomed the meeting to Windsor.

An inspection was then made of the pumping plant and of the filters, which latter were put into operation in September, 1915. The filter installation consists of six Candy Patent Declor pressure filters, each 8 ft. 3 in. internal diameter by 18 ft. high, constructed of mild-steel plates to withstand a working pressure of 100 lb. to the square inch. The filters have been laid down by the corporation in order to ensure that the water shall be as excellent bacteriologically as it is chemically and physically. The function of the Declor filters is to destroy any pathogenic bacteria that may accidentally obtain access to the wells, and so to safeguard the health of the borough in this particular direction. The destruction of the pathogenic bacteria is effected by the addition to the water, previous to passing through the filters, of a minute dose of a solution containing free chlorine, and it is estimated that with an ordinary good drinking water the addition of one part of free chlorine to 1,000,000 parts of water will ensure the destruction of the pathogenic bacteria responsible for water-borne disease. Although this exceeding small quantity of free chlorine is quite harmless to human beings, the Candy Declor filters are so constructed that it is eliminated after it has destroyed the objectionable bacteria.

As regards the pumping plant, this lifts the town's water by hydraulic, steam or electric power into the mains, after passing through the filters. A low-pressure turbine is placed in the 12-in. pipe leading to the filters, and is so constructed that its speed of rotation is proportionate to the volume of water passing at any given time. A small ram pump (in duplicate) is worked from a counter shaft driven by the turbine, and this pump is continually injecting into the water passing to the filters a solution of calcium hypochlorite, so that the water here receives its correct dose of free chlorine. The solution of calcium hypochlorite is contained in a small tank, and the ram pump draws direct from this solution tank, which also is in duplicate. After chlorination, the water flows along the filter supply main, and by branches is sub-divided and passes equally into the filters, each of which is arranged for dealing with anything up to a maximum of 8,000 gallons per hour. The installation is capable of treating over 1,000,000 gallons per twenty-four hours. The treated water enters the filters at the top, and, after passing slowly down through them, flows through branch pipes from the bottoms into an outlet main, and thence to the town supply.

All this was clearly explained by Mr. Stickland, who also showed the test for detecting whether the chlorination and dechlorination were being efficiently performed.

On leaving the waterworks, the party proceeded to Boulter's Lock, Maidenhead, where a short halt was called before the return journey. On arrival back at Windsor, before leaving the launch, Mr. Adams proposed, and Mr. Boot seconded, a vote of thanks to Mr and Mrs. Stickland for their hospitality and to the mayor and other members of the Windsor Corporation for the courtesy extended to the members in receiving them. The mayor and Mr. Stickland suitably responded and, finally, Sir Frederick Dyson proposed "The Ladies," to which Mr. E. Whitwell, borough surveyor of Abersychan, responded on behalf of Mrs. Stickland. The day's proceedings, for which Mr. and Mrs. Stickland were responsible, were carried out without a hitch.

COUNCIL MEETING.

At a meeting of the council held in London on June 28th, the following applicants were recommended for admission to membership: Messrs. Mortimer, R., town engineer, Roodeport Municipality; Hesketh, G. W., borough engineer, Estcourt, Natal; Gardner, J. C., consulting civil engineer, Niagara Falls; Ridout, W. W., municipal engineer, Nairobi, East Africa; Padmanabha, S., municipal engineer, Madura, Madras; Chand, Faqir, municipal engineer, Akyab, Burma; Cole, W. S. W., water engineer, Freetown, Sierra Leone; Ericson, R., lighting engineer, Perak State, Malay; Tyers, A. MacK., shire engineer, Bacchus Marsh, Victoria; Dolphin, Geo., surveyor, Uppingham and Gretton Rural District Councils; Pickering, Herbert, surveyor and engineer, Southam Rural District Council; and Nehra, R. K., engineer, Capt. Indian Army, Punjab. To associate-membership: Mr. Platt, F.S., East London Corporation.

Under the by-laws these elections will be ratified at the next council meeting if no written objections are lodged within fourteen days. Elected to Studentship; Mr. Boardman, H. W., borough surveyor's Office, Douglas, Isle of Man. The following applicants, whose names had been duly published, were admitted to membership: Messrs. Griffiths, F. A., city engineer and surveyor, Ipswich, Queensland; Ramsay, Wm., city engineer, Fernie, B.C.; Patel, H. R., superintending engineer, Agra Municipal Waterworks; Bailey, H. S., municipal engineer, Benares; and Matwell, F. E. W., municipal engineer, West Kildonan, Man. To associate membership: Messrs. Gupta, P. C., Resident Engineer's Office, Metropolitan Water Board, Hampton; and Kellett, H., Surveyor's Office, Epsom Urban District Council.

MUTUAL AID DEFENCE FUND.

The draft, "Regulations for Administration of the Fund," as amended by the institution solicitors, were referred to the Special Committee for report.

The next meeting of the council will be held in London on Wednesday, July 26th.

ELECTRICITY CHARGES.

OBJECT OF SUMMER TIME ACT.

In the House of Commons on Monday, the President of the Board of Trade was asked whether, in view of the fact that the Government were appealing to everyone to economise during the war, and that one of the objects of the Summer Time Act was to assist them in doing so, he would introduce legislation limiting the charges of electric lighting companies and local authorities in proportion to the saving of expenditure which they were able to effect during the operation of this Act.

Mr. Harcourt, in reply, pointed out that the chief object of the Summer Time Act was to effect economy in the use of coal by public utility bodies. He was not prepared to introduce legislation in the direction suggested, as any reduction in the charges for electricity might encourage consumers to increase their consumption, and this would involve a corresponding increase in the use of coal by the supplying authorities. Further, the saving to the undertaking on the cost of the fuel economised was probably more than outweighed by the loss of revenue, owing to the reduction in the amount of current supplied.

Asked whether he was aware that the opinion was very generally held that the action of these electric lighting bodies was not only bad form, but very unpatriotic, and ought not to be encouraged by the Board of Trade, Mr. Harcourt said he did not think he ought to express an opinion upon that point.

Cistern and Sewer.—In the course of the Provincial Summer meeting of the Society of Medical Officers of Health, held on Saturday last at Hampton Court, Dr. F. J. Allan, medical officer of health for the City of Westminster and president of the society, mentioned that in a "Guide to London" of 1856, which he had purchased the other day, it was stated that the Thames was "both the cistern and the sewer of the Metropolis."

FUNDAMENTAL AND ECONOMIC CONSIDERATIONS IN RELATION TO TOWN PLANNING.*

By Wm. Ross Young,
Town Planning Engineer, Middle Ward of Lanarkshire.

The initial and perhaps most fatal blunder town planners are apt to make is the concentration of the greater part of their attention on those details and provisions which more properly fall to be considered at a later stage, with a corresponding neglect of those larger and wider issues on which further growth will hinge.

The science of town planning must primarily involve the study of the evolution of towns in relation to social progress and industrial activity, and reducing to some economic basis those governing forces which will determine their future growth, while the plans must be so conceived as to have sufficient elasticity to provide for their rational expansion, notwithstanding the nature, rapidity or direction of communal and economic impulses.

To be successful, town planners must be sufficiently broad in their views to conceive the possibility of new discoveries revolutionising the present industral system, and so changing the modern trend of communal life, just as the discovery of steam power did in the past. For, while the discovery of steam was the predominating factor in localising industries and centralising population, further discoveries and advancement in science may, it is hoped, cheapen power, transport, and travelling facilities to such an extent as to make possible the rapid decentralisation of large populations. In this connection ample provision should be made in the plans and provisions of schemes for the inevitable change to avoid the fatal error of unpreparedness for which so much has been suffered since the industrial evolution of the nineteenth century. Electricity and petrol make for a wider distribution of industries, and Letchworth is an example of possibilities in this direction.

It becomes more and more evident that the town planner's preliminary enquiries cannot rest with investigations concerned only with the growth of any particular or individual area, centre or unit, but must take into consideration its relationship to some main centre. The gradual merging of town groups must be foreseen and ample provision made in advance, and, while town planners must have in view the interposing of wide agricultural belts and open spaces in such a manner as will divide the ever-growing city-like regions into well-organised industrial and communal zones, more or less complete in themselves, the stage when the decentralisation of our industries as a whole lies within the sphere of practical economics has not yet been reached. There can be little doubt that the massing of population into defined centres is likely to continue. True, the density will be kept low and the city growth will be more spread over the land, but the garden city ideal by which the population is to be limited to a definite and preconceived number and where each garden city will be complete and self-supporting in itself, while highly practicable in virgin areas, will not, it is feared, take the place of natural city extension.

City extension directly depends for its creation and existence on the city activities around which it is growing; only in rare instances will it be possible to consider a populous centre or unit so completely isolated from others that its relationship to such need not be considered.

When the garden city movement spreads and new communities are designed so as to be complete and self-supporting, such as Letchworth, a new and entirely different set of factors are introduced; the problem of our city may then become less complex and the hope of regeneration more nearly at hand. The task, however, which town planners are confronted with at present is the laying down or formulation of schemes controlling and directing the lines along which the present cities are to expand and the manner in which whole towns are to be prevented from merging into huge, unhealthy and ill-organised city regions.

The study of city growth as a whole along these lines drives one to the conclusion that areas to be town planned must be sweeping and comprehensive; indeed, if proper results are to be looked for, schemes will often have to embrace the territory of several local authorities, each of which authorities, in the absence of town planning controlling bodies being set up for the larger and more clearly defined districts, will require to work in close harmony with each other and by conferences and otherwise do their best to reconcile their views.

No more fatal error can be made than rushing through sectional schemes unless their proper co-ordination with the many other schemes, which will have to be evolved before the city fringe is disposed of, has been assured and provided for. Any such system is not much better than the one which has hitherto obtained, where each owner made his estate the subject of an independent scheme.

After, and not until, the framework of a large and unified conception of the whole city fringe has been evolved can the sectional plans be started profitably and the consideration of those many details and features for which town planning schemes are to make provision can only rightly be begun.

* From a paper presented at the annual meeting of the Institution of Municipal and County Engineers held at Blackpool last week.

SCOTTISH SANITARY INSPECTORS' CONFERENCE.

PAPERS ON HOUSING AND WATER SUPPLY.

The Sanitary Inspectors' Association of Scotland held its annual conference at Perth recently, under the presidency of Mr. William Wait, chief sanitary inspector of Rutherglen.

Mr. Peter Fyfe, chief sanitary inspector of Glasgow, who gave an address on "The Housing of the Working Classes," advocated the use of concrete blocks for building. He gave the result of experiments as to the amount of carbonic acid gas in typical workmen's houses, and the average of foul air in these houses was 19·2 per 1,000 cub. ft. There was supposed to be a defect in the ventilation of factories where there was 10 in 12,000 cub. ft. In houses where people lived and slept the air ought to be at least as sweet as in a factory. He maintained that houses should be limited to three storeys, tenants should have the use of a bath and a larder for the keeping of perishable goods. It had been possible to build cottages of concrete blocks in England at from 2·8d. to 3·9d. per cub. ft. against a cost of 6d. in Glasgow for shops and houses dressed with cement.

Mr. William Asher, chief sanitary inspector of Perth, who dealt with "Water Supplies," referred to the difficulties encountered at Aberdeen. He suggested that a Central Governing Board should be established on a national basis to deal with vital municipal schemes. He thought the establishment of a Ministry of Public Health was not a Utopian proposal. It would be a bureau where authorities requiring a water supply could get all the chemical, bacteriological and geological information necessary without wasting years and thousands of pounds of money in the process of investigation, and at the same time it would be the body responsible for seeing, among other things, that each community had a sufficient and satisfactory supply for all purposes.

Keighley Trackless Trolley System.—With reference to the Keighley trackless trolley accounts, the report of the Tramways Committee states that, if only the average amount of frosty, hard, cold weather, which it was customary to expect in winter time, had been experienced, the nett financial result would have been very much more satisfactory. The total revenue had been £1,973, on a capital expenditure of £18,134. The amount provided and set aside for sinking fund had been £965, making a total of £1,429 in hand for this purpose. In a concluding general summary the manager observed that "it would appear that there is a prospect that the short distance existing between the Stockbridge terminus and the Bradford tramway terminus at Crossflats will be stepped over in the near future. Such a linking up with Bradford would, in my opinion, have a very beneficial effect on the Keighley tramway undertaking. The amount of goods traffic taken from Keighley to Bradford by road is developing every year, and it seems to be a legitimate field for the tramway undertaking to handle such traffic, and thus reduce the number of private vehicles of all descriptions, which would have a direct saving on the wear and tear of the roads." The Keighley Corporation's trackless trolley system, he went on to say, had been nearly completed during the year, and at the present time the last length was well under way towards completion. The whole of the overhead construction had been carried out at the contract price of £923 per route mile.

The Surveyor

And Municipal and County Engineer.

Vol. L. JULY 14, 1916. No. 1,278.

Minutes of Proceedings.

Obligatory Town Planning.

The paper on "Obligatory Town Planning," presented at the recent annual meeting of the Institution of Municipal and County Engineers by Messrs. Aldridge and Shawcross, was, as every one would expect from these well-known authorities, eminently practical, and though a warning was given by one speaker in the discussion that we ought to go slowly, the general feeling of the meeting was that town planning should be made obligatory. The case for obligatory town planning was presented by Mr. Aldridge, who said that before developing a town plan all the surveyors of the district should be brought together—such as in such a case as that of South Lancashire. From the beginning the surveyors of the local authorities should be consulted, and this was the view of the London authorities. Seven years only had elapsed since the Town Planning Act was passed, and now we were met with the demand to make it obligatory. The town plan should not be a congeries of by-laws streets, but have the widths of its roads and streets varied according to their requirements and importance. The power of local authorities under the by-laws is very limited. They cannot insist on more than a certain small proportion of a building site being left uncovered, and this is usually at the rear, and may be no more than 150 sq. ft. They have no power to regulate the height of buildings, beyond requiring additional strength for the walls as the building gets higher. The building line is fixed by the first builder in a street, and the local authority is powerless to prevent him building up to the footpath if the width of the street is sufficient to provide the open space required by the by-laws for the fronts of houses. No cross streets are required, and a terrace of seventy or eighty houses can be built without a break. No set-back of the house from the footway is required so as to provide a front garden or allow for future widening. The local authority cannot prevent a house being built in the middle of a field if the owner wishes, or compel him to provide proper access to the house. Again, a builder can build cottages, workshops or factories in a good-class residential neighbourhood, and neither the council nor the owners of the neighbouring property can prevent him ruining the district for residential purposes. While many local authorities have shown the greatest interest and energy in town planning, others are apathetic, and some unsympathetic. Mr. Aldridge rightly argues that such a condition of affairs is not only absurd, but against the public interest. Where amenity is most needed to make up for the drabness and hard toil of daily life there is the least care to provide it, while in the better-class residential districts we find they are invariably well catered for in this respect. Though Mr. Aldridge's remarks on Dowlais and the slums in the Scotland-road district in Liverpool called for the protests from Mr. Harpur and Alderman Muirhead, there can be no doubt that, much as these districts have been improved of late years, there is still great room for improvement on sanitary grounds, and especially in the provision of amenities.

The need for obligatory town planning in rural districts is, in Mr. Aldridge's opinion, quite within the range of practical politics. Three-fourths of the secondary roads which run through rural areas are less than 20 ft. wide, and many of these will be required to be widened to relieve the main roads, or for the agricultural development of the district. As it is estimated that a sum of £25,000,000 has been paid by the local authorities of this country as the result of their lack of foresight and power in the proper planning of roads, the necessity for giving rural authorities power to lay out roads on proper lines and of adequate widths is very evident. Mr. Shawcross is of opinion that provision should be made to protect the area of local authorities even where no development is going on, or is likely to happen in the near future. "It is always the unexpected that happens," and the introduction of a new railway, new industries, or the discovery of minerals may cause rapid and unexpected development. Prof. Abercrombie, in his paper, referred to Chester, where large industrial works just outside the city have led to overcrowding in the poorer parts of the city, while the growth of Doncaster and other coal districts is too well known to require further proof of this contention. The preparation of obligatory schemes should be required by the Local Government Board, but the obligatory provisions should be as simple and few as possible, leaving the more detailed and elaborate scheme to be prepared later. These provisions should not be subject to compensation, and no compensation should be given for improvements if they are such as are required by the by-laws. The obligatory provisions should include the fixing of building lines and the direction of new roads, the limitation of buildings per acre, the proportion of sites of dwelling-houses to be built upon, space about factories, workshops, and high buildings, varying the width of roads, open spaces, waiving of unnecessary building by-laws, and securing amenities and the prevention of nuisances. Mr. Shawcross suggests that all roads should have the buildings 60 ft. apart measured from opposite sides of the road, and that each building should be set back 10 ft. from the road; also that land for widening should be given by the land owners. The need for providing a greater proportion of open space on a building site is felt by all surveyors. In schemes already approved one-fourth to one-fifth of the site area of a dwelling-house is allowed to be covered with buildings, but under the by-laws the site of the usual workman's cottage has barely one-fifth of its area unbuilt upon. While there is very little in the

paper with which surveyors will disagree, they will find in it much that is useful and that will call for careful consideration.

* * *

Transport Reform.

Although the correspondence which has appeared in our columns during the past few weeks shows that there is some difference of opinion concerning the merits or practicability of Mr. Gattie's scheme of transport reform, it further shows that the matter is one which has an undoubted interest for municipal engineers. This being so, Mr. Gattie had an excellent opportunity at the recent Blackpool meeting of the Institution of Municipal and County Engineers of explaining the engineering details of his proposed railway clearing-house to an audience of engineers, all of whom are practically interested in problems of transport. Although his lecture was listened to with interest and appreciation, it must be confessed that he did not succeed in making the best use of the opportunity presented to him. It would probably have been better if he had laid less emphasis upon the political aspect of the matter and had confined himself to a description of the engineering details of the scheme. Our readers must by now be familiar with the nature of the proposed reform, which consists in the introduction of goods clearing-houses in all large centres throughout the country. These clearing-houses would be so designed and equipped with such machinery as to facilitate the automatic sorting of goods arriving to them. The initial cost would, of course, be colossal, but so it appears would be the annual saving upon revenue. The figures as stated by Mr. Gattie are truly astonishing. For example, he states that by the adoption of the clearing-house system, terminal work which now accounts for more than 90 per cent of the total cost of railway transport could be carried out in 1 per cent of the time and on 1 per cent of the space now occupied in doing this work. Further gigantic economies would necessarily result in rolling stock, labour, and many other directions. Indeed, it may be said that not only would the whole nation have the advantage which it does not at present possess of quick, cheap, and safe goods transport, but that at the same time the railway companies would earn larger profits for their shareholders, and be able to pay better wages to their employees. That the present system of goods transport is essentially uneconomical is beyond controversy. Broadly speaking, it may be said that a railway goods wagon is in active use for but 3 per cent of its life, the remaining 97 per cent being wasted in detention. Similarly, with regard to locomotives 75 per cent of their energies are consumed in shunting operations. The advantages claimed for the clearing-house are that by an enormous reduction in the time taken in loading and unloading trucks by the container system these trucks would be in active use for a correspondingly larger proportion of their total life, and that by the virtual abolition of shunting the useful life of the locomotive would be similarly increased, and that the risks to life and limb attending this dangerous operation would be eliminated.

Mr. Gattie has apparently had considerable difficulty in interesting the Board of Trade and the railway companies in the success of his scheme. He states that in June, 1914, the German Government, on learning of the idea through the daily Press, at once got into touch with him through the Consul-General in London, while a visit was subsequently paid to the model works by a representative of the Ministry of Transport of Berlin. Whatever opinion any individual may hold as to the merits of the reform proposed, it cannot surely be contended that the idea having been put forward by a man of Mr. Gattie's experience is not at least worth the most serious consideration. It is to be hoped that some at least of the members of the institution will take advantage of the invitation to pay a visit to the works at Battersea and to see for themselves a demonstration of the clearing-house in operation. The thanks of the institution are due to Mr. Gattie for having gone to Blackpool to deliver his interesting lecture.

* * *

London of the Future.

At a recent meeting held under the auspices of that very useful body the London Society, Mr. Arthur Crow delivered a lecture on "The Port of London—Past, Present and Future," in which he discussed the provision to be made on the rather startling assumption that in the year 1975 the population of the Metropolis will have reached the colossal figure of twenty millions. Before the lecturer unfolded his vision of the future, Lord Devonport, who, as chairman of the Port of London Authority, most appropriately presided over the meeting, spoke of the present position of the Port and the work that has been accomplished in connection with the war. He pointed out that when the present dock improvements are completed there will be no less than four miles of new quayage. Moreover, the war has increased the warehousing business of the Port by some 50 per cent. Hundreds of transports have been fitted and loaded; eight hundred million pounds of oats have been transferred from cargo boats and put into bags; two million gallons of rum have been drawn from the vats into jars for use by the troops; while the Port of London has also bulked and packed all the tea consumed by the new armies during their training, and lent their splendid wreck-raising plant for many a ship which has been mined or torpedoed, and which would otherwise have been totally lost.

In looking to the future of the Port, Mr. Crow was strongly of opinion that if the evils of the past are not to be repeated, it is essential that ample and far-sighted provision should be made at once in the matter of arterial roads. Inasmuch, too, as the free and rapid transit of merchandise from docks to manufactory and from manufactory to railway and back again to the docks is a matter of primary importance in regard to our commercial supremacy, the allocation of specific areas for manufacturing premises in close proximity to these main lines of communication is also desirable wherever possible. Indeed, it may be said that the commercial future of the Metropolis depends to no small degree upon the wisdom with which the traffic problem is faced. With an adequate system of arterial roads of sufficient width to allow of the separation of fast and slow traffic, and the provision of space for light railways or electric cars running either singly or connected, there is no reason why much of the warehouse and factory work may not be transferred from the central area into the open country. If this desirable end is to be achieved, however, a well-considered scheme is necessary, and it should provide for ample and unrestricted means of intercommunication between the docks, railways and manufactories, rapid means of transit between the central area and the docks, both for passengers and goods, as well as easy transit between the industrial housing areas and the docks and manufacturing areas. In short, as far as the provision of arterial roads is concerned, the town planning of Greater London must be dealt with as a single problem, although the filling in of the details may well be left to the several local authorities concerned. We entirely agree with Mr. Crow that the present problem of the growing congestion in the central areas is one of serious and immediate concern, and remedial measures must be regarded in the light of Imperial needs.

Public Abattoirs.

Most municipal engineers will agree with the statement made by Mr. H. A. Brown, the engineer and surveyor to the Weston-super-Mare Urban District Council, at the beginning of the paper which he read at Blackpool, that there is probably no branch of municipal work which has a greater influence upon public health and which has hitherto received less attention than the construction of abattoir buildings. Some years ago, as a result of a strong agitation in favour of slaughter-house reform, a Government Commission of Enquiry was appointed. This commission made every possible investigation, consulted all the authorities, and visited a number of abattoirs, both in this country and on the Continent. As a result of their enquiries the commission came to the conclusion that a good deal of cruelty was going on, and that this could be prevented by greater attention being given to the design of the buildings and much suffering obviated by the adoption of improved methods of slaughter. Their report, which was presented in 1904, recommended the adoption of certain principles which are now considered elementary. In the first place, all animals awaiting slaughter should be kept apart from the actual slaughtering, so that they can neither see nor smell what is going on. Again, no animal should be slaughtered until all traces of a former victim have been thoroughly washed away. The broad principle upon which a modern abattoir should be designed so as to comply with these essential conditions is that the buildings should be so arranged that the animals can enter at one end, go through the several processes, and ultimately pass out at the other end without traversing the same block twice or crossing an open roadway.

The matter of abattoir design is certainly one in which this country has been far behind other countries on the Continent of Europe. The reason for this may be that which Mr. Brown suggested —namely, that in England the subject of slaughter-houses is so distasteful to the majority of people that its consideration is shelved to the last possible moment, when it is dealt with in a hurried manner, the slaughter-house being considered as an evil which has to be tolerated. Abroad, on the other hand, the subject is approached from the humanitarian and hygienic standpoints as a definite problem of public health administration. The result is that in many continental towns the abattoir is placed in attractive surroundings, with shrubs, trees, and grass plots introduced wherever possible, all walls being glazed internally, and a complete and elaborate system of meat inspection being established. Mr. Brown's experience in regard to this matter at Weston-super-Mare, together with visits which he has paid to other institutions, enable him to speak with authority on a question the importance of which is certainly far greater than would be supposed from the small amount of attention that it receives.

* * *

Reconstruction in Dublin.

The harm done by the recent unfortunate events in Dublin was not limited to the material damage caused by the actual destruction of property, and a further effect is now being felt in the difficulty of re-establishing trade connections that have been severed. It is true that considerable progress has already been made in clearing the devastated area of wreckage and *débris*, but it is impossible to keep business suspended until a permanent scheme of reconstruction is carried out. In most cases, therefore, temporary premises are being provided in order to facilitate the resumption of business. We gather from a recent issue of our contemporary the *Freeman's Journal* that, as might be expected, there is no desire on the part of the city authorities or of anybody else to delay matters by a single day, and no hindrance whatever is placed in the way of the erection of such emergency structures as tradespeople may deem suited to the exigencies of the moment. Several of these are in process of erection or in contemplation, and it will be a considerable time before permanent premises are generally well advanced. So far it appears that only two firms have lodged complete plans for their new establishments and have started work on that basis. It is surmised that some few others of the more prominent traders affected will follow on the same lines, but for the great majority the wooden structure will have to suffice for the present. In the words of a prominent city official who has to do with the designs, the earlier restoration of the ruined area will be very much like the first start of a pioneer city of the prairie. It is the intention of the corporation to deal with the general question of reconstruction by means of a Bill, and active steps are already being taken towards its preparation. It is interesting to observe that one of its provisions proposes to give the corporation a regulating power over the designs, and an effort will also be made to get controlling powers with regard to the widening of narrow thoroughfares in so far as they were affected by the destruction. As matters stand at present the corporation has really no effective control of the designs. They cannot unreasonably or vexatiously withhold their approval of plans of buildings submitted to them, and in the case of the rebuilding of a ruined street they have no authority in the way of providing for a wider thoroughfare.

National Health in War Time.

Mr. Walter Long, in reviewing the work of the Local Government Board on Tuesday, was able to present quite a satisfactory and favourable, if not a roseate, impression of the hygiene of the country during the past year. There have been many delicate and difficult problems to handle in that period without there being much time to spare for deliberate consideration with respect to details, yet the public health has been maintained at a high standard. Although for a period of two years there have been enormous numbers of men suddenly collected in certain areas, where there was often at first insufficient accommodation, there has been a steady decrease of enteric fever, while "there was no probability of any danger from smallpox." This latter statement argues a high note of official confidence—much too high some might consider—but if, as is probably the case, it has reference to the provision made for the isolation and treatment of possible patients, it reflects satisfactorily the activities of the local authorities in regard to hospital accommodation. The circumstances under which these conditions have been maintained ought not to be overlooked by the public any more than they will be forgotten by the responsible officials, who in conditions of great responsibility have contrived to "carry on" the sanitary work of the nation. The future, as Mr. Long indicates, has much in store for us. There will be need for the immediate consideration and prompt action with respect to housing, public works, and further health provisions. These subjects have been more or less—rather more than less—in a state of suspended animation for some time past owing to financial exigencies, but, according to the statement of the President of the Local Government Board, they are being carefully surveyed by the Reconstruction Committee. Mr. Long was obviously justified in dealing with departmental problems in a spirit of optimism, and it may be added that he did not fail to acknowledge with gratitude the enormous amount of voluntary work that has been so nobly pressed into the service of "mitigating existing evils and anticipating future needs."

My Experience with Fine-Grade Filters.*

By W. H. MAKEPEACE, M.R.SAN.I., Sewage Engineer to the County Borough of Stoke-on-Trent.

There has been, at one time or another, considerable controversy as to the life of a fine-grade filter. In 1912 I brought to the notice of the Association of Managers of Sewage Disposal Works the limits of this type of bed, and, as a further four years have passed, I felt it would be of sufficient interest to record my experiences.

The Royal Commission, in their final report respecting this type of bed, had to fall back on that all-important word "if" in the conclusions they arrived at.

Practically the whole of the 17 acres of filters under my control at present are of the fine-grade type, the upper layers varying in size from $\frac{1}{16}$ in. to $\frac{1}{8}$ in., $\frac{1}{4}$ in. to $\frac{1}{8}$ in., $\frac{3}{16}$ in. to $\frac{3}{8}$ in., and $\frac{3}{8}$ in. to $\frac{5}{8}$ in., the depth in all cases being 12 in. Underneath this is a layer of $\frac{1}{2}$-in. to $\frac{5}{8}$-in. cubes, which form the main body of the filter, and this is supported by $\frac{3}{4}$-in. to $1\frac{1}{4}$-in. cubes as the lower layer of filter media. This in turn is supported on 12 in. of 2-in. cubes overlying the under drains, the average depth being 5 ft.

The rate of distribution per square yard per day at the Hanley and Fenton works is 200 gallons, the upper layer in this case being $\frac{1}{4}$ in. to $\frac{1}{8}$ in. and $\frac{3}{8}$ in. to $\frac{3}{16}$ in. respectively. At the Tunstall and Burslem works the rate is about 175 gallons, with an upper layer of $\frac{3}{8}$ in. to $\frac{5}{8}$ in. and $\frac{3}{16}$ in. to $\frac{3}{8}$ in. respectively. At Longton the rate is 130 gallons, the upper layer in this case being $\frac{1}{8}$ in. to $\frac{1}{16}$ in.

With the exception of Burslem, the tank effluents from the five works maintain a steady figure of 11 to 12 parts per 100,000, about half of this being mineral solids. At Burslem the solids in suspension figure in the tank effluent averages about 15 parts per 100,000.

The method of distribution at Hanley, Fenton and Longton is by means of rectangular power-driven distributors, which are arranged to distribute the sewage on to the beds with an interval of rest of about six minutes. At Burslem and Tunstall the distributors were of the power-driven rotary type, which I have recently converted to automatic rotaries. It is generally admitted that this method of distribution is very good at the former three works, and at Burslem and Tunstall it is also satisfactory.

After twelve years' continuous running of the beds at Hanley works it has not been necessary to renew or wash any portion of the area, and the effluent to-day still remains a good one. No choking has occurred, and the matters in suspension discharged on to the beds does, contrary to expectations, come away regularly and freely with the effluent. For the first seven years there was practically no suspended matter in the filter effluent. At the eighth year it rose to 1·92, with a greater discharge immediately after a bed had been restarted from the resting period. The solid in suspension figure to-day is about 2·5, and this I attribute very largely to the imperfect tank effluent, brought about chiefly by the efforts made to work the plant in the cheapest manner possible.

RECOVERY OF BEDS AFTER REST.

It is very surprising to find how rapidly a bed recovers after a short period of rest. I generally find that after a bed has taken rest, and by raking over the upper layer of the filter, which contains the bulk of the matters remaining on the bed, it has been perfectly free, and will keep on working for a considerable period without signs of surface pooling. I find that the surface pooling does not have any material effect on the effluent, unless it is allowed to go on indefinitely.

A great improvement has been effected in the effluent at the Burslem works, owing to the proper grading of the material and provision of under drains, with, of course, a greatly improved tank effluent. The suspended matter has also come away quite freely, and causes us no difficulty as far as choking of the filter is concerned.

At Longton, where we have the very fine material at the surface, the rate of distribution has had to be reduced to 130 gallons per day, and at this rate considerable pooling takes place after a month or six weeks' continuous working. The size used here as a top layer is, from my experience, too fine, because of the great difficulty of obtaining a material which at this size is hard enough, and which would not easily disintegrate. The effluent, however, here is by far the best in the department, practically no suspended solids passing with the effluent from the bed, with the result that the surface soon becomes waterlogged and a rest is necessary.

A good deal of this difficulty has been overcome by forking into the filtering material a larger size, and to a great extent we have obtained satisfactory results.

For practical use I am satisfied that the material on the Longton beds is too small, because it will not allow any great variation in the rate per yard treated. The most useful size is $\frac{1}{4}$ in. to $\frac{3}{8}$ in. as a top layer, which I have placed on two beds at the Burslem works. These readily take a volume equal to the rate of 200 gallons per square yard per day, and the effluent is a very good one, and the matters in suspension come away very freely from the bed.

When the various works in this department were designed no provisions were made for humus tanks, as at that time it was not thought necessary. I have, however, put down humus tanks at Tunstall with a capacity equal to $2\frac{1}{2}$ hours' flow. This takes practically the whole of the matters in suspension, and the effluent discharged from the tanks is very clear.

LIFE OF FINE-GRADE FILTERS.

Although the Royal Commission in their recommendations consider the life of a fine-grade filter to be about five years, I find that after thirteen years' working it has not been necessary to renew or wash any of the filtering material. In one or two cases, however, the time has arrived when this would be an advantage to the discharging power of the bed, principally at the Longton and Hanley works. The effluent, however, has always been of an exceptionally good character, and, as we are on the banks of very small streams, this is an important matter to us.

One of the chief things to aim at in the successful working of a fine-grade filter is perfect distribution of the sewage. This type of filter will, however, stand a more varied rate of flow than a coarse-grained filter, and maintains the quality of the effluent. This, in my judgment, is due to the rapid splitting up of the sewage discharged on to the bed through the greater number of interstices and smaller area than is the case in a coarse-grained bed. With this type of bed you are able to deal with any trouble arising, as, owing to its size, it is nearly always found on the upper layer, where it can be more readily controlled and, if necessary, removed.

I need hardly remind the members of this association that the most important thing, in order to obtain the greatest efficiency from this type of bed, is to see that the tank effluent is as perfect as possible. In our case this has been readily obtained by simple sedimentation in rectangular tanks, and immediately we find our matters in suspension increasing beyond 12 parts per 100,000, steps are taken to clean out same.

The material used in the filters in the Potteries is called "saggers," a waste product from the pot works which has been fired very hard. It was thought years ago that this would disintegrate very rapidly, but very little disintegration has taken place, and, in view of the size of this material, it has stood the test exceptionally well.

Fine-grade filters work better when the sewage is distributed on to them at intervals, and I find that an interval from three to six minutes gives the most satisfactory results over a continuous and lengthy period. I should prefer to put down fine-grade filters at any place in preference to coarse filters, if it is reasonably possible to obtain a good tank effluent, because the purification is likely to be more thorough; but time has proved that this type of bed will stand much more abuse and last a longer period than was anticipated some years ago.

I certainly am of opinion that, under proper control, fine-grade filters will not become permanently choked; will readily discharge humus after two or three years' working, and will after that period come away regularly, and the character of the humus will lend itself to precipitation as readily, and will be in a more inert condition than the humus from a coarse-grained filter. It is very important, however, to have complete aëration, and the under-drainage of the filter must be as complete as possible.

* Paper read at the Annual Summer Conference of the Association of Managers of Sewage Disposal Works held at Sheffield last Saturday.

The Sewage Problem.

LATEST DEVELOPMENTS AND POSSIBILITIES OF THE FUTURE.*

By Dr. SIDNEY BARWISE, B.SC., County Medical Officer of Health, Derbyshire.

We English are a slow thinking people. It has taken this terrible war, in which everything which makes life worth living is at stake, to drive into our stupid heads the obvious truth that national security should come before the pursuit of wealth. So it took the epidemic of cholera in 1831 to bring home to our people the necessity for providing themselves with a proper system of sewers. In 1843 a Royal Commission on sanitary conditions of towns led to the passing of the Towns Improvement Clauses Act of 1847, and the Public Health Act of 1848, under which a general board of health as a central authority obtained power to set up local boards of health. I am old enough to remember seeing the water-carts going along streets in a suburb of Birmingham bearing the title "Local Board of Health." The designation was a good one, but the principle under which they were appointed was Gilbertian, for it was the districts in which sanitation was neglected which could set up these local boards—not the progressive districts, but the districts with a death rate higher than 23 per 1,000.

As the result of the Sanitary Commission sitting from 1869 to 1871, the Local Government Board was set up, and the Public Health Act, the sheet-anchor of sanitary administration of this country, was passed by Lord Beaconsfield in 1875.

As far as the question of sewage disposal is concerned, the first commission was appointed in 1857, and they reported in 1865. The commission was called into existence as the result of the sewering of towns carried out as preventive work against cholera under the Acts of Parliament already mentioned. In 1868 another commission was appointed, which made several reports, the last being 1874. Up to this time the treatment of sewage consisted of three processes—chemical precipitation, broad irrigation, and intermittent land filtration. The commission reported that all these processes might be relied upon to remove matters in suspension, but that the best results were obtained by intermittent filtration.

Another commission was appointed in 1882 to report on the system under which the sewage of London was discharged into the Thames, and what measures should be applied for remedying any nuisance if such was found. In 1884 they reported that evils did exist which demanded prompt remedy, and that by chemical precipitation the liquid might be sufficiently free from noxious matters to be discharged at the present outfalls, but not permanently.

The Local Government Board have made it their practice to be bound by the findings of the various commissions. In practice it has had an unfortunate result. As far as the purification of sewage is concerned it is not any advantage to an authority to produce a good effluent—it is the local authorities lower down the stream who obtain the benefit of a good effluent or who suffer inconvenience if the effluent is bad; so that until the Local Government Act of 1888 was passed, bringing rivers boards and county councils into existence, local authorities had not the incentive of "self-interest" to produce the best effluents, and in consequence carried out the schemes which cost least.

FAILURES.

The system of throwing sewage disposal schemes open to competition has resulted in a certain type of engineer studying the paper requirements of the Local Government Board, based on the recommendations of various Royal Commissions, so as to put a scheme before the local authority with the sole object of obtaining the sanction of the Local Government Board to it. The result was that twenty-five years ago, it is no exaggeration to say, nine-tenths of the sewage schemes in the country were failures. Broad irrigation schemes had been adopted where the land was quite unsuitable, and, worse than this, stiff clay land was sanctioned for intermittent filtration, provided it was lightened by engine ashes.

I was appointed to take charge of the public health department of the County of Derbyshire in 1891. At that time the only method of sewage disposal in the county, except at Long Eaton and Buxton, was by land irrigation. In the two places mentioned there were precipitation schemes, and, needless to say, the effluents were unsatisfactory. As most of the land in the county is stiff clay, as a first step I advocated tank treatment and precipitation in addition to broad irrigation, and works on these lines were carried out at Alfreton, Chesterfield, Ilkeston, Heanor, Chapel-en-le-Frith, New Mills, and Burton-on-Trent. The result, although a great improvement, was not altogether satisfactory.

In the early 'nineties schemes of precipitation and artificial filtration through filters composed of materials the size of peas, covered with a layer of sand, were adopted, and gave good results, but required constant attention. I refer to what was known at the time as the International Sewage Company's process. These schemes proved that sewage could be purified without large areas of land.

About the same time Mr. Dibdin elaborated his contact-bed process, and an acre of experimental contact bed was put down. Following on this, Mr. Cameron, of Exeter, called attention to the part played by bacteria splitting up organic matter in what he called a septic tank. The greatest credit is due to him for his imaginative touch in calling a tank a "septic tank," because it riveted attention on the function of bacteria in the purification of sewage.

In 1897 I prepared a *résumé* of principles involved in the purification of sewage, in which I laid down that, as far as Derbyshire was concerned—

(1) The land would purify by broad irrigation the sewage of from 25 to 100 persons to the acre.

(2) If precipitation was also adopted it would purify the sewage of some 200 to 400 persons to the acre.

(3) That on limited areas of suitable soil the sewage of some 500 to 600 persons to the acre could be purified provided the sewage underwent preliminary chemical precipitation.

(4) That the sewage of some 2,000 persons could be purified by chemical precipitation and subsequent filtration through specially prepared filters of coal, coke, polarite, burnt ballast, &c.

I then stated what was subsequently found by the Royal Commission—that an artificial process was advisable, except where sandy or fine, gravelly land could be obtained at about £100 per acre.

The first sewage filters were covered with sand, which was a constant source of trouble.

The next step forward was the elimination of this layer of sand, the sewage being sprayed over the filters through fixed perforated pipes. To get a sufficient spray over the surface of the filter a considerable head was required. To make the application of the tank effluent intermittent, various mechanical devices were adopted—tippers, automatic valves actuated by floats, and automatic syphons. Continuous drip filters were also brought out, such as Stoddart's and Colonel Duckett's.

In the same year (1898) the Royal Commission on Sewage Disposal was appointed, and in 1901 they issued an interim report in which it was admitted that it was practicable by artificial processes to produce stable effluents which might be discharged into any stream. The point I wish to make is that local authorities were in advance of the central authorities.

Following on the interim report of the Royal Commission, the question which first excited public attention was the relative advantages of percolating filters and contact beds. In the same year as the Royal Commission's interim report I published a small work on the bacterial purification of sewage, in which I summarised the relative advantages and disadvantages of filters and contact beds, and summed up in favour of filters. The main advantage of contact beds was that no distributor was necessary. I pointed out that to obtain good results from filters the material must be quite free from dust, and the particles should be from $\frac{1}{4}$ in. to $\frac{3}{4}$ in. in size. In the same report I pointed out the advantage of revolving arms over fixed distributors. In Derbyshire we have not found it necessary to adopt any patented revolving arms.

Since the final report of the Royal Commission was

* Presidential address delivered at the Annual Summer Conference of the Association of Managers of Sewage Disposal Works held at Sheffield on Saturday last.

published a most striking development has taken place in the nitrification of sewage without filters.

One of the fixed ideas that everyone had who has touched the problem of sewage purification is that Sir Edward Frankland had proved that sewage could not be purified by direct aëration; that no river in England was long enough to purify the sewage that flowed into it; and hundreds of men must have experimented on sewage by blowing air through it. It remained for Dr. Fowler and Messrs. Ardern and Lockett, and at Salford, Mr. Melling, and Messrs. Martin and Duckworth on a practical scale to prove that sewage could be nitrified by activated sludge and aëration. The part played by bacteria and infusoria was never dreamed of at the time Sir Edward Frankland made his experiments. There may be many changes, such as physical, chemical and electrical, taking place to-day which we do not appreciate, and we must guard against taking an unscientific and dogmatic attitude.

The practicability depends upon the cost. On this account, where there is sufficient fall for the oxidising process to take place on artificial filters without pumping, the activated sludge process, involving as it does practically the cost of pumping, is out of court.

When pumping is necessary, whether the activated sludge process will become a practical proposition or not depends upon the ability of the engineer to get over mechanical difficulties.

The first Salford experiments never professed to be a final exposition on this point, but a demonstration that sewage could be pumped by aëration by means of activated sludge, both in fill and draw tanks. In these experiments the air is blown in through nozzles, and it is obvious that the great bulk of the air blown through the sludge and sewage is not used up. To get over this difficulty Messrs. Jones and Attwood brought out their diffusers of cast-iron boxes with porous tile covers. These diffusers have this advantage over nozzles, that the air is blown out in the form of small bubbles.

There are two desiderata required for the process:—

(1) Aëration.

(2) Continuous mixing so as to bring the whole of the sewage into intimate contact with the activated sludge.

I think that agitating the sewage could be done more economically by mechanical mixers than by blowing in air, especially if tanks without corners were designed specially for this purpose.

With regard to the aëration, it should be borne in mind that the work is done by the oxygen which is dissolved, and when saturated, the amount taken up is only 7 parts per 1,000 by volume. There can be no doubt that the amount of air being pumped in is in excess of what is required for aëration.

THE SHEFFIELD EXPERIMENTS.

Since coming to this conclusion I have had an opportunity of seeing the suggested experiments made by Mr. Haworth, the chemist in charge of the Sheffield works. Mr. Haworth is agitating his sewage by a mechanical agitator and blowing air into the sewage by an extremely efficient form of screw, consisting of three screw propellers driven off one shaft, and has found that to saturate the sewage with oxygen, it is only necessary to use this aërator for two minutes every half-hour.

When you have seen Mr. Haworth's experimental installation, I am sure you will agree with me that the Sheffield investigation opens up a new field of thought and, like all that comes from Sheffield, goes a long way towards making the new process a business proposition.

A miscroscopic examination of the activated sludge shows it to be teeming not only with bacteria, but also with infusorial life. These bacteria and infusoria are not "anchored" as they are in percolating filters and contact beds.

This leads to special difficulties. The sludge containing the organisms which do the work sometimes floats, sometimes settles. The conditions under which it does one or the other will have to be discovered and special arrangements will have to be devised to prevent the sludge washing over. Again, when manufacturing wastes are discharged which are inimical to the organisms, the process of purification will stop abruptly. In times of heavy storms there will be a risk of the organisms being washed out of the tanks. It appears to me that the future use of this new process will be in combination with existing processes of purification, but that it is not fair to judge the new process by experiments on existing plants. Works to carry out this process should be specially designed. The tanks in which the activated sludge is working should have no corners, should probably be circular, and the whole of the sewage should be kept on the move by some mechanical process, and the tanks should be used continuously night and day. The separation of the sludge should take place in a specially designed tank with a sloping bottom at a high pitch, and the clarified fluid should be removed through floating arms. Again, in the tank where the aëration takes place, I think it is quite worth while considering the advisability of having suspended shallow filters of coke, a foot deep, on the top of the tank through which the air would bubble continuously and which might be drawn out of the tank in a cage for aëration.

RESEARCH WORK.

In conclusion, I want to call public attention to the necessity for the practical research work which is being done by members of our association being linked up with the work done in our universities. If we are to succeed as a nation, the linking up of practical affairs with our higher educational establishments must be much more close in the future than it has been in the past. There are many problems in connection with the purification of sewage which are obviously matters for university research. The engineering students in the university of Sheffield should all have the opportunity of sitting at the feet of such men as Mr. Haworth. It is only by getting in touch with the practical working of schemes such as that of the city of Sheffield that the problems which have to be solved can ever come to the knowledge of the professors of chemistry, electricity, biology, of the university. Much bigger grants from the State are required to enable these investigations to be made. The progress which Germany has made commercially is largely due to the State subsidising university professors who have worked for the benefit of German manufacturers.

We owe the activated sludge process to the fact that the university of Manchester was coupled up to the practical working of the Manchester sewage purification scheme, and that Dr. Fowler was working for the corporation and for the university. This is as it should be, and if we are to succeed this kind of connection must be multiplied in future all along the line.

Contractors' Claim for £97,000.—After twenty-eight days' hearing, the action of Messrs. Spencer, Santo & Co., Limited, contractors, against H.M. Office of Works was settled on Tuesday. The plaintiffs claimed £97,000 balance alleged to be due by the defendants in connection with the cost of the building of the new Local Government Board offices in Whitehall. The defendants agreed to pay £3,000, each of the parties to pay their own costs.

Canals and Waterways.—In reply to a question in the House of Commons on Monday as to whether any steps had been taken to consider the advisability of making preparations for carrying out any part of the recommendations of the Royal Commission on Canals and Waterways as a matter of national benefit and with a view to mitigating labour difficulties which were likely to arise on demobilisation, Mr. Harcourt stated that the recommendations in question would be borne in mind in considering the problems that would arise.

Revenue from Refuse.—The British De-Tinning Company, 75 New-street, Birmingham, are arranging for a meeting of representatives of local authorities to be held in London for the purpose of explaining their scheme for enabling those bodies to utilise waste metals—such as are found in town refuse—which have hitherto been exported to Germany and Austria. Among the public bodies which have already made a working agreement with the company is the Southwark Borough Council. The company has agreed to erect a building and plant at the Manor-place depot, at a cost of £3,000. When finished this is to be handed over in working order to the council, who in consideration are to pay the company 50 per cent of the additional profits made by its use. There is one hard-and-fast stipulation, and that is that the profits on the undertaking shall not be less than what the council was already obtaining by the sale of its waste tins, &c. The council are taking practically no risk, as the company are finding customers for the metal produced, which is to be paid for at pre-war rates, and any profits will be equally divided.

Public Abattoirs: A Comparison of British and Continental Practice.*

By H. A. BROWN, Engineer and Surveyor to the Weston-super-Mare Urban District Council.

As might be expected from the origin of the word, France was actually the first European country to establish public abattoirs on anything like satisfactory lines, and the fine buildings at La Villette—erected nearly fifty years ago—are still in advance of those of many Continental towns. Germany has developed the modern slaughter-house system in a wonderful manner, and her abattoirs to-day are, as a whole, the finest in Europe, but Switzerland and Holland in certain instances are not far behind; indeed, for practical purposes, and considering the restrictive legislation which hampers local authorities in this country, the fine abattoirs at Edinburgh will compare favourably with some of the Continental ones, and although the writer cannot speak from personal experience, he understands that the old slaughter-houses at Belfast have now been transformed into a most complete range of buildings for this work. It is, however, unpleasant to remember that, notwithstanding the enormous strides made in this country in sanitary science in recent years, the fact remains that in the twentieth century, while Paris has two of the finest municipal abattoirs in the world and no private slaughter-houses, London has nearly 300 private ones, and not a single municipal abattoir. The buildings at Islington and at Deptford are not taken into account; the former are hopelessly out of date, and the latter are used only for the killing of imported cattle. We have nothing to compare—except the two previously mentioned—with the Continental abattoirs, either in design, organisation or general arrangements, and the cause of this is not far to seek. In England the subject of slaughter-houses is so distasteful to the majority of people that the consideration of it is shelved until it becomes pressing, then it is dealt with in a hurried manner, as an evil which must be tolerated, while abroad it is approached both from the humanitarian and hygienic standpoints, and those engaged in this class of work are regarded as persons who are discharging the most valuable public duties. Indeed, the social status of an abattoir superintendent on the Continent is not lower than that of the average professional man.

The most practical illustration that can be given of the difference between the two systems is to compare the plans shown on Figs. 1 and 2. The former is that of a typical English abattoir for a town of 60,000 persons, erected at a cost of £7,000, while the latter represents a Continental abattoir erected at a cost of £18,000 for a town of 20,000 population. In this country the prevailing idea seems to have been to crowd as much as possible on to a small and often unsuitable site; the general arrangements being made quite regardless of any consideration for the animals. One writer on the subject says: "It is hard to realise that a country like ours, with such a complete sanitary system, public baths, &c., can tolerate for a moment the utterly puerile erections that have been thrown up from time to time and dignified by the name of 'Public Abattoir.' After having visited nearly all the public abattoirs of note in England, the writer can only state that the average English abattoir is a disgrace to our national intelligence, and that a worse set of buildings could hardly be designed."

These are strong statements, on which the author has no comment to make, but suggests that every engineer to whom this question is referred should visit the Continental abattoirs before preparing his plans. He will find palatial buildings in attractive surroundings, with shrubs, trees and grass plots introduced wherever possible, every wall in the place glazed internally, marble slabbed lairages, slaughter-halls wherein the animals are treated in a most humane manner, and a complete and elaborate system of meat inspection. In England it is supposed that such expenditure is wasteful, but such a supposition is hardly tenable in view of the fact that, notwithstanding the enormous capital expenditure, there is not a single public abattoir in Germany which is not self-supporting. While in England a prolonged and costly legal battle has to be entered upon in order to make any advance, however slight, in these matters, in other countries any public authority is empowered under the existing law to close private slaughter-houses, and erect new public abattoirs whenever they choose to do so, making such charges as are sufficient to maintain the buildings, pay the interest and sinking fund on the capital, and redeem any sums payable to the butcher by way of compensation in those cases where private slaughter-houses have been compulsorily closed. In some towns 8 per cent is allowed as the maximum to cover capital charges, and curiously enough the authorities are further empowered, if they so decide, to continue this charge, even after the loan has been redeemed. It is noteworthy that the period of repayment is longer than is customary in this country, and the following percentages from the balance sheet of one large Continental abattoir will be of interest:—

Depreciation on buildings	3·00
Machinery	13·00
Fittings and appliances	10·00
Lighting, &c.	15·00
Cold storage	15·00

This distribution of some of the profits was made to absorb the surplus funds, and the figures do not include

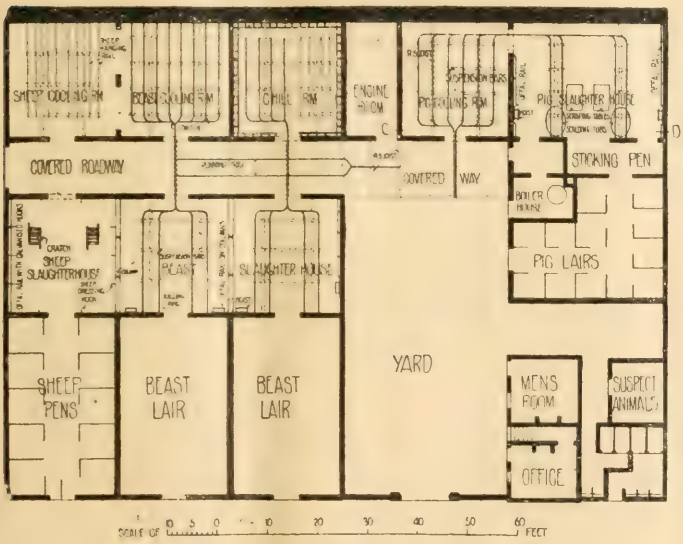

FIG. 1.—BRITISH ABATTOIR.

* From a paper presented at the recent annual meeting of the Institution of Municipal and County Engineers at Blackpool.

any repayment in respect of the loan. A point of interest to be noted is that the same or heavier charges are levied in the case of imported meat as in respect of animals killed in the abattoirs, so that no revenue is lost to the town by the butchers purchasing foreign meat. The following table may be taken as illustrative of the charges in force in some towns in Germany for slaughter dues :—

	s. d.	s. d.
Beasts	4 6 to 6	6
Pigs	2 6	
Calves	1 1	
Sheep	0 6	

And, in addition, special charges may be levied for veterinary inspection. The following are the charges in vogue in Weston-super-Mare and are representative of the average charges in this country :—

	s. d.
Beasts	1 0
Pigs	0 6
Calves	0 6
Sheep	0 3

It is also worthy of note that our Continental neighbours have solved the question of compensation for the closing of private slaughter-houses by increasing the charges for the use of the abattoir in proportion to the amount actually paid, with the result that very few of the claims have been admitted, and in the majority of cases have been ultimately withdrawn. This points to the advisability of securing Parliamentary powers before proceeding with schemes of this nature. Another point to which attention should be called is that in most cases on the Continent a charge is made for inspection of these abattoirs, but, what is more important, nothing is wasted, all the by-products, even to the sewage, being treated in some form or other, for the extraction of everything of value, an example which might be followed in this country with advantage. Practically similar arrangements may be seen in Switzerland and Holland, and in these countries, and so thoroughly has the question been dealt with that no one is permitted to trade as a butcher unless he has served his apprenticeship, and possesses a certificate of good health and competency.

BASIS OF DESIGNS.

A glance at Fig. 2 will show how complete are the arrangements for the various processes, and the excellent way in which the blocks are planned in relation to each other, all separated, either by open or covered passages. Provision is made for horse slaughtering, and there is a cold store and ice-making plant, the latter no doubt being a profitable undertaking. The one thing missing which is found in most abattoirs in Germany, is a bar or beer hall. These canteens are provided in many places, and result in considerable profit to the town authorities, and in a few instances there are also restaurants. The area of ground covered by the buildings in this case is about 4½ acres. The fault of the Continental system appears to be that a similar design is considered applicable to every conceivable set of conditions. For example, if one enquires the basis upon which the dimensions of the various buildings are calculated, one is referred to a table which sets out that for every person x sq. ft. must be allowed, and this appears to be strictly adhered to, the result being that in towns of fluctuating populations money is needlessly wasted if the maximum population be allowed for, and the premises are inadequate if the minimum or average is taken.

It is admitted that the broad principle upon which modern abattoirs should be designed is that the animals enter the buildings at one end and go through the various stages, ultimately passing out at the other end without having to go through the same block twice, or across an open roadway, and there are other conditions which appear to be important. The site should clearly be easy of access for the persons using the abattoirs; it should adjoin both the railway and the cattle market, so as to facilitate the delivery of cattle and to avoid the danger and annoyance caused by their being driven through the streets.

If noxious trades such as gut-cleaning and boiling are to be carried on in the abattoirs (which certainly should be the case) some consideration will have to be given to the prevailing winds so as to avoid a nuisance in the town, and it is undoubtedly an advantage to plan the buildings in the direction of the outfall so that the sewage does not have to pass through the town sewers, particularly if blood is allowed to enter.

[Mr. Brown's paper included some particulars of the recently opened abattoirs at Weston-super-Mare, but these buildings having been fully described in our issue of January 28th last, it is unnecessary to reproduce the matter.]

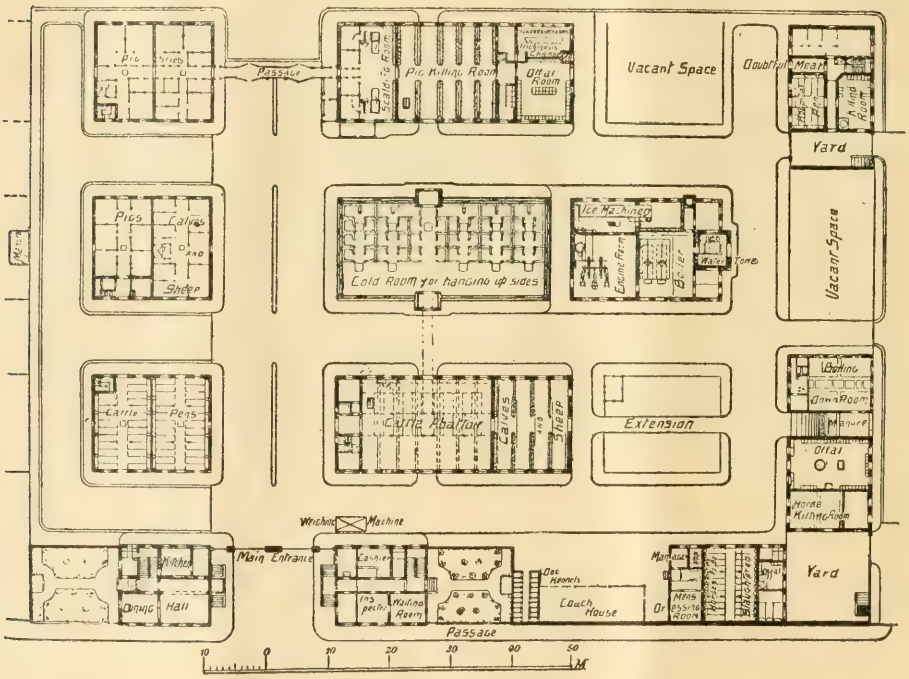

Fig. 2.—German Abattoir.

Association of Managers of Sewage Disposal Works.

ANNUAL SUMMER CONFERENCE AT SHEFFIELD.

The annual summer conference of the Association of Managers of Sewage Disposal Works took place at Sheffield on Saturday last. The proceedings, which included the delivery of the customary presidential address, reading of papers and visits to works, opened at the town hall, where the members were accorded a hearty welcome to the city by the Lord Mayor (Mr. F. A. Warlow). The attendance at the meeting included Dr. Sidney Barwise (Derby County Council), president, Aldermen S. Osborn (Sheffield), W. E. Rothwell (Bury), G. Lawrence and R. W. James (West Kent Sewerage Board); Councillors G. Clark (Chesterfield), C. W. Rothwell (Ashton-under-Lyne), J. A. Noston (Manchester); Messrs. C. F. Wike (Sheffield), A. B. Coomber and A. Scott Murray (West Kent Sewerage Board), R. Giles (Burton), G. Barford (Maidenhead), R. Otter (Leicester), H. Lumb (Todmorden), Alfred Stone (Bulcote), Charles H. Ball (Manchester), W. Tomlinson (Chesterfield), Charles Griffiths (Heywood), H. Edwards (Manchester), G. Fowler (Brighouse), Z. Degg (Stamford), H. E. Partridge (Stourbridge), C. M. King (Barnsley), A. Degg (Standford), A. Booth (Batley), C. Adkin (Worsboro' Dale), R. W. Adkin (Worsboro' Dale), J. Bolton (Bury), J. W. Gaskell (Honley), J. Taylor (Sutton), D. Robertson (Garforth), W. Cann (Fenton), Henry Burrows (Doncaster), John Priest (Bath), Norman Hall (Retford), Robert Lee (Ramsbottom), William Pattinson (Milnsbridge), J. H. Garner (Huddersfield), W. D. Scouller (Chester), W. J. Ashley (Oldbury), R. Tyson (Queensbury), J. W. Hartley (Stoke-on-Trent), J. Clifford (Nuneaton), J. Sheldrake (Ossett), Frank Naylor (Denby Dale), R. Higginbottom (Thurnscoe), A. V. Reynolds (Longton), George Alty (Ramsbottom), H. G. Foule (Sheffield), H. Oliver (Rotherham), A. Booth (Batley), J. Jones (Oldbury), Thomas Barlow (Denton), B. Butterworth (Crompton), O. Wilkinson (Manchester), James Bogden (Crompton), Frederick Hambleton (Newcastle, Staffs), W. J. Hadfield (Sheffield), W. L. Angell (Sheffield), William Jackson (Rivers Board, Sheffield), Charles E. Wood (Chesterfield), R. Frazer (Chesterfield), E. Sutcliffe Law (Haslingden), H. W. Stafford (Dukinfield), A. Applewhite (Lincoln), J. H. Kershaw (Rotherham), W. H. Makepeace (Stoke-on-Trent), John Haworth (Sheffield) and J. B. Croll (Richmond Main Drainage Works), secretary. Letters of regret for non-attendance were received from Messrs. Baldwin Latham, past-president, Percy Williams, W. H. Duckworth, P. Gilmartin and J. H. Abbott.

The LORD MAYOR, in his address of welcome, observed that Sheffield had spent during the past few years approximately £350,000 on sewage disposal works. The corporation now had in hand a scheme of further extension, which had received the approval of the Local Government Board, but, owing to the war, had been dropped. The question of trade wastes was one which he thought ought to receive the special attention of the association. If they could dispose of those wastes on modern and scientific lines without causing any disadvantage in other directions, they would confer a considerable benefit on the whole community.

Dr. Sidney Barwise, county medical officer of health, Derbyshire, afterwards delivered his presidential address reproduced on another page, a vote of thanks being accorded to him on the proposition of Mr. J. H. Barford (Maidenhead), seconded by Mr. R. Giles (Burton-on-Trent). As managers of sewage works, said Mr. Barford, they would feel very encouraged by what had fallen from Dr. Barwise. Several of Dr. Barwise's predecessors in the chair had been medical officers of health, and, looking at the interests of the association, he was bound to say that was about the best source from which they could derive their presidents.

"My Experience with Fine Grade Filters" was the title of a paper presented by Mr. W. H. Makepeace, ASSOC.M.INST.C.E., borough sewage engineer of Stoke-on-Trent. The contribution is reproduced elsewhere in this issue.

Mr. J. BOLTON (Bury), in moving a vote of thanks to the author, said the figures which Mr. Makepeace gave were a revelation when they recalled how in the earlier days they were given to understand the amount of suspended matter put on a fine-grain bed would rapidly choke up the filter.

The vote of thanks was seconded by Mr. A. V. REYNOLDS (Longton), and carried.

ACTIVATED SLUDGE EXPERIMENTS AT SHEFFIELD.

Mr. JOHN HAWORTH, F.C.S., manager and chemist of the Sheffield Sewage Disposal Department, followed with a paper describing the city sewage disposal works and experimental works. This paper also will be found on another page.

Mr. C. H. BALL (Manchester), in moving a vote of thanks to Mr. Haworth, said there could be no doubt that the question of activated sludge was one which overshadowed every other form of sewage treatment at the present time. He was uncertain how many years ago it was since Mr. Haworth had been conducting his experiments; he had gone on regardless of failures, and, so far as he could see, had gone on until at the present moment he was leading in this subject. Manchester, of course, had been closely associated with the question, and at both the Davyhulme and the Withington works they were increasing the experimental plant. The question was in its infancy, and while it could be taken up by all and sundry, it could not but go forward. To those who had not tried the method he would seriously recommend it. The position of Manchester as regarded trade wastes was, unfortunately, somewhat similar to that of Sheffield. He had to contend with a considerable quantity of acid wastes, which had a marked effect on the bacteria in the activated sludge, and it was a question which they would have seriously to consider as to how these occasional heavy doses of acid waste were to be met. Mr. Haworth, he noticed, had a considerable discharge, and one of the results had been that the tank went out of action for several weeks. That was very serious, because they could not have sewage works going out of action. In regard to the distribution of air, there were many methods being tried at present. The porous tile was one. In Manchester they had made several experiments. For instance, they had used an open pipe, the air from which came up in large bubbles. That, however, meant an excess of air, and they were anxious that the minimum amount of air should be used. The experiments which they had conducted had shown them that one of the tiles which gave the best results was the "Filtros," an American product, though this was rather expensive. They had also experienced the trouble of cracked tiles. When that occurred the whole of the air at the point affected was discharged, the sludge became stagnant, and the process went out of action at that particular spot until the tile was replaced.

Mr. J. H. KERSHAW (Rotherham), in seconding the vote of thanks, said that after what would be seen on the visit to the works in the afternoon he thought it would be agreed that the activated sludge process was not going to be worked by any system of porous tiles or air compressors. The question of the effect of trade wastes on this new process was, of course, very important, for, as had been said, they could not afford to stop a tank for weeks. As a result of experiments with a sewage containing gas liquor refuse, he had found that sulphur cyanide could be eliminated by this air-blowing process, though, of course, it could not be done on a big scale.

Mr. W. H. MAKEPEACE (Stoke-on-Trent) said he had always maintained that the solution of the sewage problem would come from a direction such as this. He had an opportunity some years ago of seeing the Manchester experiments being conducted on these lines, but felt from his observations at the time that the most formidable obstacle in the way of the development of the experiments was the amount of air required. After reading the paper it had occurred to him that in his cylindrical arrangement Mr. Haworth had a possible means of economising the air. The only point that had occurred to him was how long it took to agitate the sewage and to bring about the results he had recorded. The success of this proposition depended, of course, very much on that. With the object of reducing the enormous

consumption of air he had been conducting experiments with three or four vessels, the surplus air from the first of which was conveyed in turn to the others. The results he obtained were quite satisfactory, and the amount of air required to bring about the purification was dependent entirely on the number of vessels used.

The vote of thanks was passed.

Mr. Haworth, in replying to the points raised, stated that the actual experiments in aëration commenced some four or five years ago, when they were dealing with the question of some form of secondary treatment. The position at Manchester as regarded trade wastes was evidently the same as at Sheffield. He had known samples of sewage at a given time contain as much as 2 parts per 100,000 of free sulphuric acid—that was where the wastes were discharged in the vicinity of the sewage works. It was one of the problems in connection with the process. At Sheffield there had been a considerable amount of fungoid growth inside the porous tiles, and the fact that there had been no such trouble at Manchester showed the desirability of each sewage being treated on its merits. With regard to the question of the selling of the sludge as manure, he was always suspicious when fortunes were spoken of in connection with that. As a matter of fact there was considerable prejudice against the use of sewage manures; farmers he had met had a great objection to it and there was also the sentimental objection of the public. The question had been asked how long it took to get the effluents of which he had given particulars. For some time he worked the tank—in which there was no blowing—by filling it once a day. He had filled it more often, and he found at the present time that he could get an effluent with an oxygen absorption of, say, 1·5 per 100,000 in from two to three hours. It was his intention to work one of the experiments to destruction—to increase the load until the treatment ceased. Concluding his remarks, Mr. Haworth said he was anxious that the development of the activated sludge process should be taken up on a sound basis. They knew how often sewage managers' difficulties were increased by having works hastily put down before a process was properly thought out. He did not want that to happen with this process.

MIDDLESEX ROADS.

COUNTY ENGINEER AND ECONOMICAL MAINTENANCE.

The condition of the main and subsidised roads maintained by the urban and rural district councils in the county of Middlesex is dealt with in the eighteenth annual report of the county engineer, Mr. H. T. Wakelam, M.Inst.C.E., F.G.S.

"With the continuance of the war," says Mr. Wakelam, "and the consequent withdrawal of further labour from the roads, adverse maintenance conditions are now being experienced in the county to a far greater extent than during 1914-15, and the question of providing even passable surfaces, especially on some of the macadamised roads carrying heavy traffic, is becoming an increasingly difficult problem. Owing to the unavoidable difficulties an informal conference with the engineers and surveyors of the different local authorities was held, with a view to endeavouring to frame some sort of procedure under which the best and most economical measures could be employed.

"At the conference, which took place at the end of 1915, I impressed upon the various engineers and surveyors present the need for keeping the various roads to at least a standard of repair by carrying out as much 'patching' work as possible; and at the same time I asked them to economise as much as possible in the direction of scavenging and watering, with a due regard to sanitary requirements from a health point of view. The point was emphasised that it was not sound economy to allow any given road to get into such a state of disrepair as would necessitate a large expenditure upon it at the end of the war, and this was, I think, fully appreciated by all present. Since the conference the question of economical maintenance has resolved itself into a serious problem. At present, owing to the requirements of the War Office, and other factors, it is difficult to carry on road works of any kind. Labour, transport, and supplies of materials are extremely limited and uncertain, and in my judgment it will only be by the tar-painting work, now being carried out on the surfaces of many macadamised roads, that these will be made sufficient for the summer months. During the forthcoming winter a deterioration is to take place.

STORAGE OF MATERIAL.

"I call attention to this point, so that all the highway authorities of the county may take time by the forelock, and store as much material as possible during the intervening months and before bad weather sets in. Further, wood blocks, asphalt, asphaltic materials, &c., have advanced so much in price that should supplies of metalling, of a basaltic or granite nature, become more difficult to obtain, it will be almost an impossibility to go to the expense of permanent surfacings. It will therefore be recognised how difficult it will become to carry on road works under such conditions, unless provision is made in advance, and it is only fair to ask that the indulgence of the public may be extended to the county council, and also to the other authorities, should any of the main roads drift into a state which may appear to be unworthy of a great county like Middlesex.

WORK AFTER THE WAR.

"The reinstatements of roads at the end of the war, which I have already mentioned, will no doubt furnish employment for large numbers of men. In addition to the arrears of work in connection with water-bound roads, there are several miles of wood-paved carriageways in the county which will probably have to be renewed. Should the Road Board be amalgamated with the Local Government Board it will be well, when the time arrives, for applications to be submitted to the Local Government Board for grants towards the anticipated reconstructions which will have been chiefly caused through the character of the traffic the roads of the county have been carrying during the greater part of the last two years. In connection with the total estimated cost, £17,515, of tar-painting work on the main light railway and subsidised roads of the county during the ensuing year, an application for a grant has been submitted to the Road Board."

The various reports in detail follow, attention being called in several cases to the necessity for repairs alongside the tramway margins. In a comparative statement, printed as an appendix to the county engineer's report, the total cost per mile of maintenance and loan repayments, in respect of main roads maintained by the county council, is given for the past three years. The difference is shown to be very considerable in some cases—*e.g.*, Bath-road, 1913-14, £623 17s. per mile, 1914-15, £951 10s.; Kingston and Staines road, £459 8s. 8d. and £550 13s. 2d.; Bushy Park, £517 10s. 3d. and £587 10s. 11d.; Staines-road, £866 17s. 6d. and £993 8s. 11d.

Hull's Petrol Substitute.—The recent report that Mr. F. W. Bricknell, the city engineer of Hull, had made a contract for six months with a local firm of producers for the supply of a petrol substitute at 1s. 6d. per gallon proves to be inaccurate. The corporation, we are informed by Mr. Bricknell, are buying what is equivalent to "Taxibus" at "Taxibus" price.

Leeds Sewage Works.—In the course of the annual inspection of the Leeds sewage undertaking at Knostrop, recently, Alderman Oldrod gave some details of the Knostrop scheme. The total cost, he said, would be £1,277,000. Of this sum, £207,000 was for new main sewers. Since 1908 the committee had expended on land and works £477,639. There were current contracts entered into and remaining incomplete to the value of £375,000, and of these they had carried out work to the value of £172,000. The cost of operating the sewage works last year was £13,681 as compared with £12,134 the year before; the difference was accounted for by rates and taxes, coal, and increased wages and war allowances. The working cost of treating 1,000,000 gallons of sewage last year was £2 10s. 7d., an increase of 8s. 4d. as compared with the previous year. Last year they pumped a daily average of 15,000,000 gallons of sewage, out of which was extracted no less than 36,000 tons of pressed sludge cake. Of this, 5,000 tons was sold to farmers as manure, and 31,000 had been tipped on to the low-lying lands of the estate, at a cost of about 9d. per ton. They had been trying to find means of making the sludge cake more saleable, and when the war broke out they were on the point of experimenting with machinery to render the cake into powder, in which form they might be able to get farmers to use it more extensively.

ALEXANDRA BRIDGE, PIETERMARITZBURG.

THE CANTILEVER PRINCIPLE IN REINFORCED CONSTRUCTION.

About three years ago the Pietermaritzburg Municipal Council decided to replace an old wooden bridge, which for thirty-five years had carried the main road over the Umsindusi River from the city proper to the suburbs of Scott-ville, Alexandra-road and Pentrich. Preliminary designs were prepared for the new bridge to determine whether it would be advisable to use steel or reinforced concrete in the new structure.

After careful consideration, the council decided in favour of the reinforced concrete bridge, because it was shown that in comparison with a steel bridge the former was less costly to construct and maintain, that it had a longer effective life, and would prove more elegant in appearance. Mr. James Just Niven, M.INST.C.E., the borough engineer of Pietermaritzburg, who was primarily responsible for the design, consulted with the Trussed Concrete Steel Company, Limited, and engaged them to prepare the detail drawings for the reinforced concrete work on the Kahn system of reinforcement.

ALEXANDRA BRIDGE, PIETERMARITZBURG, NATAL.

The new bridge was opened to traffic about the middle of last year, and has fulfilled all expectations in regard to the method of construction adopted. It is a graceful structure, in a beautiful setting of green foliage, with the Umsindusi River flowing underneath at a depth of 40 ft. below the level of the roadway.

The bridge comprises two symmetrical cantilevers, each resting on a pier of mass concrete built on the

solid rock bed of the river. The principles of the design of this bridge are similar to those employed in the design of the famous cantilever bridge over the Firth of Forth, and this is probably the first occasion on which such principles, hitherto used only in structural steel bridges, have been adopted in the case of a reinforced concrete bridge.

In this instance the cantilever members are curved, thus giving the appearance of an arched bridge with a central span of 75 ft., flanked at either end by a half arch of 38 ft. span. The entire weight of the bridge, and of any uniformly distributed live load upon it, as well as any combination of loads balanced about a supporting pier, are carried by the cantilevers, and are transmitted as vertical loads to the two piers.

The centre span, consisting of the two half cantilevers abutting each other, is also designed as an arch to provide for any unequal loading upon it. Any unbalanced load on the two end spans is carried by the half-arch cantilevers acting as beams supported at one end on the main pier and at the other end by the light abutments constructed at the extreme ends of the bridge. This arrangement has produced a design which is not only economical in the use of materials, but which requires very light end abutments, because the maximum load they will be called upon to carry at any time will be only that due to inequality of loading without the weight of any portion of the main structure.

The bridge is 170 ft. long and 30 ft. wide between the parapets, having two footpaths each 5 ft. wide and a roadway 20 ft. wide. The two outside arches are 20 ft. apart with the 5-ft. footpaths cantilevered from the decking of the roadway. This adds to the pleasing appearance of the bridge.

The bridge was designed to carry a maximum load of two 12-ton traction engines, each hauling a train of six trucks loaded to 6 tons each, with an additional distributed live load of 100 lb. per super. ft. Immediately after its completion and before it was opened to traffic, the bridge was tested by running a 15-ton steam roller over it. The maximum deflection recorded was about one-twentieth part of an inch, or one-eighteen-hundredth part of the span. Upon the removal of the load the bridge assumed its normal condition.

The total cost of the bridge was £5,625, which included the cost of the demolition of the old structure, the erection of temporary bridges and other works, the formation of the macadam roadway, the footpaths, the electric lighting, &c. Whilst the bridge was being erected the opportunity was taken of raising its height some feet above the level of the old bridge, so as to improve the gradients of the approach roadways and to raise it above the flood level of the river. The cost of the embankments, inclusive of reinforced concrete fencing, extension and alteration of the storm-water drains, the electric light cables, the water-mains, &c., was £3,817. These figures represent the actual cost of the work as paid to the contractor. If the usual 5 per cent be added for designs and supervision these amounts would be approximately £5,906 for the bridge and £4,008 for the approaches. Assuming the effective life of this construction as 100 years, and maintenance expenditure during that period at an average of half per cent per annum, the cost works out at £90 annually.

As previously mentioned, Mr. James Just Niven, M.Inst.C.E., was responsible for the general design of the structure and adopted the Kahn system of reinforced concrete after giving due consideration to this form of construction. The contractors were Messrs. Peattie & Stannard, of Pietermaritzburg, who carried out the work under the supervision of the resident engineer, Mr. W. C. Thornely, in succession to the Late Mr. J. D. Keith, Assoc. M.Inst.C.E.

Road Tarring and Fish Life.—The question of river pollution and the disastrous results upon fish from the use of crude tar upon roads was raised at the annual meeting of the Salmon and Trout Association, held on Tuesday at Fishmongers' Hall, London. A suggestion by Lord Desborough that a Bill might be promoted in Parliament enabling an individual to take action against anyone who used crude tar for road making or mending met with approval, and, on the motion of his lordship, it was agreed that the matter should be referred to the Experimental Committee, with powers to instruct counsel to draft a Bill to lay before Parliament. Lord Desborough mentioned that he would be prepared to introduce such a Bill into the House of Lords.

CORRESPONDENCE.

Εἷς ἀνὴρ οὐ πάντ' ὁρᾷ
(One man does not see everything.)
—Euripides.

MUD AS A BUILDING MATERIAL FOR COTTAGES, &c.

To the Editor of The Surveyor.

Sir,—I am interested in the subject of mud as a building material, and no doubt there is a future before it. As an English nation we are very slow in moving out of our usual groove, which is often detrimental in many ways to our advancement. Surely if it is possible to cheapen the erection of cottages or other buildings by the introduction of mud as building material we should endeavour to use it!

The general objection to its use at present seems to be its unsuitability to our climate, but this may be overcome. It has already been suggested and experiments are being tried to render the outside surface proof against driving rains and damp atmosphere by the introduction of lime, cement, soft soap, water glass, &c., in the finishing coat of mud. The difficulties arise from the proper mixture of mud with either of the ingredients above named, and coating with lime or cement, so as to make a satisfactory adhering coat.

I would suggest one of the following methods as being more practical and efficient. One way is to build a 2½-in. or 3-in. brick wall all round the structure. This is done by building brick on edge instead of the usual method of laying them on the flat, with iron ties at intervals, similar to those used for hollow walls.

The second method is to fasten wood battens to the wood wall-plate which supports the roof, driving the foot of the batten into the ground before fastening the top. Upon these battens, which only need be slating laths, and should be fixed about 12 in. or 15 in. apart, is stretched ⅜-in. fowl-run netting. It is preferable and cheaper to use the painted netting (black) than the galvanised netting. Another and better method would be to fasten "Expanded" metal lathing in lieu of the fowl-run netting. The fowl-run netting is the cheaper. Use the half-mesh X 19 gauge wire—it is the strongest small mesh made.

A coating of cement will not adhere to the earth, but the above is a very cheap way to form a key upon which to render two coats of cement to a total thickness of ¾ in.

As neat cement and sand is not waterproof, I would suggest a mixture of the waterproof powder "Pudlo" in the proportions of 3 lb. of waterproof powder to every 100 lb. of cement if mixed 3 and 1.

I have had a long experience with this treatment when using cement, and it has proved effective against the ravages of damp, rain, &c., in any exposed position.

Sun-baked mud blocks mixed with straw are constantly being used in Norfolk, both in Diss and Watton. They are faced with bricks, and the tenants say they are very warm in winter and cool in summer.

—Yours, &c.,

Excelsior.

TRANSPORT REFORM.

To the Editor of The Surveyor.

Sir, Mr. Collins questions my figures on motor transport costs; they will naturally vary, as they depend on the load; my point, however, is that a manufacturer suits his vehicle to his goods, and therefore obtains the maximum efficiency. The railway company makes its trucks to suit the heaviest load, and on the average obtains a much lower tonnage; thus, in comparison, the cost per ton of goods on the railway is high. Then the motor costs are reckoned on the out and home journey, whereas in my comparison I worked the railway costs on the outward journey only.

The argument that I put forward is that, on the whole of the facts available, there is little to choose between railway transport, even with the clearing house system, and motor transport under good road conditions.

I raise no objection to the clearing house system as such; I doubt very seriously that it will realise the economies that are said to be in its train. That 5,000 vehicles will do the work of 100,000 vehicles in London is, in my view, absurd. I am inclined to doubt even if there are 100,000 trading vehicles in London—the motor 'bus is the most prominent, and yet there are only 3,000 odd vehicles of this type in London.

Transport Reform	26, 35

The correspondence has been merely to indicate that roads are of much greater importance than the clearing house and railways, and that the adoption of the clearing house will not in any way relieve the pressure on any of the traffic that is now on the roads, and that motor traffic will greatly increase.

Mr. Gill has done me the honour to write to me. I did not doubt there were seventy-four goods stations; I merely do not know where they are, they may be in existence; but I mentioned three of the largest goods stations in the West of London, and if these are not to be dispensed with, then the goods that are now sent to these stations will obviously continue to be sent there. He also says there are fifty passenger stations that are used for goods. A station is worked on commercial lines, i.e. the revenue it receives is put against its working costs, and it pays for itself by the goods and passengers it receives and the clearing house deprives it of part of its revenue, then, according to the scheme, it will have to repay the station for its loss. It would therefore seem to be a case of taking it out of one pocket and putting it in another; the public not gaining anything.

The building that is proposed, if it is the size that one can judge from the drawings in the pamphlet, is open to serious criticism, but I do not propose to touch upon this. I think I have said sufficient to prove my points, and that they should not be replied to, but one left to an indefinite statement that they are dealt with in a book by Mr. Roy Hermman, only tends to strengthen my case. Yours, &c.,

FRANCIS WOOD, M.INST.C.E.,
Borough Engineer and Surveyor.

Fulham.

REINFORCED CONCRETE AND FERRO-CONCRETE.

To the Editor of THE SURVEYOR.

SIR,—In his admirable presidential address to the Institution of Municipal and County Engineers, Mr. Brodie very wisely proposes that a clear distinction should be drawn between genuine reinforced concrete and the nondescript form of construction wherein concrete and steel are used together, but not in scientific combination.

But his suggestion that the term "ferro-concrete" should be applied to the latter cannot be entertained for a moment. The fact is that the terms "reinforced concrete" and "ferro-concrete" are universally employed by engineers, architects, municipal authorities, and the public at large to denote the same thing. Moreover, the designation "ferro-concrete" was adopted some twenty years ago by the late L. G. Mouchel to denote the then new scientific combination of concrete and steel, now officially known as reinforced concrete, which for many years was represented in this country solely by Mouchel-Hennebique ferro-concrete. Although the term was not registered as a trade-mark, it has for a long period of years been identified with the Mouchel-Hennebique system, the reputation of which would clearly suffer if the definitions proposed by Mr. Brodie were generally accepted.

While no distinction can be drawn between "reinforced concrete" and "ferro-concrete," as these expressions are used to-day, there is a very real difference between the scientific combination of concrete and steel, and steelwork merely encased in concrete. The latter is what Mr. Brodie evidently desires to characterise by a new name. The choice of an appropriate designation presents no special difficulty, but it will not be so easy to secure its adoption, either by Government authorities or by those who have reasons for hoping that the superior properties of "ferro-concrete" or "reinforced concrete" may be attributed to varieties of construction simply embodying concrete-protected steelwork.—Yours, &c.,

W. NOBLE TWELVETREES,
Editor of *Ferro-Concrete*.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Doncaster R.D.C. (July 7th. Mr. George L. Pepler). This was an inquiry with respect to the application of the rural council for permission to town plan the parishes of Armthorpe and Kirk Sandall.—Mr. H. M. Marshall, clerk to the council, explained that a series of town-planning schemes were being promoted by the rural council, and there were others to follow, intended, together, to cover the whole of the area within the council's control. The area covered by the present scheme was 1,560 acres, at present purely rural, there being only about 450 inhabitants. The chief reason for the application was that a large colliery was in course of development at Armthorpe, and it was understood it was going to be the largest colliery in this new Doncaster coalfield district. It was part of the enterprise of the colliery company to erect a garden village, which, it was agreed, should fall in with the council's scheme of town planning. The colliery company proposed to put up a thousand houses. The town clerk of Doncaster (Mr. Tovey) stated that the corporation's sewage works were in the district proposed to be town planned. They were proposing a bacterial scheme costing upwards of £100,000, and they would not want that scheme interfered with.

APPLICATIONS FOR LOANS.

Essex C.C.—£6,900 towards the purchase of the site for the new county offices at Chelmsford.

Salford T.C.—£3,029 for the electricity undertaking.

LOANS SANCTIONED.

Abercarn U.D.C.—£800 for a dehydration plant at the gasworks.

Haslingden T.C.—£1,150 for electric mains and £550 for switchgear.

Middlesex C.C.—£372 for making up a road at Hayes.

South Shields T.C.—£1,117 for a motor fire engine.

FORTHCOMING INQUIRY.

	JULY.	£
19.	**Kettering.** For the purpose of the public baths (Mr. F. H. Tulloch) . .	650

Municipal Employees' Service Allowances.—Walsall Town Council have decided, in view of the effect of recent legislation, that in future any allowance given to corporation employees on active service should be based on a stipulation that the total pay should not exceed a man's civil pay by more than 10 per cent, except that in the case of married men holding commissions the limit should be an excess of 25 per cent. The mayor mentioned that it was felt that nothing should be done to discourage men who were in the ranks from accepting commissions.

Institution of Municipal and County Engineers.

ANNUAL GENERAL MEETING AT BLACKPOOL.—(3.)

Following the speeches reported in our last week's issue the discussion at the recent annual meeting of the Institution of Municipal and County Engineers at Blackpool on the paper by Messrs. H. R. Aldridge and H. Shawcross, on the subject of

OBLIGATORY TOWN PLANNING

was continued by Mr. J. A. Brodie (Liverpool), who said he thought they could travel a considerable distance in the way of compulsory development if they were satisfied that by travelling in that direction they were going to get satisfactory results. He was not what they called an out-and-out believer in forms and that sort of thing in connection with the present Town Planning Act. They in Liverpool, as the members knew, were fortunate in having their exceptional powers with regard to such matters as roads and the development of any areas within the city boundary. No area could be developed within the city boundary under their 1908 Act, unless that area was developed in such a way as to meet the requirements of the public authority. It was a rather exceptional power, but, at the same time, it was an exceedingly valuable power, and the man who sent in his plan, whether in a town planned area or not, had to show on his preliminary plan the direction of the roads he proposed to make. He thought he could travel in the direction of compulsory town planning if he was assured that the compulsory powers were of a sufficiently general nature. He thought that Parliament ought to say, and to say without quēstion, and in a strong and determined way, that it was the duty of the public authority—whether it was urban or rural—to see that whatever was done in connection with housing and planning was done on first-class and sound lines. If they had certain powers which Liverpool had with regard to roads, if they had certain powers which Liverpool had, fortunately, to reduce street works on certain areas, where the owner or developer would give additional land in places which were of real advantage to the public, they got certain points with which the local authority could negotiate. He believed that rather than follow on the lines of their town planning methods, which he thought were open to very considerable improvement, they ought to deal with it as far as possible on general lines and make it the duty of the authority to see that it was properly done, and give them ample rights with regard to wide roads where wide roads were required, and give them powers with regard to narrow street works and narrower roads than were now allowed where there was no through traffic. They must, of course, have room for two vehicles to pass each other—that was not questioned. With regard to street works, he wanted to say that while they had narrow street works they insisted upon adequate space between houses, so that the question of air space between houses was properly protected.

The President (Mr. J. S. Brodie): I take it that your Act is really a compulsory Town Planning Act?

Mr. J. A. Brodie: It would have been a compulsory Town Planning Act if it had got through Parliament in the form in which it was presented. Parliament in its wisdom gave them some powers for which they were duly thankful. They asked for certain other powers, such as the restriction on the number of houses per acre, and offered certain benefits if owners gave up certain spaces, but Parliament did not pass those; it said that was town planning, and would be dealt with by the general Act.

Mr. T. Salkield (Delhi) remarked that Delhi had recently loomed very large, because it had become the Imperial capital of India. He thought the institution had every reason to be proud of the fact that Mr. Brodie was the engineer selected by the Government of India to advise them on the development of that city. Delhi offered an enormous field for town planning. They had got a population of 300,000, which was chiefly confined within the city walls. Unlike the walls of Jericho, the walls of Delhi were having to give way to the human pressure within those walls. They had recently started on the demolition of some of those walls. His architectural friends were very angry when they started the demolition of the city walls, but they had no historical interest whatever, and they had made a very fine circular road round the city which would in future be found very valuable. To the south of the city the Imperial authorities were carrying out the plans, which were prepared by Mr. Brodie and one or two other gentlemen. The municipality, on their part, were very busy carrying out important works to the west of the city. The first road along the line of the fortifications had been a huge financial success. In dealing with the Town Planning Act, engineers had to be utilitarian, and unless they could show that their schemes were going to pay they would not get very much "forrader." The work had been so successful that they were about to start another scheme on similar lines. They might be very backward in many respects in India, but there were some things in which they were up to date. This question of town planning was one which had been very seriously considered by them. Delhi was in the very enviable position of having the Government of India in their midst, and so they were able to get money from them, which was very helpful to the town.

Mr. H. Aldridge, in reply, remarked that not one of the speakers had objected outright to obligatory town planning. In other words, they had reached the very interesting transitional stage from objection to a new idea to a kind of suspension of judgment in regard to it. Later on, inevitably they came to the visionary point of view when the new idea was accepted. One or two had asked: "What is it going to cost?" Might he counter that with another question: "What is it going to cost you to leave it alone?" That brought him to the remarks made by his esteemed friend Mr. Harpur. He did not tell them one thing. One of the men responsible for raising the status of Dowlais was Mr. Harpur himself. It was because of his loving care that he was prepared to defend it. Alderman Muirhead, speaking of Scotland-road, Liverpool, said they were not keen on dealing with the slums. He was keen on that. He believed it was very largely the fact that they put all the energy they could into the support of Mr. Taylor's Bill that brought about the carrying of that Bill through the second reading stage, when only sixty members voted against it. Whenever people came to him to ask what was being done in this country he always sent them to Liverpool to see the splendid work they were doing there. The moral of it was that they got Dowlais and Scotland roads whether they liked it or not, because towns had grown up higgledy-piggledy. Mr. Hall had told them what had happened at Felling-on-Tyne. The same thing was going on in South Yorkshire. They had this intolerable position that in the district where the people worked the hardest they got the least amenities, and in districts where people had most leisure they had amenities all the time. It was not right; it was not fair. If the men of this country were not dissatisfied with conditions of that sort, then they ought to be, and it was the duty of every man to evoke what Carlyle called the spirit of divine discontent. He was hoping they would send a deputation to the Government, asking them what they proposed to do in the period after the war. He wanted to thank that older visionary, Alderman Bainbridge, for his point about buying stone at 7s. 6d. and selling it at 1s. 6d. The people responsible for such things were not the visionaries at all, but the hard, practical men who never saw an inch beyond their own noses. He believed the Government would back them up very strongly, and, though it might mean more work for surveyors, he was sure they would be pleased to give their help. The more energy they put into the details of this work, the more certain would be the accomplishment of some things which they had regarded as visions.

Councillor Shawcross, in reply to Alderman Muirhead's statement that they did not tackle the slums, said he had worked fifteen years with the Housing Committee, and the first five years were devoted to bringing out the condition of the slums of the big cities. Their work did a great deal to cause the

public to realise the conditions in many of our towns. He had every admiration for the Ruislip-Northwood scheme, and the parts put into it, but the conditions in Ruislip were entirely different to what they were in other parts of the country. That scheme was not at all applicable to Lancashire, and he was certain that they must have something more elastic than that when they got obligatory town planning. He was pleased to hear practically no dissentient voice as to the need for some sort of obligatory town planning. They could let towns like Liverpool and Birmingham have more discretion and control than they could grant to small areas. If they did not do something in the next ten years, perhaps 1,000,000 houses would be built in this country with narrow streets and little bits of back yards.

FUNDAMENTAL AND ECONOMIC CONSIDERATIONS IN RELATION TO TOWN PLANNING.

On the presentation of Mr. Ross Young's paper on this subject reproduced in our last issue Mr. W. HARPUR (Cardiff) said he was entirely in accord with the idea of deciding as to the industrial side of a city before they planned it. That was to him the great mistake which was made up to the present. What were they to plan for, unless they knew what it was to be and where the railways were going. If a railway came they could not say it was not to be constructed because it disturbed their town plan. If works were to be erected they could not be refused because they upset their town plan. If a colliery wanted to sink a shaft, were they to say it could not be sunk because it upset their town plan? This was the right line to go upon, and they must go slowly. If they went too fast they would do more harm than good in the matter of town planning.

Mr. A. H. CAMPBELL (Edinburgh) said they pleaded for going slowly, yet in seven years the number of schemes passed in England could be counted on the fingers of one hand, and in Scotland there had been none. He advised them to take the real practical part of the problem and secure their cities from the narrow, confined streets, flanked as they were by meaner buildings, which spoiled the approach to their city. They could reduce the density of buildings; they could provide open spaces, and they could bring some amenities of country life to town dwellers.

Mr. S. S. PLATT (Rochdale) said he quite agreed that they should start with the preparation of a town plan independent of railways or anything else. If a railway company or anybody else had got anything in their mind as to the development of the district that was the time to bring it along, and not wait until afterwards and then upset everything. With reference to the remarks in the paper about a ship canal linking up the Forth and Clyde, if Mr. Ross Young would go down to Trafford Park he would see the great development which had taken place there from the ship canal. It was amazing what great developments had taken place. Mr. Ross Young mentioned that schemes would often have to embrace the territory of several local authorities. They had found it necessary to do that in Rochdale for the preservation of the amenities of their own area. They had got the power to prepare a scheme of town planning 1,600 acres of land, 500 acres of which were outside their borough in the districts of two other authorities. He would like the members to take careful note of what was brought out in this paper and that of Mr. Shawcross. He had been associated with Mr. Shawcross in two schemes, and could say that he took a broad and cultivated view of the whole question. If they thought it necessary to extend outside their own district, his advice was "go and do it."

Mr. P. C. SMITH (Dunfermline) said he confessed when he read first the paper he thought it very visionary. He said "Ross Young wants us to start a town plan at Edinburgh and finish it at Greenock." The paper was really an argument for the obligatory town planning of rural districts. Take his own district of Dunfermline, where development was taking place and where they had a town plan. The neighbouring burgh promised to town plan for themselves, but since they gave the promise nothing had been done, and the town plan of Dunfermline was practically cut through at the confine of the other burgh. If they would not town plan, some compulsory powers ought to have been applied, so that the scheme on the east side of the city should not be spoilt.

Mr. A. W. WARD (Shrewsbury) said he would like to say a word in appreciation of the paper, which was packed full of common sense. The author said the time had arrived when the question of better organised transport facilities seemed to be on the point of a rapid transformation, and when all grades of traffic would be dealt with in a more scientific manner. Coming as he did from Shrewsbury, the centre of an agricultural county, that appealed to him. Before going there he never thought of freightage and the carrying of goods to market expeditiously and cheaply. When were they going to see that the canals were no longer made derelict? When were they going to have some proper plan for rural districts and the carrying of their produce? If ever there was a strong argument for obligatory town planning, it was the density of the population of Belgium. In Belgium there were only four towns of over 100,000 population. Yet the density of the population of Belgium—a country less than the size of Yorkshire—was twice that of Bengal, which had the second highest density in the world. Was there not something for this country to learn in that?

Mr. Ross YOUNG, in replying, said he knew Mr. Campbell was very impatient about some of his schemes, which had been hung up for a good time, and he seemed to be rather irritated that he should go back to the A B C of town planning. Mr. Smith had said that if he (Mr. Young) had his way he would plan all the way from Edinburgh to Greenock. Well, that included the industrial belt of Scotland, and if he had his way he would have a town plan for that area.

(To be continued.)

ROAD MAINTENANCE IN HEREFORDSHIRE.

"HEAVY EXPENDITURE AFTER THE WAR."

Mr. G. H. Jack, M.INST.C.E., county surveyor of Hereford, states in his annual report that his estimate for the year ended March last has been underspent to the extent of £10,238. "This means," he says, "that the useful work of this department has been impaired to this extent. The rural main roads have suffered to the extent of £8,655. It has been quite impossible to obtain the necessary materials, haulage and labour. All I can say is that the best has been done under exceptionally trying and difficult circumstances."

The cost per mile of the rural main roads in the county was £63, as compared with £75 in the previous year, and that of the urban main roads £176, as compared with £213 in 1914-15.

Mr. Jack warns the county council that the impossibility of executing necessary road repairs now will mean a heavy expenditure after the war. "The cost of reinstatement," he points out, "will be much higher a year hence than it would be at the present time, and many lengths may have to be entirely recoated."

Dealing with Road Board work, he remarks that the assistance received from the board has been a very great benefit in strengthening and resurfacing parts of the principal main roads. The work of surfacing with tar-macadam during the ensuing year is estimated to cost £7,675. This will enable the council to put a wearing surface upon the foundation work which was laid down in previous years. It was hoped that the scheme of road improvement would be completed this year, but it may be necessary to carry the work on for some time longer owing to the shortage of labour and other difficulties.

Mr. Jack's office staff, which numbered seven before the war, has now been reduced to one clerk and an office boy.

New Water Supply for Holderness. The inauguration of the new water supply provided by the Hull Corporation for South Holderness took place last Friday. The new area comprises 200 square miles, and the townships of Hedon, Patrington, and Withernsea are included. Two reservoirs and a water tower of a total storage capacity of 400,000 gallons have been constructed near Withernsea, one to supply Withernsea and the other for the extensive rural district of South Holderness, including Patrington. Both reservoirs are constructed of reinforced concrete.

Sheffield Sewage Disposal Works.*

By JOHN HAWORTH, F.C.S., Manager and Chemist of the Sewage Disposal Department.

The area of the city of Sheffield is 24,886 acres, and the estimated population is 477,228. The present sewage disposal works serve this population, together with that of the outside districts of Blackburn (780 persons), part of Worthy rural district (9,000 persons), and Dore (1,732 persons), the sewage from which is treated under agreements with the city council. The normal dry-weather flow is approximately 15,000,000 gallons per day, of which 3,500,000 gallons consist of trade waste waters, but this volume has been considerably exceeded since the war commenced, owing to munition work.

The whole of the city is drained by gravitation to the main disposal works, situated at Wincobank, with the exception of a small proportion which is dealt with at the Tinsley works, which adjoin the main works.

In the year 1884 works were designed by Mr. G. Alsing, and constructed on part of the present site at a cost of £44,730 (including land) for the purpose of treating the sewage by lime precipitation. These works were opened in 1886, and were designed for a flow of 10,000,000 gallons per day. For some years the sewage was treated during eighteen hours only out of the twenty-four each day, and the sewage was allowed to pass to the river in an untreated condition during the remaining six hours at night. Later the treatment was made continuous.

At the time of their opening the works were considered to be of an excellent type, and they no doubt produced a great improvement on previous conditions. The rapid growth of the city, the population of which increased from 304,720 in 1886 to 352,760 in 1896, and the introduction of the bacteriological systems of treatment, and the demand for treatment of storm water, necessitated further extensions and improvements.

In the year 1900 the corporation obtained powers to purchase further areas of land, and 246 acres in all have been acquired for sewage disposal purposes. A scheme for the extension and remodelling of the works was therefore prepared and carried out by the city engineer (Mr. Charles F. Wike, M.INST.C.E.). The scheme was placed before the Local Government Board in 1904, construction commenced in 1905, and the first section was put into operation in 1909. The scheme was completed in 1914, at a cost of £298,143, including lands actually occupied by the works.

The old works, except the shell of the main building, have practically disappeared. The works now consist of four sets of catchpits, equal in capacity to 1/48th of the dry-weather flow. Two sets are remodelled from the old pits, and are fitted with screens for hand raking, and fixed dredgers for cleansing purposes. The two new catchpits, of modern type, are provided with mechanical screens and an electrically driven travelling dredger for removal of the deposited solids directly into railway wagons.

SETTLING TANKS.

The settling tanks are seventeen in number, with a capacity approximately equal to the dry-weather flow of sewage. They are operated on the continuous flow principle, and have proved efficient in removing the solid matters.

SLUDGE.

The deposited sludge is passed by gravitation to two sludge wells in the main buildings, from which it is pumped by three centrifugal pumps to underdrained drying lagoons, where it is air-dried to a moisture content of 80 to 85 per cent. The sludge is then removed by rail to a tip 6 miles lower down the valley, about 1,200 to 1,500 tons per week being thus disposed of.

CONTACT BEDS.

After leaving the settling tanks the settled sewage is treated on 46 acres of primary contact beds and then discharged to the river. Twenty-nine and a-half acres of the contact beds are divided into ½-acre units.

The medium employed is screened clinker and slag, laid to an average depth of 4 ft. 3 in. in graded layers. The under-drainage, laid on concrete floors, consists of tiles, chiefly of semi-circular section, placed in rows 10 ft. apart.

The remaining 16½ acres of beds are similar in construction to those described, but are divided into approximately 1-acre units, each provided with special outlets, so that they may be used either as ordinary contact beds or as storm filters by streaming the sewage through continuously.

The capacity of the works is 64,500,000 gallons per day, but the main conduits, &c., are constructed for a flow of 110,000,000 gallons per day, extension thus being provided for.

The volume of sewage treated is accurately measured by an installation of four 48-in. Venturi meters.

The main buildings contain boilers, engines, dynamos, catchpits, sludge wells and pumps, valve-rooms and workshops.

The laboratory and offices form separate blocks of buildings.

A scheme for secondary treatment, to consist of percolating filters, with power-driven distributors, humus tanks, and accessories, for the rapid aëration and filtration of the primary effluents, has been prepared. The scheme has been submitted to the Local Government Board, but was postponed during the war.

A scheme for pressing the sludge is also under consideration.

EXPERIMENTAL WORK WITH REFERENCE TO THE PURIFICATION OF SEWAGE BY AERATION, ACTIVATED SLUDGE, &c.

A short description of some experimental work carried on at Sheffield is now presented. Although these experiments are by no means complete, and have been retarded on account of shortage of staff and pressure of work due to the war, the description may be of interest and furnish some matter for useful discussion.

At the period when the main extension scheme was approaching completion it was considered probable that some form of secondary treatment of the primary effluents might be needed.

While the primary effluents are usually incapable of putrefaction, at times colloidal solids separate out on standing, and they are particularly liable to this effect on account of the large volume of trade wastes, containing iron and other metallic salts, hydroxides and mineral acids discharged into the sewers, and present in the sewage at the outfall works. Experiments were therefore commenced about four years ago in order to determine the most suitable and economical methods by which the primary effluents from the contact beds might be rendered at all times satisfactory. An experimental plant was constructed, consisting of tanks, pump, motor, &c., for the purpose of conducting the necessary experiments.

AERATION.

It was found that, on standing in contact with air, opalescent and cloudy effluents became quite clear after about twenty-four hours. Experiments were therefore made in order to bring about, if possible, the rapid deposition of colloidal and other solid matters with subsequent clarification.

These experiments consisted of: (1) Aëration by jets of air; (2) aëration by forcing air through porous substances, such as land tiles and silica bricks; (3) aëration by causing the liquids to fall in sprays; (4) aëration by rapid treatment on percolating filters of varying depths; (5) sand filtration; (6) precipitation by chemicals.

All these methods produced the effects desired to a greater or less extent, but by means of the percolating filter effluents of high purity, clear and free from colloidal matters, were obtained.

Primary effluents have been regularly treated in this manner at the rapid rate of 800 to 900 gallons per day per cubic yard of material with satisfactory results over a period of at least four years.

* Paper read at the Annual Summer Conference of the Association of Managers of Sewage Disposal Works held at Sheffield last Saturday.

The following chemical results may be taken as typical:—

	Parts per 100,000. Liquid treated.	Sprinkler Effluent.
Oxygen absorbed, four hours' test...	2·51	0·68
Nitric nitrogen	—	0·72
Dissolved oxygen test. Oxygen absorbed in five days at 18·3 Cent.	—	0·63
Suspended solids	—	Traces only

The effluent, when diluted with tap-water in the proportion of 4 effluent plus 5 tap-water, and the mixture aerated at 14·5 deg. Cent. (equal to two parts dissolved oxygen per 100,000), and then incubated for five days at 18·3 deg. Cent., invariably absorbed less than 2 parts of oxygen per 100,000, and were therefore well within the Royal Commission standard.

The scheme for secondary treatment referred to in the general description of the disposal works was based upon the results of these experiments. It may, however, be pointed out that while the early experiments which were made by forcing air through porous substances, such as land tiles and silica bricks, did not yield such hopeful results, there was an incentive to continue the experiments, inasmuch as attention had then been drawn to the use of activated sludge in combination with aëration. Consequently it was thought that useful information might be obtained by applying activated sludge to the treatment of primary effluents.

In two of the experimental tanks, fitted with diffusers, sludge was activated by the usual method. In one tank primary effluents and mixtures of these effluents with settled sewage were dealt with, and in the other settled sewage was treated.

The results have proved both interesting and instructive. In the case of the tank treating primary effluents with settled sewage, deposition of colloidal matters is obtained, but, bearing in mind the large volumes of this liquid which can be dealt with on the percolating filter and the greater simplicity of the process, no advantage would be gained by adopting the former.

	Parts per 100,000. Liquid treated.	Effluent.
Oxygen absorbed, four hours' test...	3·47	1·03
Nitric nitrogen	—	0·25
Dissolved oxygen test. Oxygen absorbed in five days at 18·3 Cent.	—	1·31
Suspended solids	—	Traces only.

The effluent, when diluted with tap-water in the proportion of 4 effluent plus 5 tap-water, and the mixture aërated at 14·5 deg. Cent., and then incubated for five days at 18·3 deg. Cent., invariably absorbed less than 2 parts of oxygen per 100,000, and were thus well within the Royal Commission standard.

In the case of the tank treating settled sewage, good results are also obtained.

The effluents are usually, with normal sewages, excellent in character, as the analytical results indicate, and the sludge separates rapidly and distinctly. The alluring prospect of a possibility of purification without filters has led to further investigations.

	Parts per 100,000. Liquid treated.	Effluent.
Oxygen absorbed, four hours' test...	4·67	1·69
Nitric nitrogen		0·40
Dissolved oxygen test. Oxygen absorbed in five days at 18·3 Cent.	—	0·21
Suspended solids	—	Too small to estimate in 250 c.c. of the liquid.

The effluents, when diluted with tap-water in the proportion of 4 effluent to 5 tap-water, and the mixture aerated at 14·5 deg. Cent., and then incubated for five days at 18·3 deg. Cent., with a few exceptions absorbed less than 2 parts of oxygen per 100,000 and were within the Royal Commission standard.

Briefly, the following are the results arrived at:—

(1) Well-clarified effluents are usually obtained which are within the commonly accepted limits of impurity allowable.

(2) It is found that discharges of acid trade wastes, such as occur in the Sheffield sewage, destroy the efficiency of the sludge for a time. On one occasion a particularly strong discharge resulted in the activity being destroyed, and aëration for several weeks was required before clarified effluents could again be obtained. This inhibitory action is more or less pronounced, and consequently great care is necessary to render such abnormal discharges neutral in character, and to equalise their flow so as to render such sewage amenable to purification by this process. A still more important point must be considered—namely, the effects of discharges of trade effluents containing and consisting essentially of chemical solids of heterogeneous composition upon the activated sludge.

(3) The porous tiles became choked after a few months' use, owing to dust and grease in the compressed air, and also by bacterial masses growing through the pores of the tiles. This latter fact has also been proved in connection with the Pasteur-Chamberland porous porcelain tube filter.

(4) Uneven aëration occurs by reason of unequal porosity of the tiles.

(5) Tiles have cracked, with the result that the air escapes at one place, and the tank has had to be stopped for repairs. This unsatisfactory feature in the use of porous tiles requires serious consideration.

These unsatisfactory features lead one to the conclusion that, while sewage may be purified by means of activated sludge, the mode of application leaves room for much investigation and improvement before its practical utility is proved. Experiments have therefore been made in connection with devices for the aëration of liquids without the use of porous media, and in this direction some of the latest experiments will now be described.

During a discussion on this question with Mr. F. Scudder, F.I.C., F.C.S., of Manchester, he described to me a series of experiments on the aëration of crude sewage which were made by him in 1881, in collaboration with the late Dr. Angus Smith, and called my attention to an apparatus designed for the oxidation of oils, &c., devised in the year 1880 by Dr. Storer, and which was used in Angus Smith's experiments. As a result of this, and with the aid of valuable suggestions by Mr. Scudder, apparatus has been constructed which promises satisfactory results, of which several small types may be seen in operation.

The apparatus consists essentially of a narrow cylindrical tube placed vertically and fitted with a central spindle, bearing either an archimedean screw or a series of suitably shaped propeller blades. A number of the blades are within and others projecting below the lower end of the tube. The top of the cylindrical tube is placed at a suitable depth beneath the surface of the liquid to be aërated. On rotating the spindle at a rapid rate the liquid is merely circulated down the cylindrical tube, but on the insertion of a small air pipe within the edge of the cylindrical tube a large volume of air is sucked in and distributed into the liquid at the lower end of the cylinder. The mixed water and air rise up on the outer side of the tube ready to flow in again, and thus the aëration is continuous.

The apparatus is at present experimental in character, but, as a mechanical means for circulating the sludge and at the same time giving abundant aëration, has so far proved to be simple and effective without many of the disadvantages to which aëration by forcing of compressed air through porous slabs, &c., is liable.

It should be observed that two functions are performed by the air in the activated sludge process as now operated—viz., primarily, the supply of oxygen for maintaining the bacteriological and chemical action and efficiency of the sludge; and, secondly, the agitation of the sludge with the liquid.

As only a small proportion of the air is used for oxidation, and the larger proportion for circulation it becomes questionable whether it is economical to use compressed air for purposes of agitation, or if mechanical agitation, which would carry in probably the minimum amount of air necessary, would work as efficiently as the more expensive compressed air plant.

With this aim two further experiments were devised:—

(1) A series of perforated ordinary steam pipes was laid at the bottom of a small tank and connected to the compressed air supply. Over the pipes, approximately 2 ft. of clean clinker or slag, broken into approximately ¾-in. cubes, was laid. The tank was then filled with settled sewage, and air bubbled through for about five hours.

The resulting effluent was found to be clarified, non-putrescible, and in all respects a satisfactory one. A partially septic and black tank liquor treated by this method becomes bright and clear after one hour's aëration, and after four to five hours is amply purified.

One of the tanks has been in daily operation for about nine months, and continues to give good results.

	Parts per 100,000. Liquid treated.	Effluent.
Oxygen absorbed, four hours' test...	4·97	0·92
Nitric nitrogen	—	1·15
Dissolved oxygen test. Oxygen absorbed in five days at 18·3 Cent.	—	1·89
Suspended solids	—	Too small to estimate in 250 c.c. of liquid.

The effluents when diluted with tap-water in the proportion of 4 effluent to 5 tap-water, aërated at 14·5 deg. Cent., and then incubated for five days at 18·3 deg. Cent., with a few exceptions absorbed less than two parts of oxygen per 100,000, thus being within the Royal Commission standard.

(2) The second experiment consisted of a small iron tank having a semi-circular section at the bottom. A shaft was fixed lengthwise through the tank, and to it were attached two hollow paddles of special shape, so arranged that in the lowest position the paddle nearly touches the bottom of the tank and in the upper position it is approximately at the top of the tank. The tank was charged with humus washed from material taken from a contact bed together with sewage, the proportionate volume of humus being 25 per cent of the sewage. When the paddle is rotated the blades leave the liquid at the surface and trap a small volume of air, which is carried into the liquid and discharged therein. Thus the mixture of humus and sewage is kept continuously in motion, and a definite quantity of air is discharged into it by each revolution of the paddle. The paddle is revolved fifteen times per minute.

After several weeks' operation the humus was found to become fully activated, and during the last six months crude sewage has been treated daily with satisfactory results, as the analytical table indicates.

	Parts per 100,000. Liquid treated.	Effluent.
Oxygen absorbed, four hours' test...	4·81	1·17
Nitric nitrogen	—	0·66
Dissolved oxygen test. Oxygen absorbed in five days at 18·3 Cent.	—	0·57
Suspended solids	—	Too small to estimate in 250 c.c. of liquid.

The effluents, when diluted with tap water in the proportion of 4 effluent to 5 tap water, aërated at 14·5 deg. Cent., and then incubated for five days at 18·3 deg. Cent., invariably absorbed less than 2 parts of oxygen per 100,000, thus being within the Royal Commission standard.

The results of these two experiments show that the aëration by minute bubbles of air, such as through porous tiles, is unnecessary, and that mechanical circulation, combined with minimum aëration, is efficient. Both these experiments are still in operation.

GENERAL CONCLUSIONS.

The general conclusions drawn from the experiments which have been described may be summarised thus:—

(1) That a normal sewage may be purified by the activated sludge process.

(2) That trade wastes may interfere seriously with the process.

(3) That further investigation is needed with respect to modes of application of the sludge to the sewage, periodical removal of the surplus sludge and the effect of such removal on the continuing results of purification methods of aëration, costs of plant and upkeep, before older plants and methods can be abandoned.

(4) That skilled control of the process will be essential.

(5) That, while the resulting sludge is undoubtedly richer in nitrogenous organic matter than ordinary sewage sludge, it remains to be proved by actual agricultural trials that such nitrogen is in a form suitable for the ready assimilation by plant life, and that as a fertiliser its superiority over humus can be established, as up to the present humus sludge derived from sprinkler filters, which is also richer in nitrogenous organic matter than ordinary sewage sludge, has not been appreciated by the agriculturist as a fertiliser, in spite of its availability in large quantities at many sewage works in this country during recent years.

PERSONAL.

Mr. A. Garrett has been appointed surveyor and inspector to the Drayton (Salop) Rural District Council during the absence of Mr. W. Cotterill with the Forces.

Mr. G. Frier, sanitary inspector, will carry on the duties of Mr. E. C. Moorhouse, surveyor to the Melton Mowbray Rural District Council, during his absence on active service.

Mr. J. Worsfold, sewage works manager to the Hungerford Rural District Council, has been appointed to a similar position under the East Barnet Valley Urban District Council.

Mr. P. G. Killick, borough surveyor of Finsbury, has had a son wounded in the recent fighting on the western front. At the meeting recently of the borough council the Mayor (Alderman Henry B. Barton, J.P.) expressed the sympathy of the members with Mr. Killick.

Mr. W. H. Hill, chief assistant borough engineer and surveyor of Kensington, who has been carrying on the duties of borough engineer since the resignation of Mr. A. R. Finch, has, pending the filling of the vacancy, been appointed acting borough engineer and surveyor, at an additional salary of £120 a year, with an honorarium of £50 for extra services during Mr. Finch's absence on sick leave.

Mr. Greville H. Montgomery, so well known to our readers for his success in raising the Building Trades Exhibition to an institution of international value and interest, is to be congratulated on being alive and in his usual vigorous health, notwithstanding persistent rumours to the contrary. Sympathetic enquiries at his office on Wednesday were answered by Mr. Montgomery in person, who considers the rumours are exaggerated.

Mr. F. P. Dolamore, who, as stated last week, has been appointed borough engineer of Bournemouth, has been in the service of the town council for twenty-five years, having been originally appointed engineering assistant. Previously he had been chief assistant to Sir James Lemon at Southampton. His promotion to deputy borough engineer of Bournemouth took place nineteen years ago, and in this office, under the late Mr. F. W. Lacey, he was responsible for carrying out many important municipal schemes, including remodelling the main drainage, construction of a tramway system with necessary street widenings, construction of Meyrick and Queen's golf links and parks, and the construction of the Undercliff drives and paths.

Sheffield University last year gave a First Class B.A. degree to Miss C. W. MacBrair, elder daughter of Mr. and Mrs. W. M. MacBrair, of Sheffield, and niece of Mr. R. A. MacBrair, city engineer and surveyor of Lincoln; recently, as the result of a final examination, they have granted the M.A. degree.

OBITUARY.

Mr. John Allan, road surveyor to the Huntley District Committee of the Aberdeenshire County Council, died recently, we regret to state.

Electric Lighting Charges at St. Helens.—An increase of 10 per cent in the price of electric current was agreed to at a meeting of the St. Helens Corporation last week. Alderman Sir Joseph Beecham, in moving the adoption of the minutes of the Electricity Committee, stated that ten years ago they reduced the price to 3½d. per unit, and charged nothing for meter rents, and for towns of the character of St. Helens that was about the lowest charge in the country. There were only about 5 per cent of the municipal undertakings of the country that did not charge meter rents. When they reduced the price to 3½d. the committee only paid 6s. a ton for coal. Coal had gone up in price, and no alteration was made until a few months ago they put 10 per cent both for power and lighting. The average price two or three months ago was 16s. or 17s., and they were now paying 21s. or 21s. 6d. When they took into consideration the inferior quality of the fuel supplied, it meant an increase of 300 per cent in the price of fuel. Against this the increase of the price was 20 per cent. That would make the charge just under 4½d. per unit. He quoted figures to show that this was below the charge in most other places.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars have reached us during the present week. Other reports will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Accrington T.C.—It has been decided to enlarge the tramway offices at the market.

Grantham T.C.—It has been agreed to provide stabling for seven horses, and also cart sheds, at a cost approximately of £800.

South Shields T.C.—It is proposed to build an infectious diseases hospital near Cleadon from plans prepared by the borough engineer, Mr. L. Roseveare, but the scheme will not take effect till after the war.

HOUSING AND TOWN PLANNING.

Birmingham T.C.—At the meeting of the city council last week authority was given to prepare an amending scheme in respect of an area of about 247 acres included in the East Birmingham town-planning scheme. It was explained that the authority was necessary to alter the planning of three roads to make them conform with the continuations of those roads coming within the North Yardley scheme.

Leeds T.C.—In moving the adoption of the minutes of the Improvements Committee, Alderman F. M. Lupton (chairman) called special attention to the resolution authorising the city engineer, Mr. W. T. Lancashire, to prepare plans for a Moortown town-planning scheme. Part of the scheme, he said, included part of Alwoodley, which was within the Wharfedale Rural District Council's area. The chief reason for that was that the projected ring road round the city would almost necessarily pass through part of that area.

Worcester T.C.—A report is to be prepared upon the advisability of a town-planning scheme for the Blackpole district.

MOTOR TRANSPORT.

Finsbury B.C.—The borough council recently authorised the purchase of a motor road sweeper at £675.

Friern Barnet U.D.C.—A committee is to consider and report upon the provision of a motor fire engine.

Manchester T.C.—The substitution of motor-'buses for tramcars in certain districts is being considered by the city council.

REFUSE COLLECTION AND DISPOSAL.

Southall-Norwood U.D.C.—The Local Government Board have been asked to consider favourably a proposal by the council to spend money on the provision of a refuse destructor or other means for the disposal of refuse.

Surbiton U.D.C.—It has been referred to a committee to consider whether the removal of house refuse in the district could not be carried out cheaper by the council itself, by direct labour, with its own horses and mechanically propelled vehicles. Consideration is also to be given to the collection and sale of waste paper.

Tilbury U.D.C.—The surveyor, Mr. S. A. Hill-Willis, has received instructions to prepare a specification for the proposed refuse destructor.

ROADS AND MATERIALS.

Barrow T.C.—The town council have accepted the tender of Highways Construction, Limited, at £670, for repairing a length of Abbey road with Mexphalte, the company to guarantee the work for five years.

Denbigh C.C.—It was reported that the Road Board had allotted £1,000 to the council for road improvement purposes, it being intimated that the grant would be increased if it was necessary in the national interests.

Derbyshire C.C.—The estimate for the surface tarring of the roads is £9,675, and it was stated at the council meeting recently that the Road Board would be prepared to pay a moiety of this.

Dover T.C.—At the last meeting objection was raised by councillors to the use of clinker ash on tar-painted roads. Councillor Walmisley said it was a very unsatisfactory material to use. Speaking as an engineer, he thought there was nothing like sand and broken stone or metal for the purpose. If they used clinker ash and had fine weather, it was soon ground down to a fine powder, and flew about and got down people's throats, and if it happened to be wet, it was soon converted into a thick and unpleasant mud, which was very unsatisfactory.—The Mayor said that the deputy engineer, Mr. Crummack, would say that he was of the councillor's opinion; but, unfortunately, he was not able to get the other material.—Councillor Gatehouse asked why they could not get Thames ballast, which was better than cinder.—Alderman Lewis thought they could use Broadstairs sand.

Essex C.C.—It has been agreed to resurface with Tarmac part of the Barking to Southend main road, at an estimated cost of £4,000.- Application is being made to the Road Board for a grant of £3,000 for road tarring.

Ilford U.D.C.—The tender of Messrs. Parsons & Parsons, at £369, has been accepted for making up the right of way at the rear of the town hall.

Kidsgrove U.D.C.—An estimate of £400 has been passed for road improvements in Kidsgrove Ward.

Market Drayton U.D.C.—The Highways Committee have been asked to report upon a proposal for a street improvement at the junction of Shropshire-street and Cheshire-street. The scheme involves the acquisition of certain properties, and the approximate cost is £300.

Norfolk C.C.—The county surveyor, Mr. W. H. Gladwell, reported to the Eastern Highways Committee that he had received a communication from the surveyor to the Cromer Urban District Council stating that his Highways Committee were prepared to carry out the necessary tarring to maintain the roads in their present condition on the understanding that the county council would pay the whole of the cost. It was stated that if the matter was delayed until the autumn granite would be required. Tarring in the district cost about 1d. per yard; one or two roads were wearing out, and unless done now would cost 1s. 2d. per yard for granite in the autumn. After discussing the matter the committee decided not to depart from their rule, viz., to pay one fourth of the cost of the tarring by the urban authority.

Pickering R.D.C.—No objection has been offered to the proposal of the county council to the tar-spraying of the Whitby-road. The cost would, it was stated, be borne by the Government.

Swansea T.C. — The Highways Committee have approved the scheme of the borough surveyor, Mr. J. R. Heath, for a new 60-ft. line of frontage for Park Wern-road to Gnoll-avenue. With respect to the powers over new omnibus routes in the Local Government Emergency Provisions Act, the borough surveyor said he thought the town clerk should make a report, as the Act was very loosely worded. The mayor said owing to the different interpretations capable the Act should be boiled up and rehashed, for no one understood its meaning. The borough surveyor said the intention could have been put plainly in a few words. The matter was left to the town clerk.

SEWERAGE AND SEWAGE DISPOSAL.

Alford U.D.C.—The Sanitary Committee have been authorised to purchase two 5-in. pumps at a cost of about £60.

Chertsey U.D.C.—With respect to the proposed sewage disposal scheme an intimation has been received from the Local Government Board that a loan cannot be sanctioned for the purpose until after the war.

Croydon T.C.—It has been agreed to effect alterations and extensions at the South Norwood sewage farm at an estimated cost of £1,500.

Grimsby R.D.C.—A committee has been authorised to consider the advisability of a surface water drainage scheme for Immingham.

Langholm T.C.—It is understood that an agreement has been reached by which the town council are to carry out a sewage purification scheme. The immediate execution of the work is contingent upon a satisfactory contribution towards the cost being obtained from the Ministry of Munitions.

Leyton U.D.C.—Mr. A. P. I. Cotterill, M.INST.C.E., has prepared for the council a report on sewage disposal, in which he states that of all the alternatives to chemical precipitation that of activated sludge treatment holds out the greatest possibilities. It is the natural development of methods, aiming at the intensive cultivation of bacteria upon which experts have been working for many months. He then commends the council to set aside a sum for rearranging a portion of one of the existing tanks to treat at least 20,000 gallons per day, and to commence a series of experiments. With reference to this proposal, the surveyor, Mr. E. H. Essex, has been instructed to obtain further detailed information from Manchester, Salford, Stamford, and Worcester for submission to the Public Health Committee and if deemed desirable to visit one or more of the places mentioned to inspect the actual operations and report.

Martley R.D.C.—A report was received from the engineers of the Hallow sewerage scheme with reference to an obstruction in the sewers. The engineers said that the trouble was not due to any defect in the sewer, but to a jelly-like scum which was in evidence, particularly at one manhole. It was a most unusual circumstance, and one which was very rare in their experience. The best remedy was flushing, and they suggested that special valves, the better to carry out this method, should be installed.—Mr. Lord agreed that it was an extraordinary circumstance. There was a splendid fall.—The inspector was instructed to procure the valves.

Tiverton R.D.C.—An expenditure of £100 has been approved for road drainage at Cruwys Morchard.

Wolverhampton T.C.—The Sewerage Committee report a profit of £2,588 on the year's farming operations at Barnhurst, compared with £2,592 for the previous year.

WATER, GAS, AND ELECTRICITY.

Batley T.C.—The Treasury are being asked to sanction a loan for the provision of new carbonising plant at the gasworks.

Bristol T.C.—The Electrical Committee in April, 1915, received authority from the council to spend nearly £27,000 on a 6,000-kw. turbo alternator, but when the committee went to the Local Government Board for sanction to raise the money the board suggested that they might manage with a machine of half the capacity, and said they would allow a loan of £16,500. The committee "have reluctantly adopted the suggestion," and have accepted a tender from Messrs. Fraser & Chalmers, of Erith, for the provision of a 3,000-kw. Fraser & Chalmers turbine, coupled to a Vickers alternator, and with condensing plant by the British Westinghouse Company, at the inclusive sum of £11,608.

Burnley T.C.—The Local Government Board have sanctioned the proposed work in connection with the Hurstwood reservoir. The estimated cost is £32,000.

Cork T.C.—A letter has been received from the Cork Gas Company regretting that, owing to the great increase in the price of coal and freight, they are compelled to increase the charges for gas consumed in metered lamps by 6d. per 1,000 cub. ft., for gas consumed in unmetered lamps by 7s. 6d. per lamp per annum, and for gas used for buildings and offices by 6d. per 1,000 cub. ft., the increased charges to take effect from July 1st. The Public Works Committee have agreed to send a letter protesting against the proposed increases.

Dawlish U.D.C.—It was reported that the electric light company had declined the council's alternative offer to pay at the rate of 3¼ per cent per annum on their capital outlay in respect of street lighting, in lieu of the 5 per cent as required by the company. The company, however, made the following offer, without prejudice to their rights under the contract, to hold good generally during the period of restricted lighting and the operation of the Summer-time Act: Contract prices for all lamps lighted; £1 15s. per annum per 200-c.p. lamp unlit; 17s. 6d. per 100-c.p. lamp unlit; and 8s. 9d. per 50-c.p. lamp unlit. The council have agreed to these terms.

Edinburgh T.C.—The Electric Lighting Committee report that the deficiency on the account last year was £8,075.

Exeter T.C.—New electric pumping apparatus, capable of delivering 25,000 gallons per hour, has been installed at the corporation waterworks as part of the scheme of extension planned by the city surveyor, Mr. T. Moulding. The new plant assures the city of a continuous and ample supply of water under any conceivable circumstances.

Glasgow T.C.—The great demand which the manufacture of war material has caused for electricity for power and lighting, especially the former, is demonstrated by the fact that the revenue of the corporation electricity department for the financial year which ended on May 31st was £530,720, as compared with £405,372 in the preceding year. This is an increase of £125,348, while in comparison with the revenue of the year 1913-14, which was £378,315, there is an increase of £152,405.

Leyland U.D.C.—It is proposed to ask the Local Government Board to sanction a scheme for additional mains for the extension of the water supply.

Lynton U.D.C.—The surveyor, Mr. W. Yeo, has been authorised to sink a well near the isolation hospital.

North Berwick T.C.—It has been decided to increase the price of gas from 4s. 7d. to 5s. per 1,000 cubic feet.

Nottingham T.C.—The Water Committee report that the water undertaking had been carried on without additional capital obligation. In twelve months' time the city would have a full supply from the Derwent Valley, and distribution would be such that it would be impossible to differentiate the water from the sparkling type which they had enjoyed for generations past.

Startforth R.D.C.—A scheme has been approved for the improvement of the Bowes water supply.

Tipton U.D.C.—A scheme has been adopted for the reconstruction of four beds of retorts at the gasworks on the horizontal system, at an estimated cost of £2,000.

Tunbridge Wells T.C.—The nett profit on the electricity undertaking last year was £598.

Walsall T.C.—The report of the gas undertaking for last financial year shows a nett profit of £7,560.

Woolwich B.C.—A boiler, superheater, and economiser are to be provided for the Globe-lane station, and, subject to the sanction of the Local Government Board, it is proposed to extend the electricity mains at a cost of £600.

MISCELLANEOUS.

Bristol T.C.—With respect to a suggestion that two or three members of the Sanitary Committee should attend the Cardiff meeting of the Institute of Cleansing Superintendents, the chairman of the committee said it was important that they should see the motor appliances to be on view there, because the committee were now paying at the rate of £2,000 a month for haulage. The city engineer, Mr. L. S. McKenzie, had suggested to the manufacturers what was likely to be suitable for Bristol, and they had promised to exhibit it. The committee agreed to send a few members experienced in the haulage problem to see the show.

Croydon T.C.—A swimming bath is being used for the storage of furniture of men called up.

Sheffield T.C.—A gross profit of £173,459 was made on the corporation tramways last year. The total income of £455,608 was a record figure, and the nett profit of £95,779 an increase over that of the preceding year of £25,840.

Teignmouth U.D.C.—In regard to the adjustment of accounts as between the highway and gas departments, in consequence of the public lighting being dispensed with, the surveyor, Mr. F. W. Knight, reported that he and the gas manager thought it fair that £390, including the current amount estimated for lighting, should be divided thus—gas department £190, general district fund £200.

FOR OTHER ADVERTISEMENTS
See End of Paper.

WANTED, Clerk of Works (between 41 and 50), with special experience of sanitary plumbing, drainage, and heating, to adapt a large country house for military purposes. Apply to Willcox & Raikes, Consulting Engineers, 63 Temple-row, Birmingham, stating whether married or single and when disengaged, also age and salary required, with particulars of experience and references. (3,046)

WANTED, a Good Second-hand Ten-ton Steam Roller, with Scarifier attached. Price and particulars to F. Hargreaves, Surveyor, Consett, Co. Durham. (3,047)

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Is it not rather to be regretted that only five out of twelve papers came under discussion at the annual meeting of the Institution of Municipal and County Engineers at Blackpool? Is it not a pity that the "menu" of papers to be read was so large that only the *hors d'œuvres* could be taken, and that many who had come to read, or discuss, other papers than those on town planning, &c., had to go empty away? What must be the feelings of the members who had taken the trouble to write these papers?

* * * *

Was not Lord Crewe's recent pronouncement at the Imperial College of Science and Technology of great importance in connection with the future teaching of science in our national system of education? Is it not well that the Government have appointed a Special Committee to inquire into the position of natural science as regards education, with a view to the promotion of the advancement of pure science in our schools and colleges, and is it not to be hoped that this Committee will be able to change our present "classical" system of education to one of a more practical and useful description?

* * * *

Is not the position of the surveyor with regard to the men under him beginning to reach a very dangerous state in some districts? Is it a fact that at a meeting of the Shildon, Durham, Urban District Council recently the question of the dismissal by the surveyor of a workman was referred to a sub-committee, after a full explanation by the surveyor, and after his action in the matter had been approved by the General Purposes Committee? If this interference with the power of the surveyor is to continue, will not the result end in chaos of the worst description, and will not all discipline disappear? What sort of a position can a surveyor hold if he is not to be responsible for his workmen, and councils are to take this responsibility out of his hands? Where is Democracy drifting?

* * * *

Is not Alderman Davies, of the Swansea Town Council, to be congratulated on his suggestion that the spare land at the corporation cemetery should be used as a model kitchen garden where ratepayers could obtain advice from a practical gardener as to the best method of utilising their own gardens for the production of vegetables and fruit? Do we not all heartily wish Alderman Davies every success in carrying out his excellent and patriotic suggestion?

* * * *

Is it not satisfactory to find that there was a general consensus of opinion in the discussions on the papers on town planning at the recent annual meeting at Blackpool that the roads, sewers, and general planning was the work of the surveyor, and that the design and erection of the buildings and the general beautification of the scheme should be the work of the architect? Does not this go a long way towards settling the vexed question as to who should prepare and carry out a town planning scheme?

* * * *

Is not the Mayor of Stockton-on-Tees to be congratulated on his patriotic action in refusing a proposal of his council to appeal on his behalf for his exemption from military service until the end of his year of office, he having attested under Lord Derby's scheme? Is not his example one that could be followed with advantage by a large number of men who use every endeavour to escape national service?

* * * *

Is it not a "feather in the cap" of the activated sludge process that the Worcester Corporation, who have experienced endless trouble with their sewage disposal works, should have decided to adopt this process, after a long and exhaustive trial of a small installation at their works?

* * * *

Will not the great rise in the price of petrol affect the profits of the motor-'bus companies, and if it continues give an impetus to the electric overhead-wire system with railless cars? Was not the experience of the Keighley, Yorks, Corporation confirmatory of this when they abandoned their motor 'buses and introduced the railless system, thus converting an annual loss into a considerable annual profit?

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

DRAUGHTSMAN. July 17th. Southampton County Council. £130 per annum. County Surveyor, The Castle, Winchester.

ASSISTANTS (two).—July 24th.—West Suffolk County Council.—Mr. W. Lionel Jenkins, county surveyor, Shire Hall, Bury St. Edmunds.

CITY SURVEYOR'S TEMPORARY ASSISTANT. —July 24th.—Corporation of Salisbury. £104 per annum.—Mr. Francis Hodding, town clerk, Municipal Offices, Salisbury.

ENGINEER AND MANAGER.—July 24th.—Loughborough Electricity Committee. £300 per annum.—Mr. H. Perkins, town clerk, Town Hall, Loughborough.

DRAUGHTSMEN For war work in a Government aëronautical office in London. — £3 10s. to £1 1s. per week, plus overtime.—Room 344, Adastral House, Victoria-embankment, E.C.

WATERWORKS FITTER.—Cirencester Urban District Council.—Mr. T. Hibbert, surveyor, Cirencester.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Buildings.

DUNDEE.—July 17th.—For the execution of jointless flooring and painter's work, for the corporation. —Mr. H. Richardson, Electricity Department, Dundee.

DUNDEE.—July 17th.—For the execution of reinforced-concrete foundation, mason, and other works, for the corporation.—Mr. H. Richardson, Electricity Department, Dundee.

EDINBURGH.—July 17th.—For repairs to the electric generating station, for the corporation. Mr. J. A. Williamson, architect, Public Works Office, City Chambers.

HALIFAX.—July 17th.—For additions to the tramway depot, for the Tramways Committee.—Mr. J. Lord, borough engineer, Town Hall.

HALIFAX. — July 17th. — For rebuilding greenhouses, for the Parks Committee.—Mr. J. Lord, borough engineer, Town Hall.

SURBITON.—August 4th.—For repairs and painting at the cottage and buildings in Red Lion-road, for the urban district council.—Mr. F. W. Wood, clerk, Council Offices, Ewell-road, Surbiton.

Engineering: Iron and Steel.

CLACKMANNAN.—July 17th.—For the supply of 200 tons of cast iron pipes and special castings, for the county council. Messrs. Leslie & Reid, engineers, 72A George-street, Edinburgh.

ROTHES.—July 19th.—For the concrete and iron work of a culvert, for the town council. Mr. A. Robb, burgh surveyor.

PLYMOUTH. July 20th.—For the supply of a rotary steam boiler-fed pump, for the corporation.—Mr. E. G. Okell, borough electrical engineer.

RUNCORN.—July 22nd.—For supplying and fixing a 20-ton weighbridge, for the urban district council.—The Clerk, Town Hall.

ENFIELD.—July 26th.—For the erection of new cast-iron hot-water mains and for repairs, for the guardians.—Mr. J. C. S. Mummery, architect, 13 Fitzroy-square, W.

HALIFAX. August 5th.—For the reconstruction in reinforced concrete of Clark Bridge, for the corporation.—Mr. J. Lord, borough engineer, Town Hall.

SINGAPORE.—August 14th.—For the construction of a steel bridge, for the Public Works Department.—Chief Clerk, Colonial Engineer's Office, Singapore.

Roads.

HALIFAX. July 17th.—For the execution of improvement works in Duke-street, for the Highways Committee. Mr. J. Lord, borough engineer, Town Hall.

WELLINGTON. July 19th. For the supply of 800 tons of broken granite, for the urban district council. —Mr. G. Riley, surveyor, 14 Walker-street, Wellington.

BUNGAY. July 19th. For the supply of 1½-in. Mountsorrel granite, for the urban district council. Mr. H. Earl, surveyor.

HEBBURN.—July 22nd.—For works of improvement, for the urban district council. Deputy Surveyor, Council Offices, Argyle-street, Hebburn.

BROADSTAIRS.—July 31st.—For the supply of 500 cub. yds. of pit flints and 160 cub. yds. of pit gravel, for the urban district council.—Mr. H. Hurd, surveyor.

JOHANNESBURG.—August 14th-15th.—For the supply of 1,600 tons of tar or tar substitute, for the municipal council.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, E.C.

Sanitary.

RHONDDA.—July 17th.—For scavenging the district in sections, for the urban district council.—Mr. E. H. Barber, engineer and surveyor, Council Offices, Pentre, Rhondda.

OULTON BROAD.—July 22nd.—For the removal of house refuse and cleansing cesspools, for the urban district council.—Mr. E. G. Rand, deputy clerk, Victoria Chambers, Lowestoft.

TADCASTER.—July 28th.—For emptying ashpits, for the rural district council.—Mr. H. C. Wood, sanitary inspector, Tadcaster.

Stores.

WHITEHAVEN.—July 17th.—For the supply of stores, for the Harbour Commissioners.—Mr. J. Tyson, clerk, Harbour Office, Queen's Dock Quay, Whitehaven.

SALFORD.—For the supply of general stores, for the gas department.—Mr. W. W. Woodward, engineer, Gas Offices, Bloom-street, Salford.

Miscellaneous.

EALING.—July 17th.—For the supply of household coal and coke, for the town council.—Mr. W. R. Hicks, borough surveyor, Town Hall, Ealing.

EALING.—July 17th.—For the supply of disinfectants, for the town council.—Mr. W. R. Hicks, borough surveyor, Town Hall, Ealing.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President Mr. John S. Brodie, M.Inst.C.E., Borough Engineer and Surveyor, Blackpool.

SOUTH-WESTERN DISTRICT MEETING.

A South-Western District meeting of the Institution of Municipal and County Engineers is to be held at Exmouth on Saturday, July 29th.

Programme.

3.0 p.m.—Meet at council offices, where Mr. County Councillor Crews, chairman Roads Committee, Exmouth Urban District Council, will receive the members.

Read minutes of previous meeting.

3.15 p.m.—Proceed to the Marine Drive Works for inspection, where Mr. Hutton will describe the works. The works comprise: Just completed, approximately ¼ mile of bulk concrete sea-wall, built by Lord Clinton (Engineers, Messrs. Douglass, Lewis and Douglass); approximately ½ mile of reinforced concrete and masonry sea-wall, built by the Exmouth Council (Engineer, Mr. S. Hutton).

In connection with the above and now in course of construction by the Exmouth Council: Approximately 1 mile of reinforced concrete carriageway, 40 ft. wide, with 25-ft. of footpaths (Engineer, Mr. S. Hutton).

Arrangements are being made with the contractors to keep the men working during the inspection.

5.0 p.m.—Tea at the Undercliff Tennis Pavilion (adjoining the works) by invitation of Mr. Crews and Mr. Hutton; after which Mr. Hutton will be glad to answer any questions arising out of the inspection.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.

NORTHFLEET. Accepted for the supply of broken ragstone, sand and gravel, hire of steam roller and horses and carts, and the supply of 16,650 gallons of tar, for the urban district council. Mr. J. A. Mitchell, surveyor:

Sand.—J. F. Martin, Greenhithe, 1s. 11d. per yard.
Gravel.—J. F. Martin, Greenhithe, 1s. 4d. per yard.
Tar.—E. G. Holmes & Co., Northfleet, 33d., 33d., and 32d. per gallon.
Steam Roller.—T. Wood & Sons, Limited, Crockenhill, 27s. per day.
Scarifying.—T. Wood & Sons, Limited, Crockenhill, 5s. 6d. per cubic square yard.
Ragstone.—W. H. Bensted & Son, Maidstone, 9s. to 9s. 6d. per yard.
Pit Flints.—J. & B. Martin, Limited, Pinden, 4s. per yard.
Granite.—L. Summerfield, Limited, Kensington, 16s. 8d. per ton.
Horse Hire.—C. Dyke, Northfleet, 13s. per day.

Bexhill's New Isolation Hospital.—A new infectious diseases hospital has recently been completed for the borough of Bexhill. The observation pavilion contains accommodation wards for two males and two females, together with duty room and spacious verandah. A small laundry has been erected adjoining the existing kitchen. The buildings are of brick with rough-cast and local red-brick dressings, plinths and sills, and have slated roofs with red roll ridging. The floors consist of polished pitch-pine blocks in concrete. The heating is by open fireplaces, and the lighting by gas with incandescent inverted burners. The wards are ventilated by means of inlet ventilators at the floor-level under each bed. The whole of the work has been designed and carried out under the supervision of the borough surveyor (Mr. George Ball, Assoc.M.Inst.C.E.). The accounts for the works have not yet been settled, but it is anticipated that the cost of the works carried out, including furnishing, will not exceed £1,150.

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

JULY.

17-20. Institute of Cleansing Superintendents: Annual Conference at Cardiff.
29. Institution of Municipal and County Engineers: South-Western District Meeting at Exmouth.

APPOINTMENTS OPEN.

WANTED, two or three Working Foremen, used to Tar-spraying and the Laying of Tarmacadam Roads, Footpaths, Playgrounds, &c. Give full particulars and experience and wages required. Must be ineligible for Military Service. Apply Box B., W. H. Smith & Son, Lichfield-street, Wolverhampton. (3,041)

CIRENCESTER URBAN DISTRICT COUNCIL.

WATERWORKS FITTER.

Immediate applications are invited for appointment named above from persons capable to superintend works under the directions of the Surveyor to the Council. A practical knowledge of public supply of water derived from boreholes, and the engines and pumping plant (including experience with suction gas) used for raising the supply is essential; also experience in repairing pumping plant.

Applicants must also be experienced in distribution of supply, including waste and other meters, Venturi meter, electrical water-level recording apparatus for reservoir, the laying of mains and services, fixing of hydrants, sluice valves, &c.

Applicants must be absolutely ineligible for, or totally exempt from, Military Service; they must state age, qualifications, whether married or single, present and previous employment, wages required, and enclose copies of three testimonials addressed to Mr. T. Hibbert, Surveyor, Cirencester. (3,042)

Works: STRANTON WORKS, WEST HARTLEPOOL.

CITY OF SALISBURY.
CITY SURVEYOR'S TEMPORARY ASSISTANT.

The Town Council invite applications from men ineligible for Military Service for the appointment of a Temporary Assistant in the Office of their City Engineer and Surveyor in consequence of the absence of the present Assistant on Active Service.

Applicants must have had experience in a municipal engineer's office.

The appointment to be determinable by a month's notice.

Applications, in candidate's own handwriting, stating age, experience, salary required (the salary previously paid to the Temporary Assistant being at the rate of £104 per annum), when able to commence duties, and accompanied by copies of not more than three recent testimonials, endorsed "City Surveyor's Assistant," must reach me not later than noon on Monday, the 24th instant.

Canvassing is strictly prohibited.

FRANCIS HODDING,
Town Clerk.

Municipal Offices,
Salisbury.
July 6, 1916. (3,043)

WEST SUFFOLK COUNTY COUNCIL.
COUNTY SURVEYOR'S DEPARTMENT.

Two Assistants required temporarily to fill places of those released for Military Service. One Assistant will be engaged chiefly on accounts, the other on correspondence. Applicants must have had experience in a Surveyor's Office.

Applications, in the candidate's own handwriting, stating experience, qualifications, age, salary required, and when able to take up duties, with copies of three recent testimonials, to be received by the undersigned not later than 24th July, 1916.

W. LIONEL JENKINS, ASSOC.M.INST.C.E.,
County Surveyor.

Shire Hall,
Bury St. Edmunds.
July 12, 1916. (3,045)

APPOINTMENTS WANTED.

DEMONSTRATOR.—Lady, experienced (Naval Officer's daughter), requires permanent position; gas, electric light, domestic patents, or similar.—Reply, stating remuneration offered and full particulars, Box 1,576, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (3,044)

EXPERIENCED Surveyor desires appointment in Mining Engineer's Office with a view to working partnership. Highest testimonials. Terms and fullest particulars to Box 1,574, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (3,032)

MUNICIPAL Surveyor's Chief Assistant desires appointment, temporary or otherwise. All-round experience sewerage, sewage disposal, surveying, levelling and water supply. Age 24, with military discharge. Excellent references.—Box 1,575, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (3,036)

PREPARATION FOR EXAMINATIONS.

CORRESPONDENCE COURSES for A.M.I.C.E., STUD.I.C.E., MUNICIPAL AND COUNTY, SANITARY SCIENCE AND SANITARY INSPECTORS, P.A.S.I. and F.S.I. Exams., by a Surveyor, who is F.S.I., A.M.I.C.E. and GRAD.M. and Co.E., all by Exam., with 23 years' municipal and 13 lecturing and coaching experience, assisted by D.Sc.(LOND.), M.A.(CAMB.), with high mathematical honours. Record for past 3 years, all Exams., 90 per cent p. Exceptionally low fees; easy payments.—For further details and testimonials apply Box 892, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

Minutes of Proceedings.

Arterial Roads in Greater London.

At the last meeting of the London County Council an important report was presented by the Improvements Committee in which it was pointed out that the Prime Minister and the President of the Local Government Board have been asked to receive at the end of the present month a deputation in support of the resolutions passed at the second main conference on arterial roads in Greater London. Our readers are already familiar with the terms of those resolutions, which generally seek official recognition for the findings of the conference as to suitable routes. The county council have a general interest in the matter as being the central authority for the planning and execution of street improvements in London. In the past their general policy with regard to road improvements has been necessarily in the direction of improving existing means of communication as and when favourable opportunities have occurred, and the main consideration with them has always been—and very properly so—the degree of benefits to be conferred by any improvement on the general through traffic of London, due regard being paid to the need for improving main roads leading out of London into adjacent districts. The present report does not deal in detail with the proposals of the conferences in regard to new roads within the county of London. It is pointed out, however, that the formal presentation of the recommendations of the conferences to the Prime Minister and the President of the Local Government Board may be regarded as involving some measure of acquiescence on the part of all the authorities represented at the conferences. So far as the council is concerned, in the absence of an expression of its views, it might be considered that the council had withdrawn from the position it took up with the Road Board on the subject of road improvements, and had accepted the conclusions of these conferences as constituting a programme having prior claim on its attention in connection with road improvement and development in London. In order to safeguard the council's position, both for preserving freedom of action for the future and also for maintaining a claim on any Government fund for aid towards the cost of urgently needed London improvements, the Committee consider that the views of the council should be made known to the Prime Minister and to the President of the Local Government Board, if possible before the deputation above referred to is received. The recommendation of the Committee is in the following terms: That, in connection with the proceedings of the conferences on arterial roads in Greater London, the council, while in general agreement with the principle of a far-sighted policy of reservation of routes before land is built on or values enhanced, reserves its opinion as to the best methods for determining routes for arterial roads, and the actual routes for such roads, particularly in the County of London, where conditions are essentially different, as regards road planning, from those obtaining in neighbouring counties, and also reserves its opinions as to the relative importance and urgency of the proposed arterial roads within the County of London in comparison with other road improvement proposals affecting the county; and confirms the views expressed by it to the Road Board on the subject of London improvements and of grants in aid of such improvements from new sources of revenue.

No one will criticise this recommendation on the ground of want of caution. It seems to us, however, to be rather late in the day for a great body like the London County Council to be "reserving its opinion as to the best methods for determining routes for arterial roads." The report of the Committee is very frank as to the reasons for the recommendation. If the schemes for arterial roads are proceeded with, it is said that the council will probably be expected to contribute, and in view of the probable heavy cost involved the council's co-operation as one of a number of authorities in the execution of the schemes might involve the abandonment or postponement of improvements regarded by the council as of greater urgency and necessity from the standpoint of the requirements of the traffic of London. If the State, by assuming control of the preparation and determination of arterial road schemes, is also prepared to accept the financial responsibility for the whole or greater part of the expenditure, whether on capital or maintenance, there would be the danger that any money which the Government may be prepared to allocate in the future for the improvement of roads and road communication may be devoted towards the construction of the arterial roads recommended by the conferences, with the probable consequence that no new source of revenue will be available for the execution of the improvements to which the council would attach greater importance. If, even without assuming financial responsibility for the whole or greater part of the expenditure, a Government department approves and fosters the arterial road proposals of the conferences, the council might be seriously prejudiced in its applications to Parliament for sanction to improvement schemes in London, as it has been the practice in recent years for Government departments, including the Local Government Board, to present to Committees of Parliament reports upon Bills without supporting such reports by evidence which can be cross-examined. The County Council are perfectly right in repre-

senting their views in the highest quarters, and even though we may not agree with everything in the report, we commend the frankness which has led the committee to state so fairly the reasons which have led them to the conclusion at which they have arrived.

* * *

Economic Town Planning.

Mr. Ross Young's recent paper on the "Fundamental and Economic Considerations in Relation to Town Planning" was a welcome change from the usual type of town-planning paper. As a Scottish member of the institution, he naturally places the economic expansion of our industries first and the betterment of our social and communal life second, whereas most writers south of the Tweed reverse these considerations. "The science of town planning must," he says, "primarily involve the study of the evolution of towns in relation to social progress and industrial activity." It is not sufficient to confine our plans to the width and direction of roads and the number of houses per acre, but we must also consider the industries on which the occupants of the houses depend, and which provide the funds for laying-out the roads. As Mr. Harpur said in the discussion on the paper, we must know what industries are coming to the town before we can settle our plan. We must know where the railways, canals and pits are to be placed in the case of an industrial town before we can plan our streets and open spaces. The width of our roads cannot be determined until we know what traffic they are likely to carry. We must arrive at some idea of the economic requirements of the town to be planned, and the forces which will determine its future growth, before we can make provision for its expansion. Mr. Young insists that it is a blunder for town planners to concentrate the greater part of their attention on details which could be better considered at a later stage, and neglect the larger and wider issues on which further growth will hinge. The wide application of physical science to our industrial and social life tends to divert them into entirely new channels. Whereas the majority of our large industrial towns were formerly found on, or near to, our coal-fields, or on some important waterway, we now find that the introduction of other forms of power, such as oil, gas, or electricity, or the improvement in steam plant, has enabled us so to cheapen and improve our transport, and give better travelling facilities, that it has allowed many important industries to be moved from the town into the country.

It is very necessary in town planning that we should not lay out our towns with such cast-iron rigidity that there is no room for future expansion, or for development on somewhat different, and it is hoped better, lines. Many towns are dependent upon some one branch of our staple industries; but it is hardly wise for any town to "have all its eggs in one basket," for the ups and downs of trade are always felt more keenly in these towns than in those which have a greater variety of industries. The problem of special industries and their permanence is of peculiar interest at the present moment. The large centres of industry created by the demand for munitions, although generally of a somewhat temporary character, are in many cases of such vast proportions that the question of their permanence is of vital importance to the town planner. When the war is over many will no doubt disappear, as the factors which now make for usefulness will then act in a contrary manner. Their isolation from our large towns is frequently now a valuable asset; but one cannot keep large bodies of men and women herded together in temporary buildings, with few, if any, of the amenities of life, once the need for their special work has gone, and the attraction of high wages has been lost. On the other hand, the capital invested in buildings and plant is so large that there can be little doubt that every effort will be made to retain many of them for ordinary industrial purposes when peace is declared; and the assistance of town planners will then be needed to make these places healthy and well-organised communities. While Mr. Ross Young agrees that the population of this country should be housed in communal units of reasonable size, instead of in large massed formations, he is of opinion that, in the case of a number of towns within a reasonable distance of each other, a sweeping and comprehensive town plan dealing with the whole area should be prepared, after consultation with all the different authorities affected. The towns in the Clyde Valley and on Tyneside (South Lancashire and the Birmingham district might also be included) are so linked up and dependent on each other that a town plan embracing the whole of the towns in these areas is now becoming recognised not only as desirable, but necessary. Mr. Smith said Mr. Ross Young "wanted to start his town plan at Edinburgh and finish at Greenock"; and Mr. Young, in his reply, said he did. He "would have a plan of the whole industrial area, for if the plan is confined to little schemes it is site planning, and not town planning."

* * *

Motors for Municipal Work.

Another evidence of the increasing interest that is being taken in the use of motors for various kinds of municipal work was afforded by the fact that at the annual conference of the Institute of Cleansing Superintendents all of the papers dealt with one aspect or another of this question. It is true that the new president, Mr. W. Harpur, the city engineer and surveyor of Cardiff, dealt in his inaugural address with the general progress of municipal work in that city, but later in the meeting he submitted a paper dealing with the results of the use of steam tractors in cleansing work. Quoting from a report which he prepared in the year 1906, Mr. Harpur stated that the cost of collecting house refuse by motor worked out at 2s. 4·25d. per ton, and by horse-wagons at 1s. 8·81d. per ton. These figures relate to a time ten years ago, but the experience of the intervening years has not enabled engineers to form a more favourable opinion in regard to the suitability of motor vehicles for this particular type of work. If the ultimate destination of the refuse is at a long distance from the points of collection, it may be an economical proposition to collect by means of horse-drawn wagons and subsequently to transfer the material into motor lorries for conveyance to the tip. But the constant stopping and restarting which are inherent in the ordinary work of collection render motor vehicles unsuitable for this purpose. Mr. Terry, of Nottingham, read a paper in which he pointed out the peculiar advantages of electric vehicles in the removal of house refuse if motors of any type are to be used. He alluded to only two disadvantages—namely, the high capital cost and the low speed. The former is considerably discounted by the fact that electric vehicles claim a long life and low cost of maintenance. Moreover, for the actual work of collection it is open to question whether low speed is in itself a disadvantage. The real question seems to be as to how the working cost per ton using electric vehicles compares with the cost when horse traction is used. The result of such a comparison appears to be favourable to the electric vehicle, a type the popularity of which seems to be considerably on the increase. Mr. Greig, of Glasgow, dealt with the results obtained in street cleansing by motors. This is a class of work for which motor vehicles are peculiarly suitable, for it involves heavy loads, long journeys and few stoppages. It is not surprising therefore to find that

the unanimous opinion of those who have used motor-sweeping machines is that they are, from an economical point of view, a pronounced success. Nevertheless, if the greatest efficiency is to be obtained, they require careful and skilled handling, and Mr. Greig's suggestion that drivers and foremen should receive instruction from motor experts is well worthy of consideration. Mr. James Bee, of Blackpool, also contributed an interesting paper on street watering with electric vehicles. The whole series of papers is of the utmost value to the increasing number of municipal engineers who are being called upon to consider the question of the substitution of motor for horse haulage; and, taken in conjunction with the report of the efficiency division of the Chicago Civil Service Commission, to which we called attention in our issue of October 1st last, affords practically complete information on the subject.

* * *

Middlesex Roads. In his latest annual report some extracts from which appeared in our issue of last week Mr H. T. Wakelam, the county engineer of Middlesex, mentions that the paved tracks of the light railways constructed and leased by the county council have proved during the present crisis of exceedingly great benefit to the road traffic of the county, and especially so where the tracks were laid on roads which have haunches constructed with ordinary water-bound metalling. These haunches are now, in many instances, in an extremely bad condition, and were it not for the tracks in question an absolute necessity would have arisen within the past year for some permanent form of surfacing to take the place of the water-bound metalling referred to. New surfacings of the kind would, necessarily, have been both costly and difficult to obtain. It is therefore worthy of note that in this time of stress and trouble the light railway tracks have been of the utmost value, financially and otherwise, to the county, apart from the convenience they afford the public in the way of quick transit from one centre to another. The tracks have withstood the stress of the heavy transport traffic extraordinarily well, and are standing up well under the heavy loads they are constantly carrying. Some of the creosoted wood paving of the permanent way of the tracks has been down as long as from thirteen to fourteen years, and still presents a remarkably good surface.

Mr. Wakelam also draws attention to the advantages gained, from a point of view of general convenience, during the abnormal conditions prevailing, from the resurfacing work carried out about three years ago in asphaltic macadam along the Bath and Staines roads. These roads have not only been subjected to the heavy stress of transport traffic during the war, but also to the trying winter we have passed through, when snowstorms and bad weather made road maintenance very difficult. During the bad weather at the beginning of 1916 both the Bath and Staines roads were found, owing to their impervious surfaces, the least difficult to clear of snow, &c., and by reason of this the important transport traffic already referred to was much facilitated. Another point in favour of the work carried out in asphaltic macadam has been in the direction of its advantages during the time ordinary road materials have been so scarce and difficult to get.

* * *

The London Tramways Deficit. The supporters on the one hand, and the critics on the other, of the London tramway undertaking are supplied with plenty of material for the promotion of their particular views in the report presented to the London County Council on Tuesday last, showing a deficiency of £73,795 on the accounts for the past year. The Finance Committee state that the nett capital expenditure in 1915-16 amounted to £200,854, and the total debt incurred up to March 31, 1916, was £13,930,660, including £329,083 in respect of stock issue expenses, and £85,000 advanced from the Consolidated Loans Fund at March 31, 1916, on account of 1916-17. The debt outstanding on March 31, 1916, was £9,701,208. The total revenue receipts for the year amounted to £2,339,291 (comparable with £2,399,846 in 1914-15), and the surplus on working was £655,631. The report concludes with the statement that the position of the tramways undertaking causes the Finance Committee no little anxiety, and that "unless improvement is quickly manifested and equilibrium restored between receipts and expenditure the undertaking may, for the first time in its history, involve a charge upon the rates." It is welcome to receive this last assurance, as there is a very prevalent impression among uninformed people in London that the tramways are more or less a permanent charge upon the rates of the Metropolis. As to the chief causes of the deficit we have not far to seek. An ill-advised strike of the employees was responsible for a loss of income of something like £100,000, and the war service allowance for ex-tramway employees has saddled the undertaking with a further sum of £122,000. It is complained that this latter item should not be charged to the tramways account, but it might equally be contended that the war service allowance to teachers ought not to be charged to the reduction account. Clearly these charges must be properly classified, and the logical view is to allocate them departmentally. Though the condition of the undertaking may give rise quite reasonably to anxiety, there is no necessity for despairing of the future. It has so far weathered the storm of a number of quite exceptional difficulties, and with the advent of better times there is every reason to hope it will enter upon a period of normal prosperity.

* * *

Premium Pupils. An interesting discussion took place at a recent meeting of the Halifax Town Council on a proposal to allow the town clerk, the borough treasurer, and the gasworks manager to have premium articled pupils, limited to two each at any one time. The proposal did not include the borough engineer, as that official is already authorised to take pupils, but we call attention to the discussion because the views expressed by the various members illustrate clearly the divergence of opinion which exists in the minds of members of local authorities in regard to this important question. On the one hand, it was said that for municipal appointments all comers should have an equal chance, and that the maintenance of the pupilage system gives an unfair advantage to those young men whose parents can afford to pay the necessary premium. On the other hand, it was pointed out that unless the supply of pupils is maintained there will necessarily be in the future a shortage of properly qualified candidates for important positions of a technical character. For our part we are clear that in the case of engineering appointments involving the administration of vast sums of public money it is in the public interest that those who are appointed should have received a proper professional training. Whether this can be best obtained by pupilage in an office, by attendance at a college, or by a judicious combination of both, may be open to discussion. We have on former occasions expressed our opinion on this point, and we need here only say that the filling of professional appointments by those who have merely gleaned a smattering of technical knowledge while performing clerical duties in an engineer's office, is certainly contrary to the best interests of local authorities and the ratepayers whom they represent.

The Results Obtained in Street Cleansing by Motors.*

By W. GREIG, Cleansing Superintendent, Glasgow.

I propose giving a brief *resumé* of our experience in Glasgow in the realm of street sweeping by means of mechanically propelled vehicles, the motive power of which is derived from the internal combustion engine, the fuel used being petrol.

I have not the slightest doubt that some of the conclusions we in Glasgow have arrived at in this comparatively new sphere of our work will be challenged by my friends here; indeed, I hope it may be so, for only by such means can we hope to gain knowledge, and my object is as much to elicit fresh ideas and information for the benefit of us all as to endeavour to convey to you some results of the large and varied experience the Glasgow Cleansing Department has had in this connection.

In laying claim to this large and varied experience it is hardly necessary for me to remind you of Glasgow's population, size and extent. Our city area is 30 sq. miles; the streets extend to 476 miles; and our inhabitants number 1,075,000.

The streets are principally laid with whin or granite setts, comparatively few being smooth paved. There are, of course, a number of macadam roads

Our first motor street-sweeping machine started work on September 11, 1912, and since then the number has been increased from time to time, until at present the department owns twelve motor street-sweeping machines—viz.: 6 18-h.p. by the Lacre Motor Company, Letchworth; 5 12-h.p. by M. Laffly, Boulogne-sur-Seine; 1 16-18-h.p. by Thomas Green & Sons, Leeds.

All the machines are driven by live axle, with the exception of the "Lacre" vehicles, which are chain-driven. All are fitted with rubber tyres. The length of the brushes varies from 6 ft. to 7 ft. 2 in., and the actual width swept ranges from 4 ft. 10½ in. to 5 ft. 4½ in. In the case of the Laffly machines the brush is all in one piece (7 ft. 2 in. in length), but in the other types it is made up of segments measuring approximately 16 in. in length. With one exception the machines are equipped with water tanks having a capacity of 80 to 150 gallons, from which the water is sprayed under pressure by means of atomisers. The vehicles are also fitted with "cabs" and adjustable wind-screens to protect the driver during inclement weather—an advantage which he no doubt appreciates when contrasting his lot with that of his colleague on the horse-driven machine. These are the chief features of our motor-sweepers, but I shall be pleased to supply anyone interested with a full specification should he desire it.

When the introduction of mechanically driven vehicles in place of horse-drawn vehicles was under consideration in Glasgow, the two points which had to be carefully borne in mind were our old hard-worked friends "economy" and "efficiency." These are vital factors—not only in cleansing work, but in all work.

As regards economy, it is recognised that the most profitable work for petrol-driven commercial vehicles is that which involves (1) heavy loads; (2) long journeys; and (3) few stoppages—as short as possible. In cleansing work, motor street-sweeping machines approach most nearly to these ideal conditions, and this, I think, has been demonstrated in every town which has introduced such machines.

The journeys are long, the stoppages few and short, whilst the load—the area swept in this case—is greater than in horse-drawn machines, and this should be the greatest possible consistent with speedy working, taking into consideration traffic conditions, running costs, and tear and wear of machines. It is not surprising, therefore, to find that the unanimous opinion of those who have used motor sweeping machines is that they are, from an economical point of view, a pronounced success. I am able to show, from the tabulated statements submitted with this paper, that the results obtained in Glasgow as compared with horse-drawn vehicles are all in favour of mechanical sweeping.

As to efficiency, the general consensus of opinion is that motor street-sweeping machines do the work of sweeping quite as well—possibly rather better than horse-driven sweeping machines. There may be superintendents and others who hold the view that horse-drawn machines do the work better, but I am of opinion they are in the minority. I am afraid that those who maintain that the motor street-sweeping machine does not perform its work efficiently are swayed to some extent by prejudice. I am assuming, of course, that the motor sweeper is operating under good working conditions. It is the case that the motor sweeping machine, when the brushes are nearly worn out, may not give as good results during the last half shift when the brush is in reality too short for satisfactory work. This is due to the fact that the first half shift of the last day's work has worn the brush to that point. It must be borne in mind that a motor sweeper travelling over six miles per hour wears out the brush in a much shorter time than a horse-drawn machine, and therefore a half shift in a motor sweeper makes an appreciable difference in a brush, whereas in a horse-drawn machine it is insignificant.

Working Costs of Motor Sweeping Machines for year ended 31st May, 1916.

Time—Working days		1,895
,, Actually sweeping, hours		14,846
,, Average number of hours sweeping per day		7·83
Total distance travelled to and from sweeping points		8,330
Mileage swept	Total	89,393
,, ,, per day	Average	47·17
,, ,, per hour	Average	6·02
Area swept, sq. yds.	Total	275,814,954
,, ,, ,,	Daily average	145,530
,, ,, ,,	Per hour	18,578
Motor spirit :—		
Total quantity, galls.		9,811
Total cost		£585 15 5
Miles per gallon, including travelling		9·96
,, ,, less travelling		9·11
Cost per mile, including travelling		1·44d.
,, ,, less travelling		1·57d.
Drivers' wages		£599 11 11
Repairs, cleaning and supervision		505 5 4
Motor spirit		585 15 5
Oil, grease and sundries		90 5 0
Brushes, including cost of fitting		813 5 8
Tyres, upkeep of		135 19 10
Insurance		76 12 6
Depreciation (20 per cent per annum)		694 4 0
		£3,500 19 8
Cost per 1,000 square yards swept, including repairs		3·05d.
Cost of brushes per 1,000 square yards swept, including repairs		·71d.
Saving compared with horse-drawn machine		£1,321 12 3

This is one of the few points in which the actual conditions suit the horse-drawn machine better than its rival and enable it to show in a favourable light—it sweeps well to the end of the life of the brush. But this adverse criticism of the motor vehicle only applies to machines working during the night, or at a considerable distance from the depot during the day. If working during the day within reasonable distance from the depot, the worn-out brush can be taken out and replaced. With machines working during the night, or at a considerable distance from the depot during the day, the unsatisfactory work can be reduced to a minimum by working the machines in teams of three or four, utilising the machine with the shortest brush to perform the first stroke throughout the sweeping operations.

A special feature of the motor sweeper which is

* Paper read at the annual conference of the Institute of Cleansing superintendents, held at Cardiff.

worthy of mention is its water tank and atomiser. In sweeping operations during dry weather it was formerly necessary to water the streets in advance of the machine. By the introduction of the water-spraying apparatus on the motor sweeper the time of the horse and man with the watering cart is saved. The state of the surface of the streets is frequently such that smooth-paved streets require watering, whereas streets laid with setts do not need damping. Under these conditions the atomiser shows to advantage. It also frequently happens in this variable climate of ours that in the middle of the advance watering operations one or more good showers cause the water cart to look ridiculous, and the work of the horse is rendered superfluous so far as the area watered has not been swept before the rain came on. How favourably the atomiser shows up under such circumstances is obvious. The only difficulty experienced with the spraying apparatus is that it chokes readily with glut, or fine dust or grit, and consequently requires constant inspection and cleaning. In fact, in Glasgow and, I understand, some other places, it has been necessary to increase the mesh to meet this objection, at the sacrifice of extra time lost in filling the tank more frequently.

Another advantage of considerable value to be obtained from the use of motor sweeping machines may be mentioned here. It is the working of these machines in double shifts. In large towns, where much sweeping falls to be done, and traffic and other conditions permit of its being partly performed during the day, the saving to be effected is too obvious to require further comment. That is, of course, provided always that day cleansing is approved. This is, I am aware, a matter of opinion, but in any case it is outside the scope of this paper.

RUNNING COSTS

In submitting statistics of the running costs of our motor sweeping machines, I would like to say that I do so without intending to set up a comparison with the results obtained in other cities and towns, whether more economical or otherwise. Speaking generally, comparisons of costs between one place and another are fruitful of error and misunderstanding, and the reasons are not far to seek. It would be difficult to find two industrial centres in which there exists anything like equality of conditions. The volume of traffic and the proportion of area to population differs almost everywhere. Then again, the topographical and climatic conditions and the nature of the surface of the streets—which in conjunction with the extent of traffic largely determines the cost of street cleansing—are generally dissimilar.

It is only to be expected that better results will be obtained in towns where good sweeping conditions generally exist than in places not so well favoured. In Glasgow the density of population, the vastness of industry, and the great volume of traffic, render the conditions undoubtedly severe. The material to be removed is greater than in the same mileage of streets with equally good surfaces, but under different conditions as to population, industry and traffic. The state of the dirt and its adherence to the surface is determined by the amount of traffic over it, and the prevailing weather conditions. I should think that these drawbacks are more in evidence in Glasgow than in most towns. The condition of the surface—paved or otherwise—is a factor of great importance. Fortunately, in Glasgow there is no reason for complaint in this connection. A vast improvement has been effected during the last dozen years, and the condition generally is very good. The continued laying of smooth impervious paving and the gradual abolition of macadamising is assisting greatly in this direction. It is therefore evident that inferences drawn from comparisons between places that are not comparable cannot have any real value.

WORK IN ENGLISH TOWNS

While speaking of comparing results in different places, it may be pointed out that the amount of sweeping done by a horse-drawn machine in Glasgow is approximately seventeen miles of track. In English towns this length is never, to my knowledge, reached, and is generally given as about twelve miles. The effect of this circumstance on comparisons is clear. Motor sweepers may be doing exactly the same amount of work in two different towns, and yet in the one be doing the work of three horses, and in the other the work of four. A bald statement that a motor sweeper is doing the work of so many horses in "A," and displacing so many in "B," is, it will be agreed, valueless for the purposes of comparison.

It follows that the standard of horses engaged in street sweeping has a distinctive bearing on the question of comparative cost as applicable to mechanical haulage. In this connection I am of opinion that in Scottish towns the greater amount of work performed can only be explained by the fact that horses of the Clydesdale breed are employed as against those of the "Shire" type in England.

I had the privilege of visiting an English town quite recently, and as the result of personal observation of horses engaged at cleansing work, I have no hesitation in stating that our horses overtake from 50 to 75 per cent more work than in the town referred to.

In some towns in England it is claimed that a motor sweeping machine performs the work of three horse-drawn vehicles, and in other places the machines are said to displace six to seven horses. We have not yet attained the latter displacement, but as near as possible one motor sweeper in Glasgow is overtaking the work of three horses. While this is satisfactory so far as it goes, and is undoubtedly more economical than horse-drawn vehicles, one must not, in comparing mechanical haulage with that of horses, run away with the idea that all the advantages are on the side of the first-mentioned. The bulk of them do lie with it and give it claims which fully justify its preferment, but there is something to be said for our tried and faithful servant the horse—still holding its own in many branches of cleansing and other work. I refer particularly to its mobility, and this, along with reliability, constitute the most important points in its favour. During climatic changes, or for other reasons, it can be transferred on the shortest notice to do any class of work of a haulage nature.

I will illustrate my meaning. Suppose a severe snowstorm in winter takes place, every available horse has been taken from refuse removal and other work and is fully occupied in the removal of snow. Immediately the snow has been removed frost sets in, rendering street sweeping of little avail on account of the hard surface. In that event sweeping may be almost entirely suspended, and the horses put to forward the work which had been stopped through the snowstorm. There are other periods of the year when this interchangeability would prove extremely advantageous and economical. A motor sweeper can only do the sweeping. This is a point of paramount importance to smaller towns; even in larger towns where the major part of the sweeping, say 80 per cent, is performed by motor vehicles, it may still be expedient to reserve the remainder for horse-drawn machines.

IMPORTANT POINTS.

To get the best work out of a motor sweeping machine it should be worked on long stretches, with as few turns as possible. This entails the working in teams of three or four machines, according to the width of streets to be swept, in order to allow the work of gathering and removal to proceed expeditiously. Another advantage is an appreciable saving in front tyres. The turnings are invariably in the shortest radius, and when frequent the grinding action is very detrimental to the tyres.

It is essential that the mechanical parts of the machine should be kept in the best of order. An annual overhaul, even if no fault discloses itself, is to be recommended, and I would therefore advocate that there should be at least one spare machine in a fleet of ten to twelve machines, provided such a number can be profitably employed.

The drivers should be selected with the greatest discrimination with regard to skill and care and interest in their work. During war time this is difficult in fact, impossible and in Glasgow the results are reflected in the loss of working days and the repairs bill. An alert and intelligent foreman can assist the work by exercising close supervision, planning of work and judgment of conditions from night to night. Weather conditions vary greatly, thus quickly affecting the state of the surface of the streets. This in turn determines the pressure of the brush on which, to a large extent, the petrol consumpt, the life of the brush, and other wear and tear of the machine depends. A careless foreman or unobservant driver would negligently keep the brush at the same pressure on the surface of a street that is hard and dry, as for one of a pasty nature. Regulation of

pressure is absolutely necessary in the interests of economy.

At this juncture I would offer the suggestion that in normal times considerable advantage would be derived from a series of lectures and demonstrations by motor experts to drivers and foremen. In fact, the art of driving and the knowledge how to effect simple running repairs should form part of a foreman's training, who, as a rule, is usually more conversant with the care and treatment of horses. Such lectures and demonstrations would prove beneficial to both employee and employer, and be the means of instilling into the former a desire to take a healthy and intelligent interest in motor vehicles, and grasp how to make the wheels go round in the sweetest and most economical manner.

A WORD TO MANUFACTURERS.

Perhaps a word to motor manufacturers may not be amiss. They should not rest on their oars under any misapprehension that their product is the last word in sweeping machines. They should, and I believe will, devote their closest efforts to bring the machine to a greater degree of perfection, particularly with regard to reliability. The unreliability of the machines may be due to one or more of the following reasons: (1) defective design; (2) bad workmanship or material; (3) rough usage; (4) negligence in attention to repairs more especially of the "stitch in time saves nine" character. The first lies with the experts and there is no excuse for the second. With regard to the third and fourth these are the concern of the users, but at the same time the makers can help their customers very materially in these respects, and it is to them I would direct their special attention. Rough usage and careless handling are always worrying all users of motor vehicles, and improvements in design with a view to greater stability and to making the machines "fool-proof" as nearly as possible are greatly to be desired. Repairs and breakdown at awkward times are sources of much annoyance and inconvenience. Improvements in design making for greater facility of continual inspection, and speed and simplicity in carrying out the necessary repairs, would save much loss of time, not to mention temper, and would approach the ideal which cleansing superintendents are striving for in this as in every other department of their work.

In conclusion, I may say that I feel honoured in being asked to appear before you and give you, as a corporate body, the benefit of our experience in Glasgow in regard to this branch of mechanical enterprise. I quite realise that it is only by making ourselves helpful to one another—even at the risk of well merited criticism—that we can become more serviceable to our respective corporations. To be harnessed with the responsibility of cleansing great cities and towns must of necessity make cleansing superintendents ever on the alert for ideas suggestive of improvement, in order that we may make steady and continuous progress in our important sphere of municipal work. To a great extent we are responsible for the health and comfort of the citizens, and in our effort to impart sweetness and attractiveness to our streets, I make bold to say that, speaking generally, our army of ratepayers are receiving better value for their money than they have ever known. For much of our advancement we have in no small measure to thank our connection with the Institute of Cleansing Superintendents, and I am of opinion that, in view of the rapid progress of inventive genius, it would be well if corporations were more generous in affording to members of committee and officials greater opportunity of seeing for themselves what is being done in the principal cities. The expenditure involved would in all probability be more than repaid by the introduction of methods leading to economy and efficiency, and at the same time assist even a cleansing superintendent to excel in a calling which, to a certain extent, is shrouded in an obscurity which never darkens the portals of less important but more attractive branches of municipal work.

London Arterial Roads. With reference to the request made to Mr. Asquith and Mr. Walter Long to receive this week a deputation from the Second Main Conference on Arterial Roads in Greater London, in support of resolutions passed at that conference on May 19th, it is understood that the Prime Minister will not be able to receive the deputation, but that Mr. Walter Long will probably do so. No date has yet been fixed for the event.

ALLOWANCES TO OFFICIALS ON SERVICE.

A LYME REGIS DISCUSSION.

At the last meeting of the Lyme Regis Town Council (the *Bridport News* reports) the town clerk said that consideration had to be given as to whether the grant of £25 per annum made to Mr. F. H. McDonnell, the borough surveyor, while serving in the Army should be continued in view of the Local Government (Emergency Provisions) Act, 1916, which provided that no excessive payment could be made without the sanction of the Local Government Board. The grant to Mr. McDonnell would no doubt come within this category, as his pay as a captain in the Royal Engineers would most probably exceed his civil remuneration as an officer of the council. Therefore, if they wished to continue the payment they must obtain the sanction of the board, and he pointed out that the local authority need not reduce a payment so made where in a case like the present an officer, by getting promotion, received higher pay, but the approval of the board was necessary just the same.

Replying to Councillor Budgett, the town clerk said Mr. McDonnell joined the Engineers as a subaltern. He did not know what the pay was, but he thought the council estimated it at about £80 when making the grant of £25. As to the pay as a captain, he had enquired, but had been unable to obtain the information. It was probably something like £200 a year.

Councillor Long said at the time the grant was made the council considered they were making up Mr. McDonnell's army pay to the same amount as he was previously receiving as their surveyor, and in view of the fact that this point no longer arose, as the officer was now captain and his pay consequently in excess of his civil remuneration, he considered the council should take a similar course to what they had done with their other employees. He moved that the grant be discontinued.

Councillor Camplin, seconding, said there could not be the slightest doubt in anyone's mind that the grant was made to make up the civil remuneration. As this necessity had ceased they should put him on the same footing as the other employees who were on service, and he reminded the council that in one case a reduction had already been made. Councillor Budgett thought it was hardly fair to do away with the grant. They agreed to give Mr. McDonnell the £25 a year while on service during the war, and it was a contract, even if it was not a legal one, which they ought not to repudiate. The council must remember that when an officer secured promotion, and, consequently, increased pay, it was because his services merited it.

Councillor Wiscombe supported this view, and pointed out that it was no encouragement for a man to get promotion to take away the grant. He felt they were bound in the matter.

Councillor Budgett moved as an amendment that the council apply to the Local Government Board for sanction to continue the grant.

Councillor Wiscombe seconded. Councillor Long, replying on the debate, contended that the grant was made owing to Mr. McDonnell's army pay not being up to his civil remuneration. He claimed that if the grant was continued it was different treatment to what they had meted out to other employees. On a division, four votes were given for the amendment.

The Mayor said he would give his vote for the amendment and let the Local Government Board decide.

Motor Fire Engines for the London Fire Brigade.—The London County Council Fire Brigade Committee have decided to purchase two motor fire engines from Leyland Motors (1914), Limited, at £887 each. At the same time they report that they have sold two second-hand motor engines for £500 each, and two at £400 apiece.

Restrictions on Building Work.—Mr. Montagu, the Minister of Munitions, announces that as from yesterday no one may carry on any building work without a licence, unless the cost of the work is less than £500 and no constructional steel is involved. "Building work" includes alterations, repairs, decorations and demolitions, also the construction of railroads, docks, harbours, canals, embankments, bridges, tunnels and piers. Government contracts and local authorities' contracts sanctioned by the Government are exempt. Applications for licences should be addressed to the general secretary, Ministry of Munitions, 6 Whitehall-gardens, S.W.

Improvements of Highways to Meet Modern Conditions of Traffic.*

By W. H. SCHOFIELD, ASSOC.M.INST.C.E., County Surveyor, Lancashire.

It would, at the first glance, appear somewhat inopportune to be discussing road improvements at this time when local authorities are being pressed both by the Government and the local ratepayer to reduce all public expenditure to the lowest possible limit.

In Lancashire, however, and no doubt the same can be said of other counties in the kingdom, the heavy mechanically propelled traffic has considerably increased on many of the main roads, in spite of, or perhaps it would be almost more correct to say because of, the war, and the problem of road improvement is as urgent as ever.

The railways being now under Government control are being extensively used for naval and military purposes, with the result that manufacturers find increasing difficulty in obtaining delivery by the railway companies of raw materials required by them, and in the distribution of the manufactured goods among their customers.

To get over this difficulty a very considerable number of commercial firms have purchased and are running their own motor wagons instead of sending their goods by rail and in consequence the number of heavy mechanically propelled vehicles using some of the roads has increased by as much as 60 per cent. in excess of that in existence before the commencement of the war, and in some exceptional cases considerably more.

The main problem in this county is therefore that of meeting and providing for the improvement of the roads in such a manner as to render them capable of carrying the heavy weights at the high speeds which are allowed by the present law, and which, to make matters worse, are constantly being exceeded.

The considerable volume of local traffic which existed previously to the adoption of mechanical transport to a certain extent compelled the boroughs and larger urban districts to build their principal roads with substantial foundations, and to surface with more permanent materials, and these areas were consequently in a much better position to cope with the new form of traffic which has come on to them during the past five or six years rather than the intervening lengths through the rural districts which, although they were generally sufficiently strong to reasonably carry the horse-drawn traffic, were often insufficiently drained, and void of any substantial foundation.

Many of these rural roads, although forming the only means of communication by road between large towns, formerly only carried a traffic of a light type, and were well maintained as water-bound macadam surfaces, to which no very serious damage was done by the addition of a moderate number of light motor cars, particularly if the macadam were frequently tar-sprayed, the main cause of complaint unless tar-spray was used being that of the dust raised by the quick-moving vehicles.

The conditions now existing are, however, very different, as the rural roads are having to carry weights far in excess of those conveyed along them at any previous period and at a much higher rate of speed, in fact the speed of heavy motor vehicles being restricted in populous areas by the exigencies of the local traffic, and the fact that the police supervision is generally able to be more effectively applied, is often increased in the rural areas beyond that allowed by law, to make up the average running.

The rural roads for this reason, while being less able to bear the traffic owing to weak construction, are often more sorely tried than town streets.

The most pressing need for improvement in this county is therefore the strengthening of the foundations, improved surface and subsoil drainage, and the better surfacing of the roads in the rural areas.

The following examples show the alteration in the character and volume of traffic on roads of this class.

Statistics taken on the Liverpool and Manchester road in July, 1911, show that there were 1,104 mechanically propelled vehicles and 1,591 horse-drawn vehicles in seven days, as compared with 2,955 mechanically propelled and 1,303 horse-drawn vehicles in seven days in January, 1916. Of these in July, 1911, heavy motor wagons numbered 155, and in January, 1916, numbered 1,694 for the seven days.

The comparison of weights for the same periods is as follows:

July, 1911.

Weight of mechanically propelled vehicles ...	2,236	tons
„ horse drawn vehicles	1,677	„
Total for seven days ...	3,913	„

January, 1916.

Weight of mechanically propelled vehicles ...	15,715	tons
„ horse-drawn vehicles	1,502	„
Total for seven days ...	17,217	„

PRESTON AND BLACKPOOL ROAD.

		No.	Weight.	
Feb. 1911	Mechanically propelled ...	584	1,586	tons
	Horse drawn	738	746	„
	Total for seven days ...	1,322	2,332	„
Feb. 1916	Mechanically propelled ...	1,498	3,502	tons
	Horse drawn	565	629	„
	Total for seven days ...	2,063	4,131	„

MANCHESTER ROAD, RAMSBOTTOM.

Feb. 1911	Mechanically propelled ...	285	1,340	tons
	Horse drawn ...	1,382	1,685	„
	Total for seven days ...	1,667	3,025	„
Jan. 1916	Mechanically propelled ...	1,373	6,461	tons
	Horse drawn	854	1,171	„
	Total for seven days ...	2,227	7,632	„

The total number of heavy motor lorries and trailers for seven days in February, 1911, included in the above figures for Ramsbottom was 122, compared with 913 in January, 1916.

The foregoing weights are calculated on the assumed weights set out in the first column of the statistics of traffic (summary form) issued by the Road Board, and which the writer submits, at any rate so far as the commercial traffic of Lancashire is concerned, are substantially underestimated.

These examples of the comparatively recent increase of traffic on roads lying outside the populous areas can be multiplied many times, but the foregoing will probably be sufficient for the purpose.

In the case of the Preston and Blackpool road, the writer desires to point out that the winter traffic statistics only are given. In the summer the figures for mechanically propelled vehicles, particularly those of the light type, are more than trebled.

Although the recent addition to the number of heavy commercial motors using the roads in this county may be due at the present moment to restricted railway facilities, it is doubtful whether any considerable portion of the traffic will be restored to its original channel when times become normal, and if, on the other hand, the rate of increase during the past five years is maintained in the future, it will become imperative to adopt a still more substantial and expensive form of improvement and reconstruction of rural main roads than has so far been the general practice.

In addition to the heavy commercial motor, the great increase in the numbers of heavy motor chars-a-bancs, and motor 'buses which have come into use chiefly for pleasure parties, particularly in the neighbourhood of the seaside towns, such as Blackpool and Southport, are the cause of a substantial amount of damage to the water-bound rural roads.

Unfortunately, one has to admit that the reconstruction and improvement of roads generally had not even before the war kept pace with the development of the mechanically propelled vehicles, and under the present conditions of reduced expenditure by county and local authorities, and the loss of Road

* Paper submitted at the recent annual meeting of the Institution of Municipal and County Engineers at Blackpool.

Board grants, it seems very probable that this work will fall still further behind.

SURVEYORS' DIFFICULTIES.

In addition to the question of finance, surveyors are now faced with the impossibility of obtaining a sufficient supply of either materials or labour for any extensive works of reconstruction, and even for the maintenance of existing conditions.

In normal times the financial problem provides the greatest difficulty, particularly in county and rural areas, which generally have a very long mileage of roads requiring reconstruction to meet the needs of the new form of traffic, and a limited purse out of which to defray the cost.

In this county there are 641 miles of main roads, of which 333 miles are in urban and 308 miles in rural areas.

The rural main roads, with a few exceptions (chiefly those which have been reconstructed of recent date), are without any substantial foundations, and consist of an accumulation of broken stone varying from 6 in. to 12 in. in thickness, laid on the natural subsoil.

The same remark applies to a considerable mileage of the main roads in the outlying portions of urban districts.

To reconstruct, say, 350 miles of these roads with a hand-pitched gritstone rubble foundation, and surfaced with a 4-in. consolidated coat of tar-macadam, including a 5-in. by 12-in. gritstone-edging and improved drainage, would cost approximately £1,848,000, on which the repayment over a period of ten years, with interest at 5 per cent, would amount to £240,240 per annum, or an annual charge of £686 per mile, to which would have to be added some allowance for maintenance, particularly towards the end of the period.

Although the provision of substantial foundations therefore is theoretically desirable, the financial difficulty is so great as to render it almost impossible of attainment by authorities having a large mileage of roads to reconstruct, in any reasonable period of time.

It has, so far, been found possible in this county to meet the needs of modern traffic on the rural main roads by strengthening the road crust by the addition of a coat of tar-macadam.

The practice has been, except in special cases where the natural subsoil is bad, and reconstruction is absolutely necessary, to strengthen the haunches of the road by adding a width of 2 ft. to 3 ft. of 9-in. hand-pitched gritstone rubble, on a 3-in. consolidated bed of engine ashes, and by increasing the thickness of the existing crust by the addition of a 4-in. or 4½-in. consolidated coat of tar-macadam.

The average cost of this work for an 8-yds. carriageway amounts in this county to approximately £3,200 per mile.

Even this method of strengthening taken over a period of either seven or ten years makes a very heavy addition to previous maintenance charges.

In the southern half of the county most of the urban roads carry a much heavier commercial traffic, as they provide the means of communication between twelve of the eighteen large county boroughs situate within the geographical county, varying in distance from 1 mile to 20 miles apart, and of fifteen out of eighteen non-county boroughs.

In this area the main roads were a few years ago generally paved with local millstone grit setts, but this type of surfacing was found to be quite insufficient to carry the heavy motor-wagon traffic, particularly those with steel tyres, and the policy of substituting granite sett paving on a concrete foundation has been adopted as being the most economical method in the long run.

This class of paving also provides a much improved surface for the light motor vehicle.

The cost of granite paving, either with 4-in. by 5-in. setts of 4½ cubes on a 6 to 1 Portland cement-concrete foundation, 6 in. in thickness, averaged in this county previous to the war 15s. per super. yard.

The writer is of the opinion that where the service of heavy mechanically propelled vehicles, whether motor 'bus or commercial wagon, is such as to necessitate the provision of new foundations, it will generally prove more economical to adopt concrete foundations and granite or wood paving.

The writer has, like most other surveyors, experimented with various materials for road surfacing. As, however, so much information has been already supplied in previous papers with regard to these he does not propose to repeat it. In the writer's experience the most successful material for surfacing rural main roads at a reasonable cost has undoubtedly been tarred iron-slag macadam.

This material is fortunately obtainable within the county at a moderate price, and so far there have been no failures of any extent. Lengths which have now been laid for seven years have required no repairs except tar-spraying in alternate years, and are still in good condition.

Tar-grouted granite-macadam was extensively laid some five or six years ago with varying degrees of success or failure, but this method has been practically abandoned in favour of tar-macadam, partly because the latter method is substantially cheaper in its first cost, and partly because the climatic conditions of this county are usually such as to limit the successful employment of tar-grouted macadam to a very short period during the summer months.

Various lengths of granite-macadam coated with tar have been laid, but these have not by any means proved uniformly successful.

"Durax" paving has also been laid on some of the more heavily trafficked roads, but the difference in cost per super. yard between that and dressed cubes or setts is, in the writer's opinion, not sufficient to make its general adoption economical, especially if the shorter life of "Durax" paving is taken into account.

WIDENINGS.

The widening and straightening of the existing main roads is almost as pressing as the improvement of surfaces if a safe passage is to be provided for the mechanically propelled vehicles of the present day, particularly of the motor char-a-banc, or rubber-tyred commercial motor wagon types.

In the writer's experience these vehicles, which are allowed by law to be used up to 7 ft. in width, and an unlimited length, are usually driven at a speed much in excess of the legalised speed limit, and a greater width of carriageway is therefore required than formerly, if accidents are to be prevented.

The old well-known rule of the provision of a width of 8 ft. as giving ample space for each line of traffic has become insufficient to meet the present-day requirements, and in the writer's opinion multiples of 10 ft. are at least now desirable for safety, with considerable further widening at sharp curves.

The construction of short diversions will often prove a much more satisfactory manner of improvement than the widening of two or three contiguous curves, as, although the first cost may be substantially greater, the saving in future maintenance will generally be sufficient to recoup the extra expenditure in a few years' time.

The widening and improvement of the junctions of roads is one of the most pressing needs of the times, particularly in rural areas, where the speed of the modern vehicle on the main routes is usually unrestricted either by the exigencies of other traffic or the attentions of the local police constable.

If, however, the widening, straightening and improvement of curves and road junctions is only to result in a still further increase of the present excessive speeds, it is doubtful whether the desired purpose will be attained, but there is no question that the maintenance charges will be increased rather than diminished.

The Metropolitan Paving Committee.—A report submitted to a recent meeting of the General Purposes Committee of Holborn Borough Council stated that the Westminster City Council had decided not to appoint a representative upon the Metropolitan Paving Committee this year, as they were of opinion that, notwithstanding its usefulness in the past, it was desirable in the interests of economy that the committee should now be discontinued. The Holborn Committee expressed regret at this decision, as in their opinion the committee had served and would continue to serve a very useful purpose. There are nine Metropolitan Paving Authorities, including the City Corporation, represented upon the committee, and the expenditure, which in normal times amounted to about £100 per annum, is divided among them rateably. During the war the expenditure has been reduced to about one-fifth of this amount and this small saving should not be allowed to terminate the committee's usefulness. On the recommendation of the committee it was agreed that a communication should be addressed to the Westminster City Council asking them to reconsider their decision.

Institute of Cleansing Superintendents.

ANNUAL CONFERENCE AT CARDIFF.

Fifty authorities were represented at the nineteenth annual conference of the Institute of Cleansing Superintendents which opened on Tuesday morning at the City Hall, Cardiff, under the presidency of Mr. W. Harpur, M.INST.C.E., the city engineer. Following the transaction of a portion of the business on the agenda, including the delivery of the presidential address—the delegates, to the number of 137, were accorded an official welcome by the Lord Mayor (Councillor R. J. Smith, M.B.), who said that in municipal activity Cardiff had taken a very foremost place, and that wherever the delegates went they would see evidence of municipal and commercial enterprise. The appointment of Mr. Harpur as president of the institute would be regarded not only as a compliment to their city engineer, but also to the city. None of the officials had a higher place in the regard and the affection of the corporation than their distinguished president. No corporation had ever been better served by an official than had Cardiff by Mr. Harpur. Those present at the conference, which was brought to a close yesterday afternoon, included:* Messrs. R. Adam, inspector of cleansing, Ayr, D. Allen (Woolwich), G. H. Anderson (Middlesbrough), H. C. Bascombe (Wallasey), J. Beckett (Liverpool), James Bee (Blackpool), W. J. Bosley (Southampton), F. Brockington (Worcester), F. W. Brookman (Rochdale), E. Call (Bradford), A. Cant (Tottenham), H. Cousins (Wolverhampton), T. B. Crookes (Finsbury), R. H. Crummack, deputy borough engineer, Dover, J. C. Dawes (Keighley), F. A. Dowse (Hackney), J. Duncan (Dundee), W. H. Eccles (Stockport), H. C. J. Edwards borough engineer, Lambeth, E. I. Evans, surveyor, Penarth Urban District Council, J. Gibson (Edinburgh), W. Greig (Glasgow), W. H. Hamblett (Salford), W. Harpur, city engineer, Cardiff, J. L. Haslop (Oldham), J. R. Heath, borough surveyor, Swansea, H. Hopkinson (Portsmouth), W. H. Inger, street cleansing department, Bradford, James Jackson (Birmingham), A. G. Jefferies (Hampstead), D. Kennedy (Kensington), J. Leng (Stockton-on-Tees), T. Lloyd (Preston), W. E. Lowe, engineer and surveyor, Pontypridd Urban District Council, J. Marginson (Blackburn), L. S. McKenzie, city engineer, Bristol, J. C. Pardoe, surveyor, Barry Urban District Council, J. Priestley (Sheffield), William Ross, burgh surveyor, Motherwell, F. Smith (Bolton), W. J. Steele, city engineer, Newcastle-on-Tyne, R. H. Storer (Tynemouth), J. Terry (Nottingham), S. Thornley, assistant superintendent, Leeds, H. Tillstone, borough engineer, Brighton, T. Turner (Bury), F. W. Sykes (Newcastle-on-Tyne), T. H. Whitewick (Surbiton), H. F. Wigfield (Leicester), T. J. Williams (Swansea), and R. Williamson (Manchester).

CARDIFF'S DEVELOPMENT.

Mr. HARPUR said it was his first duty upon taking the presidential chair to thank the members for placing him in the most privileged position it was within the power of the institute to confer upon any of its members. He assured them that the honour was keenly appreciated, and it would be his pleasure during his continuance in the office to promote the interests of the institute in any way he possibly could. He wished to offer the institute a hearty and sincere welcome to what he might with some excusable pride claim to be one of the most pleasant and progressive commercial cities in the kingdom, a city in which the often unpleasant, anxious, and irksome conditions of one's professional or commercial life were to some extent compensated for by the otherwise pleasant every-day surroundings.

Mr. Harpur proceeded to give some historical particulars of Cardiff from the municipal standpoint. One of the principal subjects deserving attention was, he observed, the astonishing progress which had taken place during the past century in the commerce and population of the city, and which had rendered Cardiff the metropolis of Wales. In 1811 the population of Cardiff was only 2,577; but from that time it went on steadily increasing until in 1871 it had reached 39,536. During this time the area of the municipal borough was 2,791 acres, but under the powers of the Cardiff Improvement Act of 1875, the districts of Canton, Roath and Grangetown were added to the borough, and the area thereby was increased to 8,095 acres, its present dimensions. In 1881 it was found that the population had increased to 82,761, or an addition in ten years of 43,225; but this great increase in population, largely due to the extension of the borough boundaries, was continued for some years until the population began to overflow the city boundaries, for the returns of the census for 1891 showed the population to have increased by 46,088 in the preceding ten years, the returns for 1891 being 128,849, or an increase in the ten years of 55·7

MR. W. HARPUR, M.INST.C.E.,
City Engineer and Surveyor of Cardiff; president of the Institute of Cleansing Superintendents.

per cent upon the population of 1881. The population of the city in 1901 was 164,333, and in 1911 it was 182,259, while it is now estimated to be 188,495.

The coal and iron trades were the mainspring of the commercial prosperity of Cardiff, and the port had achieved the distinction of being the first port in the world for the volume in tonnage of its foreign exports.

DRAINAGE.

Upon the adoption of the town council in 1849 of the Local Government Act of 1848, Cardiff started upon a period of public improvement, which had gone on ever since, and was still going on, and was telling greatly in the health, comfort and enjoyment of the people. Extensive drainage works were commenced in 1853, and from that time until the present had been continued and extended as time and necessity required.

The configuration of the site upon which the town lay was almost flat, except in the north-eastern extremity, and consequently the question of sewerage had been a difficult one. A large portion of the town was built upon a level with high-water mark of ordinary spring tides, and the sewers (which discharged into the Bristol Channel) were of necessity some depth below the surface of the ground, and consequently all the sewers, with the exception of those in the Western District, where the sewage was pumped, were tide-locked for some time before and after high-water of all ordinary and spring tides; and in order to store the sewage when the tide-valves were closed large sewers were provided which acted as storage reservoirs until the tide receded, when the contents were discharged. The evenness of the surface of the ground had also rendered the question of obtaining suitable gradients for the sewers a difficult one, some of the gradients being as slight as 1 in 2,000. Notwithstanding these difficulties, however, Cardiff was well and efficiently sewered, and few towns could boast of a better system of sewerage. Every house was provided with one or more water-

* Cleansing superintendents except where otherwise stated.

closets; there were no cesspools, middens, or ash-pits in the city.

WATER SUPPLY.

Up to the year 1850 the town was dependent for its water upon various private and public wells. In that year an Act was obtained by the Cardiff Waterworks Company, empowering them to construct works near the river Ely, about 3 miles from the town, the water there being derived from the dolomite formation of the old red sandstone taken into culverts running alongside the river Ely, and then pumped into service reservoirs for the supply of the town and district.

In 1860 the company obtained further powers, enabling them to take the waters of various streams on the limestone gathering grounds at Lisvane, three to four miles from Cardiff, and to construct at Lisvane a storage reservoir holding 80,000,000 gallons of water, together with filter-beds, the town being supplied from this source by gravitation.

In the year 1879 the Cardiff Corporation obtained an Act of Parliament empowering them to purchase the whole of the existing water undertaking from the company, and the purchase of the works was shortly afterwards completed, the amount paid to the company being £320,000.

It was found that the existing works would soon prove inadequate to meet the increasing consumption of water, owing to the very rapid growth of the town and district; and after an exhaustive inquiry into the merits of several sources for future supply, it was decided to promote a Bill in Parliament to obtain water from the Taff Fawr Valley, in Brecknockshire, situate on the old red sandstone formation, about thirty miles from Cardiff.

In order to meet the pressing needs of the town, another large storage reservoir was commenced at Llanishen in 1884 and completed in 1886, this adjoining the existing Lisvane reservoir, and being capable of holding 300,000,000 gallons of water.

New filter beds for efficiently filtering 3,000,000 to 4,000,000 gallons per day on the most approved principles were built near the "Heath," 1½ miles from Cardiff, at the same time as the storage reservoir at Llanishen, and these had since been enlarged.

In the meantime the Act authorising the works in the Taff Fawr Valley was obtained, and two new reservoirs, with a capacity of 668,000,000 gallons, were constructed in the new watershed and the necessary mains laid between those and the Cardiff works, while a third reservoir of a capacity of 1,200,000 gallons was in course of construction until recently, but operations had for obvious reasons been suspended for the time being.

In the Taff Fawr Valley the corporation had one of the finest watersheds in the kingdom, with an abundant supply of pure soft water, eminently suitable for all domestic and manufacturing purposes.

The effect produced on the public health of the district by the various public works which have been constructed might be seen in the reduction of the death rate which has taken place.

HIGHWAYS.

The streets of the city were wide, well kept, and in ordinary times exceedingly well lighted. The total length of highways in the city was now 135 miles. The carriageways of the main thoroughfares were wood paved or asphalted and the remainder macadamised, and the footways were well flagged. About 32 miles of electric tramways, the property of the city council, were laid along the main thoroughfares.

OPEN SPACES.

Until the year 1888 the city did not possess a single park or open space of any description. Since then, however, the corporation had acquired, partly by gifts and partly by purchase, a large number of parks and open spaces for the free use of the public, and at the present time could fairly claim in this respect to have done its duty to the public, and there was no work of the city council which was more appreciated.

CIVIC CENTRE.

Cardiff could safely claim, in the matter of town planning, to have the finest civic centre in the United Kingdom and to have set an example to other cities worthy of being followed.

Owing to the abnormally rapid growth of the population of the city in the latter part of the last century it would be readily understood that all the public institutions had become too small for the proper carrying out of the work, and proposals of various kinds were made for the better accommodation and better buildings in which to carry on the public operations of the city with the result that in December, 1898, the Cathays Park, comprising some 60 acres of land, was acquired from the Marquis of Bute for the sum of £160,000, and since then there had been grouped on the site the city hall, law courts, the University of Wales Registry Offices, the Glamorgan County Offices, the first section of the University College of South Wales and Monmouthshire, the new Technical College, and now in course of erection was the first section of the National Museum of Wales. A site at the north-west corner of the park had been granted to the Government for the erection of a fine block of Government buildings, and these would have been in course of erection now but for the outbreak of war.

The land was not yet all appropriated, and there were still some excellent sites available for such further public buildings as might be required; but what had been done on this site in the matter of public buildings in the first eighteen years would, he thought, be acknowledged as a fine achievement.

Having been associated with the city in the capacity of public servant of more or less importance during the last forty years of these extraordinary evolutions of the city, he thought he might justly feel some amount of pride in the part he had played in the building of the city, and in bringing into being the metropolis of Wales.

HOUSING AND TOWN PLANNING.

SCOTTISH LOCAL GOVERNMENT BOARD'S REPORT.

The partial suspension, owing to the war, of the customary operations under the Housing Acts is one of the matters touched upon in the annual report of the Local Government Board for Scotland. The Board point out that the stagnation applies not only to municipal schemes, but also to private building enterprise, with the result that, despite the large exodus of men due to enlistment, the demand for working-class houses is still pronounced. Consequently, the board have advised local authorities to endeavour to secure the repair rather than the closure of houses, except in cases where closure is urgently necessary for the removal of nuisances or the protection of health.

While it is impossible to predict when the work of housing may be resumed, it is conceivable that the cessation of hostilities may suggest the initiation of schemes. Accordingly, the board are of opinion that where a scarcity of housing exists local authorities should be prepared to put work in hand immediately the occasion so demands. To that end probable sites should be considered and their lay-out determined. The number and character of houses required should also be estimated and plans prepared. The board are ready to assist so far as their resources permit.

The Board acknowledge the effective co-operation of local authorities in solving problems in particular districts in regard to the accommodation of war workers, and mention that practically throughout the year the department's housing staff were engaged upon work of this nature.

The war also necessitated a general curtailment of activity in town planning, and the question was left almost entirely to the discretion of the local authorities. The board gave authority to the preparation of schemes by the local authorities of the burghs of Ayr, Edinburgh (Murrayfield, Camby Bank, &c., area), and Kirkcaldy. Eight applications for authority to prepare schemes were received during the year from the local authorities of the Middle Ward District of Lanarkshire (Cambuslang and Carmyle areas), the Lower Ward District of Lanarkshire (Burnside area), the Upper District of Renfrewshire (Easter Renfrew area), and the burghs of Ayr, Edinburgh (Duddingston, &c., area), Glasgow (Kennyhill and Riddrie area), and Rutherglen.

Road Damage in Cornwall.—In reference to a complaint by the Camborne Urban District Council of damage to roads caused by heavy tractors, the Highways Committee, with a view to avoiding litigation, suggest a settlement by the company concerned making use of lighter tractors and paying 3d. per ton per mile for traction-engine traffic.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed.* All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. *Unless these conditions are complied with we cannot undertake to reply to queries.*

QUERIES AND REPLIES.

In order to avoid confusion queriets are requested to use distinctive words as nome de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

HIGHWAY REPAIR: MOTOR TRAFFIC. "Urban" writes: This council has recently been requested by a large farmer to repair which practically means reconstruction a certain section of road, 6 furlongs 7 chains in length, at the extreme boundary of the district, and end of an old metalled highway upwards of 6 miles in length, in order that he can utilise the road for heavy motors for carrying his produce—chiefly potatoes—from his farms to a railway station, 7 miles distant. The road is practically a cul-de-sac, there being no continuation beyond the point of termination near his farms. Hitherto, from time immemorial, the section of road has been maintained and kept in a condition sufficient for the traffic of the district, which is purely agricultural, and no question has previously arisen in regard to the section of road being kept otherwise than in a satisfactory condition. In the early part of the current year a heavy motor, with trailer combined, commenced to use the road, carting farm produce as above mentioned, and within six weeks had done more damage than the ordinary traffic of the district had done in the previous three years. In fact, it made the road wellnigh impassable. Repairs have been carried out since the damage was done, and the farmer in question admits the road is again all right, but contends it will not be of sufficient strength for his heavy motor traffic when it commences again, which will be very shortly. (1) Is this council compelled by statute or otherwise to reconstruct the section of road as requested for such traffic, the cost of which will be not less than £500? This would mean a supplementary rate of 10d. in the £ upon the rural area of the urban district, owing to such an expenditure not being provided for in the estimates for current year, which were passed in March last by the council; (2) can any portion of such sum be recovered by the council towards the cost of such work if carried out; (3) can the council recover the cost or any portion thereof for damage done by such heavy motor traffic if continued in future? The road in question throughout its entire length has never been maintained in a condition for carrying heavy motor traffic, it being generally narrow and not more than 10 ft. 6 in. wide at any point. Further, such heavy motor traffic hitherto had never been contemplated upon the road.

(1) It is the duty of the council to keep the road upto-date (*i.e.*, in a reasonably fit state to bear the traffic (including motor traffic which may reasonably be expected to come upon it. See *Cheshire Corporation* v. *Foster* (1906, 1 K.B., 167). (2) If the road was in a good state of repair, sufficient for the ordinary traffic, prior to the commencement of the motor traffic, I think the council could recover from the person by or by whose order such traffic was conducted the extra expense attributable thereto. (3) If the road is put into a state reasonably fit to bear the expected motor traffic, then, in the event of such traffic exceeding reasonable limits, whether by reason of excessive weight, frequency of journeys, or otherwise, the council would probably succeed in recovering at all events some portion of the damage.

BUILDING BY-LAWS: AIR SPACE.—"H. B. C." writes: Plans have been submitted for a proposed cottage and the amount of air-space allowed has been the source of some trouble. The cottage is to front on a narrow and old roadway, which was laid out before the by-laws were made by the council. This road has been considered as a street, 17 ft. in width, and therefore requiring the space in front of the cottage to be 20 ft. 6 in. This width is not obtained opposite a projecting part of the house on the opposite side of the road. Should this width be also 20 ft. 6 in. or less, owing to the road being narrower (10 ft. 6 in.)? The plans have been altered to show part of the wall of the washhouse immediately opposite this projection set back to give a width of 17 ft. 3 in. Do you consider this alteration would make the plan in order as regards front space? With regard to the space in the rear, this is only about 5 ft., but from the proviso (c) in enclosed revised by-laws it appears that space cannot be required in the rear if provision is made at the sides. The required depth of space (16 ft. for a house 25 ft. high) is not given over the whole depth of space on one of the sides. Would the proposing builder be correcting this by altering the position of part of back wall?

As to the front space. The first part of by-law 3 refers to the width of the street *at the point where such building may front thereon*, and although these words are not repeated in the subsequent part of the by-law, I think that, upon a reasonable interpretation, where (as in this case) a building fronts on a street of varying width, the prescribed distance may vary at different parts of the building, being measured having regard to the width of the street at the point of measurement. I think, therefore, that the proposed alteration would make the plan in order as to the front space. As to the side space: I think that the proposed alteration of the back wall would make this space in order.

HIGHWAY RETAINING WALL. DANGER TO CHILDREN. "YNYS" writes: My council's attention has been called to the danger involved to young children by their climbing a retaining wall adjoining a highway in this urban district, and sitting with their legs over the precipice on the outer side, and also in walking and running along the flat coping. And it is also suggested that in case of a serious accident to a child, or children, the council could not escape blame or responsibility in the matter. I shall be obliged if you will kindly advise whether the council could be in any way held liable or responsible in case of accidents, seeing that the wall is 4 ft. 6 in. high from the surface of the road, and in good condition.

It is impossible to express a decided opinion upon a hypothetical case. A great deal would depend upon the particular circumstances, and the view taken by the judge and the jury (if any) with respect thereto. But, assuming that the wall forms part of the highway for the purpose of repair, I think it is highly probable that, in the event of such an accident as suggested, the council would be held liable, especially as their attention has been called to the matter.

HIGHWAY: STRAYING POULTRY. "S. R." writes: I shall be glad if you will kindly give me your opinion as to the following: A man keeps poultry in a field alongside a narrow public highway and very frequently they wander over the road and are a danger to anyone cycling along, and one or two persons have been thrown from their machines by the fowls flying across and coming into contact with the motor cycle. (1) Can the authorities compel him to keep his poultry off the road; (2) can any person who is injured in consequence of the poultry recover damages; (3) if any of the hens are killed by a motor car can the owner of the poultry sue the motorist for damages?

(1) There appears to be no duty on the part of a landowner to keep poultry off the highway, or to fence his land to prevent them from escaping, and no means of compelling him to do so. (2) I do not think any person injured in consequence of poultry being on the road could recover damages. See *Hadwell* v. *Righton* (1907, 2 K.B., 345). (3) This would depend upon circumstances. The owner would, I think, have to prove gross negligence on the part of the motorist in order to succeed.

NUISANCE BY NOISE: PROCEDURE TO REMEDY. "YNYS" writes: A field adjoining a chapel in this town is being let for circuses, shows, &c., and the chapel authorities complain of the nuisance thereby caused by noise, &c., interfering with the conduct of the week-night services. Will you please advise me what remedy there is to get the nuisance abated, and how to proceed?

The question whether noise amounts to a legal nuisance is always a question of degree, and depends partly upon the character of the neighbourhood. The remedy is by proceedings in the Chancery Division of the High Court for an injunction. The following have been held to be legal nuisances, and injunctions have been granted in respect thereof: A circus near a house, performing three hours every evening for eight weeks (*Inchbald* v. *Robinson*, L.R., 4 Ch., 388); merry-go-rounds near a house (*Lampton* v. *Mellish*, 3 Ch., 163); a rifle-gallery, organ, and roundabout near a house (*Winter* v. *Baker*, 3 T.L.R., 569); horse-racing on Sundays (*Dowd* v. *City and Suburban Racecourse Company*, 1899, 1 Ir. R., 345).

Institution of Municipal and County Engineers.

ANNUAL GENERAL MEETING AT BLACKPOOL.—(4.)

At the recent annual meeting of the Institution of Municipal and County Engineers at Blackpool, Mr. W. H. Schofield, Assoc.M.Inst.C.E., submitted for the consideration of the members a paper entitled:—

IMPROVEMENTS OF HIGHWAYS TO MEET MODERN CONDITIONS OF TRAFFIC.

The paper is reproduced on another page of this issue.

Mr. C. F. Gettings (Worcestershire) proposed a hearty vote of thanks to Mr. Schofield for his paper. He thought Mr. Schofield had given many of them credit for knowing more than they did, and he was sorry that he had not, in his paper, given them a little more of his experience with some of the material he had laid under the very heavy conditions of traffic which existed in Lancashire. Outside London he looked upon Lancashire as one of the heaviest traffic counties, and he could only put it down to Mr. Schofield's modesty that he thought the information would be rather unnecessary. Personally, he would be only too pleased to learn a little more of his experiences. Speaking as a county man, he could say that those who had large mileages of roads to deal with, and practically with no foundation, knew what it was when they got new traffic such as they had had during the past two or three years—he was referring particularly to motor omnibus traffic. He was afraid in many boroughs and urban districts they did not appreciate the difficulties the counties were working under, because in the urban districts and boroughs they had from time to time built up a stronger foundation, not necessarily a pitched foundation, but they had added considerable quantities of street metal which had strengthened their roads, so that the traffic which had come upon them suddenly had not affected those roads as it had the county roads. The question of rubber tyres had been mentioned. He looked upon that, especially for the counties, as a most important thing. Possibly a little experience he had had in his own county would rather substantiate the view of an owner who worked a number of these vehicles. Some five years ago he had to take up mechanical traction in order to carry the large quantities of material they now required. They did not own all their own vehicles, but they hired at that time about six lorries, all of which were steel tyred. For two years he watched the effect of these lorries. They had to work them in the winter time to get the material in; they could not work in summer. Unfortunately, the lorries had to work on weak roads, and he found their roads were cut up worse by their own traffic than any other traffic they had to carry. He went into the matter with the man who was supplying the vehicles, and he had two of the lorries fitted with rubber tyres. The man said: "I shall want an extra 6d. per ton." After watching the effect of the rubber tyres on the road, he said: "Now I am going to stipulate that the whole of your machines are tyred with rubber." He said: "You will pay me the extra?" to which he replied: "Not a penny." The man jibbed a bit, but eventually he accepted. Two years later he put an extra six on the road. The man was now running eighteen vehicles, all rubber tyred. He was tyring his vehicles with rubber because it paid him on the mileage. He thought that contractor was making money. In the paper Mr. Schofield referred to the Statistics of Traffic (Summary Form) issued by the Road Board. Mr. Schofield did not say in what respect his form differed from that of the Road Board It would be useful if he could give the information so far as Lancashire was concerned. Mr. Schofield referred to hand-pitched foundations. He thought they would all agree that the hand-pitching of the foundation was the proper thing to do, but the cost was very considerable, and he was afraid that very few of them could entertain that, although they would like to. In his county they were doing a large amount of strengthening work. They were using principally slag, which was the local material, in size from 4 to 8 in., and they were putting that on with forks. They had had occasion to break that slag up at times, and it was astonishing how that material had gone together. It was just like iron itself. If they kept the material of a suitable size it was hardly necessary to do more than that, unless it was an exceedingly heavy traffic road. They were getting from 1,000 to 2,000 tons of traffic per day, and he had roads which were carrying more than 2,000 tons per day. Mr. Schofield referred to the use of tarred iron slag macadam. He was pleased to say that Mr. Schofield's experience agreed with his own, but he thought there Mr. Schofield had not given them any data. It would be useful if he could give them the width of the road, the tonnage per day, whether it had a good foundation, the class of traffic, whether motor 'bus or motor lorry, and the cost. He did not think it was fair to shoot these questions off hand, and he had previously written to Mr. Schofield and asked him to give figures. There was one other point. Mr. Schofield referred to Durax paving. Now, Mr. Schofield had had considerable experience with tar-macadam, and it would be advantageous if he could give them any information as to when he considered it was better to abandon tar-macadam and adopt either a Durax or a sett paving. There was one other question as to tar-macadam, and a very important one—that was as to renewals. Mr. Schofield had had a number of years' experience of tar-macadam, and he anticipated that he had had to renew some of it; if he had not, then he was very fortunate. Mr. Schofield's views as to the best methods of renewing a tar-macadam surface would be very useful. He had put down tar-macadam on roads, although he knew they would have a heavy traffic. He wanted to get the bottom of the road right first. If they got the bottom right and consolidated, they could at a later date apply a better surface material. They had gained experience with different kinds of material coming on the market, and perhaps Mr. Schofield had experience of where he had to renew his tar-macadam with some other kind of material.

Mr. S. S. Platt (Rochdale), who seconded the vote of thanks, said he agreed entirely as to substituting sett pavement as the most economical in the long run for roads which were subject to heavy traffic, but he would like to ask Mr. Schofield whether he had found any difficulty through having a rigid foundation and the heavy motor lorries with iron wheels fetching off pieces of the granite. He did not mean fetching the corners off, but actually smashing them up. If anybody had asked him a few years ago, he would glibly have given them the life of a granite sett paved road, but he would not do so to-day. He would like to ask Mr. Schofield whether he had any experience of providing a resilient bed between the concrete and the setts or whether the only remedy was to apply rubber tyres. There was no doubt about it that with iron tyres they would get the weight resting on points, and that was where the fracture took place. He had not read that Mr. Schofield had any experience of Rocmac in surfacing roads, and whether there was any interstitial wear. His experience was that it was ground down at the top but below it was as hard as concrete. He had some experience when he had to have some scarified out. It nearly pulled the inside of the machine out. He quite agreed as to tar-grouted macadam; they had only a varying degree of success. As to Durax paving, he had always been against it, because for one or two shillings a yard more they would get a proper pavement. He quite agreed that the old rule as to the width of 8 ft. for each line of traffic was insufficient, and where there was no regulation of traffic even 9 ft. 6 in. between the kerb and the tramway was not sufficient. He did not know whether Mr. Schofield thought there should be some legislation, because it had got to be a very serious matter.

Mr. H. G. Whyatt (Great Grimsby) said Mr. Schofield had called attention to the growth of traffic on the Liverpool and Manchester road. He was specially interested in that because he lived just off that road for thirty years. Looking at the figures it struck him that a great change had come over it in the last five years. The first figure was 1,104 mechanically propelled vehicles in seven days, carrying 2,236 tons; that was approximately 2 tons per load. This year they had, in seven days, 2,953 mechanically propelled

vehicles, carrying 15,715 tons, which was approximately 6 tons per load, showing that the road was coming very much more into use for heavy traffic. Between Liverpool and Manchester there were two or three railways, the Bridgwater Canal, the Ship Canal, and, possibly, other means of conveyance. The people who brought goods by those methods, whether by railway or canal, had to pay freightage on those goods. The owners of motor vehicles had found that if they brought those goods by road they had to pay nothing towards the cost of the road—that was paid by the highway authorities. That traffic had grown to such an enormous extent that the time had come when there should be some means of making the owners of those vehicles pay towards the cost of the roads over which they travelled. On other roads, for instance, the Preston and Blackpool road, where five years ago the load was nearly 3 tons per vehicle, it had gone down to 2¼ tons. That was the converse. On the figures of the loads on the Preston-Blackpool road there was very little to be said, but on the figures of the traffic on the main road from Manchester to Liverpool there was a good deal to be said, for Mr. Schofield's contention that the motor vehicles ought to pay towards the cost of the roads.

Mr. W. J. HADFIELD (Sheffield) said in Sheffield they had a good deal of experience with heavy traffic, and he quite agreed with Mr. Schofield that tar-macadam was among the best materials for holding up to traffic. They had 1,000,000 sq. yds. of tar-macadam in Sheffield, all of which they had made themselves. He ventured to say that 990,000 yds. of it was in good order and a success. He was not the pioneer of this paving; it was laid down by Mr. Wike and his predecessor. It had been laid down twenty years and they had never seen the bottom coat. On the roads on which tar-macadam was not suitable the theory in the past had been to lay setts. The economy of setts was disappearing. The steel-tyred vehicles in particular played havoc with them, and while they used to ask for twenty years for loans for setts they now asked for only fifteen years. That spoke for itself. One of their heaviest traffic roads, the road between Sheffield and Rotherham, was laid part with setts and part with tar-macadam and the tar-macadam was wearing best.

The PRESIDENT (Mr. J. S. Brodie): Is it slag tar-macadam?

Mr. HADFIELD: Yes. The time was coming when these steel-tyred heavy motor lorries would disappear and rubber-tyred vehicles take their place. They had a reinforced concrete road with an asphaltic surface on it. They were going in for 8 in. thick of concrete with British reinforcement and 2 in. of asphaltic surface, according to the traffic. He was quite convinced that where there was heavy traffic they must have some binder to seal the surface of the road. The question of street watering and its effect had been referred to. The proper thing was to get the dust off the street, which they could do with a smooth surface.

Mr. H. T. CHAPMAN (Kent) said he had the pleasure of serving under Mr. Schofield in Lancashire for ten years, and he knew that the conditions in Lancashire, both as regarded traffic and characteristics generally, were as varied as any other county in the country. He also knew Mr. Schofield was as solid a county surveyor as any they had, and he did not speak hypothetically. Mr. Schofield had given some details of the great increase in mechanically propelled vehicles on certain roads, but he did not tell them the proportion of the mechanically propelled loads to the total traffic. He found in Kent something like 60 per cent in volume of the traffic was motor propelled. Mr. Schofield mentioned a hand-pitched foundation. He would like to know if he put any material in the pitching such as ashes or clinker, because he remembered when he was in Lancashire they had a very great deal of difficulty with the Preston road—the portion which was in the borough. However large pitching they put in, clay came up through it. He thought they must have some more homogeneous foundation than hand pitchings. On a clay foundation the pitching was working down and the clay was working up. As to Durax paving, the one thing to be said for it was that they could lay it upon the old macadam surface. Unless they had Durax paving on concrete they would have trouble with it." They must have the paving held up to the traffic, but he would not say rigid, because in his opinion it was very desirable to have a certain amount of resiliency to prevent the large amount of compression of heavy traffic. With regard to road widenings, he was with Mr. Schofield all the way. He thought many of the road widenings and improvements had been dangerous. They had made for greater speeds, and thus led to more danger. He should like to mention street watering. Except on very rare occasions, street watering was not necessary for maintenance purposes, it was water for destruction. In his county they refused to contribute for watering roads which had been tar-painted, and for bituminous surfaces it was unnecessary and more destructive than beneficial.

Mr. W. FINCH (Cumberland) said that in Cumberland they had laid a considerable amount of tarred granite, which came to them prepared from the quarries. He would like to ask whether that was the case with the tar-macadam Mr. Schofield used, or did he mix it himself? The fault with the tar-macadam he had used had not been with the granite, but with the tar. On certain roads, where the conditions were exactly similar, and the stone was mixed in the same way, one had roads which had been made five or six years with an excellent surface, but other portions had worn out on the surface in from twelve to eighteen months. That was the fault of the tar, and something ought to be done by the distillers or others who were producing tar to give them a thoroughly reliable tar for all purposes. With regard to the tar-grouted section they had laid, it had been more successful than the tar-macadam. He had a section which was laid on the road carrying the heavy traffic from Gretna. That was tar-grouted, and had stood very well.

The PRESIDENT: What kind of granite are you using there?

Mr. FINCH said in his case it was Threlkeld granite. With regard to widenings he thought these ought to be encouraged. In order to encourage the local authorities the Cumberland County Council had given grants in every case where a road in junction with a main road was widened, and before the war they had many of these widenings. He thought it would be much better if the aldermen and councillors of their authorities were present at these meetings, because at present they said they would only spend a certain amount of money on the roads. Instead of encouraging the authorities to make a good job by putting down good roads the Government cut down his estimate by one-half, so the Government were to blame in that case, as they might have assisted the county council in that direction, as the life of the road would have been increased.

(To be continued.)

Street Watering with Electric Vehicles.*

By JAMES BEE, Cleansing Superintendent, Blackpool.

At some of our previous conferences we have had discussions respecting the introduction of electric vehicles for municipal work, and for some time I have been convinced that for our town to be really up to date it was necessary that the work of street watering should be carried out by means of a motor vehicle; but what I wanted was something which would not only carry out the work efficiently and economically, but a vehicle smart in appearance, and in keeping with Blackpool's motto of "Progress."

In the electric street-watering vehicle which we obtained last year, we have obtained one which I have no hesitation in saying meets both these conditions. Since it was placed on the streets it has been the object of many complimentary remarks from both residents and visitors, and I am safe in saying that we have never had any machine come into the town which has been so much appreciated, and which has given such satisfaction as this vehicle has done. I think those present will agree with me when I say that no better evidence could be required as to the vehicle having given the utmost satisfaction than the action which my committee have recently taken in ordering another identically similar machine, after less than twelve months' experience.

Blackpool's Electric Street-watering Vehicle.

Although petrol motors had been very extensively introduced into municipal work, the electric vehicle for heavy work was practically unknown. It was therefore rather a bold stroke, and a little risky, to assume the responsibility of recommending the expenditure of nearly £1,000 on the purchase of an electric vehicle for street watering purposes. However, it is necessary for someone to experiment if we are to make any progress at all, so, after very careful consideration, the chairman and myself decided to urge the Cleansing Committee to obtain an electric vehicle.

The work of street watering is one of the most important duties which a cleansing superintendent has to perform, and one which causes him no little anxiety; and it is essential therefore, if he is to give satisfaction, that he should be provided with the most up-to-date appliances. Not only is dust a great nuisance to the shopkeeper in spoiling the goods he has displayed for sale, but it constitutes one of the greatest factors in the spread of infectious disease, and one of the worst dangers to the public health. Not only with reference to street watering, but to other duties carried out by cleansing departments, it should be remembered that the nature of the work is such as to be absolutely necessary for safeguarding the health of the people, and that any money spent on its equipment is money well invested.

Whatever regard we still cherish for the horse—and no one will undervalue the work it has rendered in the past—we cannot allow sentiment to impede the march of progress. When we see the motor-watering vehicle moving along doing its work at the same speed as the quickly moving vehicular traffic, we at once realise how utterly out of date the slow-moving and cumbersome horse-drawn vehicle really is. Further, there is no "jibbing," or going dull to work, as we often experience with horses that have had a few hard days' work; or resting days because they have not been eating their food; or of stopping in for shoeing; all of which invariably happen during the worst dusty days when watering is urgently required. Not only does the horse-drawn watering cart interfere with the traffic owing to its slow speed, but an excessive quantity of water is put on the roads, and it becomes a mere water waster. Excessive watering is not good for any class of road, and especially so with regard to macadam roads, of which we have a great percentage. Macadam roads, watered excessively with salt water, become dirty for pedestrians, while the vehicular traffic plucks up the metal and damages the road. With the motor this is avoided, as only sufficient water is put on the road to lay the dust, and as we have not had a single complaint this year, I think we can take it for granted that the work has been efficiently carried out.

Our electric street-watering vehicle was obtained in July of last year from the General Vehicle Company, Limited, Imperial House, Kingsway, London, at a cost of £974. The chassis is a 3½-tons one, and is 18 ft. 6 in. long and 6 ft. 9 in. wide. The wheels are fitted with solid rubber tyres, the front ones being single and the back ones twin, and are chain-driven. The tank, which is cylindrical in shape, has a capacity of 750 gallons, and is fitted with sleeve valve sprinklers. The spray operates at the front of the vehicle, this making it easier of control by the driver, as there is no necessity for him to turn his head to see where the water is going. With fast-

* Paper read at the annual conference of the Institute of Cleansing Superintendents, held at Cardiff.

moving vehicles this arrangement is of the utmost importance. There is a large pump provided, as the pressure of water at the Hydrical tank produces a spray sufficient to water a street 7 yds. wide.

The batteries for providing the motive power are by the Exide and consist of forty-four cells. We have installed apparatus for the purpose of recharging the batteries from our refuse destructor electric plant. By this means we are able to obtain the power without any cost to the department, and in my opinion this constitutes a very convincing argument in favour of the electric vehicle in preference to its petrol-driven competitor. With the present high price and scarcity of petrol, we are now certainly reaping considerable benefit by having decided in favour of the electric vehicle. The recharging of the batteries is carried out during the night, and takes about six hours to accomplish. When the batteries are fully charged, the current is automatically cut off. Although the vehicle is supposed to travel 40 miles at one charging, with ordinary work, it must be remembered that in street watering you have always to travel with a no load out, and it cannot be compared therefore with a vehicle taking a load a long distance and returning empty at one charging. Another point which must be taken into consideration is that the vehicle is called upon to move a great weight during the course of the day, and in addition to this it is loaded up many times, and, as is the case with vehicles of any description, it takes extra power to start it. Under these circumstances we have never run the vehicle more than about 30 miles without it being boosted up, although if we had desired to do so we could have run it a few more miles; but it is not wise to run the batteries too low. The general course adopted is for the vehicle to turn out in the morning and work about five hours. During this period it waters about 25 miles of streets, using fourteen loads (about 9,100 gallons) of water. During dinner-time it is given a boosting charge of about 1½ to 2 hours' duration, and it then goes out for the afternoon, completing the day's work. By this means there is no danger of running the batteries empty, and being unable to return to the depot. So far we have never had the slightest difficulty in this respect, and if the driver will only keep an observant eye on the meter, he will run no risk whatever of being stranded. I would like to state here that we have found the electric vehicle easy to drive, and an ordinary horse driver can be taught in a few hours, providing, of course, he is intelligent, and capable of picking up a little knowledge of machinery. It is also important that the man should have a thorough practical knowledge of street watering if he is to be a success. It is of little use having a good machine unless it is in charge of a capable man; one who will take an interest in looking after it, and at the same time get as much work out of it as he can.

Turning to the actual work which the vehicle is capable of accomplishing, and when all is said and done this is what really appeals to us, and what the members will desire to know, it is rather unfortunate that we only obtained the vehicle in the last week of July, as I should have very much liked to have placed before you a full watering season's results. The figures which I shall place before you will be, I hope, just as convincing, as they refer to what the vehicle has actually done under ordinary working conditions during April and May of this year, compared with the same two months of last year.

I might mention that the cost of power in the following figures is worked out on the basis of 1½ units per mile.

STREET WATERING DURING APRIL AND MAY, 1916.

	Electric vehicle.				Horse vans.		
	Days at work.	Hours worked.	Miles watered.	Gallons of water.	Days at work.	Hours worked.	Gallons of water.
April ..	21	115	57[illegible]	192,750	14	90	57,750
May ..	24	144	[illegible]	232,050	15	289½	165,450
Total ..	45	259	130[illegible]	424,800	28	379½	223,200

Number of days on which streets were watered ... 45
Total number of hours worked 638½
Total gallons of salt water used 648,000

STREET WATERING DURING APRIL AND MAY, 1915.

	Corporation carts.			Hired carts.		
	Days at work.	Hours worked.	Gallons of water.	Days at work.	Hours worked.	Gallons of water.
April ..	21	717	381,300	14	122½	67,900
May ..	27	1,515	820,750	22	326	172,550
Total ..	48	2,232	1,205,050	36	448½	240,450

Number of days on which streets were watered ... 48
Total number of hours worked 2,680½
Total gallons of salt water used 1,445,500

COST OF STREET WATERING TO MAY 31ST (2 months).

		£ s. d.	£ s. d.
1916—			
Wages—Motor driver ...		8 7 4	
Horse drivers ..	...	10 3 0	
Hire of horses from highway dept.		10 5 10	
Depreciation—Vehicle ...	£12		
Batteries .	£8		
Tyres ..	£4		
		24 0 0	
Sundries—Insurance, oil, &c. ...		2 10 0	
Power—1,902 units at 1d. ...	...	7 18 6	
Water	...	16 3 0	
			79 7 8
1915—			
Wages—Horse drivers ...	...	58 12 8

Hired carts (horses and drivers) ...		19 10 5	
Water	.	36 2 9	
			174 14 10

Total saving on the two months—£95 7s. 2d.

In my opinion, the electric vehicle is quite capable of doing the work of six horse vans, and as it might be of interest to the members, I have estimated what the saving would be per week (5½ days) on this basis.

COST OF ELECTRIC VEHICLE PER WEEK.

	£ s. d.	£ s. d.
Driver's wages	1 15 0	
Power—384 units at 1d.	1 12 0	
Depreciation...	2 10 0	
Sundries, insurance, oil, &c. ...	0 6 0	
Water—84,500 gallons ...	2 2 3	
		8 5 3

COST OF SIX WATERING VANS PER WEEK.

	£ s. d.	£ s. d.
Six drivers' wages at 29s.	8 14 0	
Hire of six horses at 27s	8 2 0	
Water—173,000 gallons .	4 6 3	
		21 2 3

Estimated saving per week—£12 17s. 0d.

The following figures represent the actual work accomplished by the vehicle during a recent week, including Saturday afternoon and Sunday morning.

Day.	Miles watered.	Hours worked.	Loads of water.	Gallons of water.
Monday ...	16[illegible]	9	24	15,600
Tuesday	15[illegible]	9	24	15,600
Wednesday ...	14[illegible]	9	23	14,950
Thursday . ..	14[illegible]	9	23	14,950
Friday ...	16[illegible]	9	23	14,950
Saturday	45[illegible]	9	22	14,300
Sunday ...	5[illegible]	5½	14	9,100
Total	3[illegible]	59½	153	99,450

As an illustration of what the electric vehicle has saved in week-end street watering alone, it has only been found necessary on Saturday afternoons to have the vehicle at work, while on Sunday mornings we have one horse van at work in the extreme south end of the borough, all the rest of the town being watered by means of the electric vehicle. I might mention that under similar conditions in former years it would have been necessary to employ twelve to fourteen horse-drawn vans.

Before leaving the question of figures, I should just like to refer to one other example of how the vehicle has already effected a considerable saving. It has been our practice during the season to employ a gang of men during the night to swill the promenade; but, being short of men owing to enlistments, I was unable last summer to adopt this method. However, I found

that by means of the electric vehicle the work could be quite as efficiently carried out; as we were able to swill the whole length of our promenade each morning by this means. In addition to a considerable economy in labour there was a saving of about £50 in water alone.

However excellent a vehicle may be for street watering purposes, it will not be a success unless there is every facility for quick loading, and I am pleased to say that in our town we are exceptionally well placed in this respect. We have now salt-water mains laid to all parts of the town; the council have recently extended them at a cost of £7,000. From the main which runs the length of our promenade the electric vehicle can load in about five minutes, while the average time for loading in any part of the town is about ten minutes. Nothing but salt water is used for watering and washing streets, and flushing gullies and sewers.

Although the machine was obtained for street watering, its usefulness is not confined to that sphere of work alone, as it has already during the past winter been employed for the purpose of sewer cleansing. With a flush of 750 gallons the sewer is in most cases thoroughly cleansed, the vehicle being provided with a special valve for this work. In many cases it has saved us the trouble of having to resort to dredging operations, which are both slow and costly.

In conjunction with a Laffly motor sweeper, the electric vehicle has also been extensively employed on street washing operations; the two motors doing the work rapidly and efficiently.

As stated earlier in my paper, the present electric street watering vehicle has given us such entire satisfaction that the Cleansing Committee have ordered the same firm to supply a further vehicle, similar in every respect to the first one, at a cost of £1,028. This will enable us to dispense with horse-drawn vans entirely, as by means of the two electric vehicles we shall be able to water the whole of the town, which, for street watering purposes, will be divided into north and south.

In conclusion, I am fully convinced that the results obtained from the use of electric vehicles, not only in Blackpool, but in other towns as well, indicate that within the next few years great progress will be made by this class of vehicle, and that it will be extensively introduced into municipal work, for which it is so admirably adapted.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRY HELD.

Queenstown U.D.C. (July 4th. Mr. A. D. Price).—£600 for the completion of the duplicate water main from Tibbotstown. It was explained that a tender of £9,717 had been accepted in connection with the waterworks just before the outbreak of war, and that owing to subsequent delays and difficulties with respect to obtaining materials the expenditure exceeded the estimate. The proposed loan of £600 was for the purpose of discharging their outstanding liabilities. There were no new works of any kind. The works were completed, and since the day of completion the water supply, particularly to Haulbowline, had been most satisfactory. Haulbowline had got its full supply. Owing to the war the dockyard and Admiralty requirements had been substantially increased, and all the water required had been supplied without the least difficulty or delay.

APPLICATIONS FOR LOANS.

Wigan T.C.—£535 for pumping plant, £325 for electric cable, and £1,613 for constructional and pipe work.

Worcester T.C.—£14,000 for additional electricity plant.

LOANS SANCTIONED.

Branston R.D.C.—£350 for works of sewerage.

Hereford T.C.—£18,000 for electricity connections.

Upton-on-Severn R.D.C.—£1,541 for the extension of the Kempsey sewage disposal works.

FORTHCOMING INQUIRIES.

JULY.	£
25.—**Gloucester.** For works of sewerage (Mr. W. O. E. Meade-King) ...	1,606
26.—**Bristol.** For the purpose of a burial ground (Mr. W. O. E. Meade-King) ...	—

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Was not the paper read before the meeting of the Association of Managers of Sewage Disposal Works at Sheffield, by Dr. Sidney Barwise, the county medical officer of health of Derbyshire, an excellent *résumé* of the history of the sewage question, and did it not contain a vast amount of concentrated information? Is it not interesting to note the gradual change of scientific opinion on the proper method for dealing with sewage and the gradual evolution of thought that eventually discovered the importance of the proper application of air to ensure a pure effluent?

* * * *

Is not the London County Council to be congratulated on the financial success of their numerous working-class housing schemes if, as was stated by Sir John Benn recently, the loans on the various schemes are now nearly paid off and the renewals fund stands at £74,000? Did Sir John make any reference, however, to the land which had from time to time been purchased for large schemes which were afterwards abandoned and the land sold?

* * * *

Was there any occasion for the recent meeting of the Salmon and Trout Association to pass a resolution in favour of a Bill being brought into Parliament enabling an individual to take action against anyone who used crude tar for road making or mending? Have there been any authentic cases of fish poisoning arising from the application of tar or similar compounds upon roads where proper precautions have been taken to prevent its admission into a stream or river? Is not this fish-poisoning scare a bit of a "bogey"?

* * * *

Is it not to be hoped that everyone, of all ranks and classes, in the United Kingdom will respond cheerfully to the Government's demand for no Bank Holiday in August, and thus set a patriotic example to those who are engaged in the all-important work of the supply of munitions, and so help our brave men at the front? Is it not a well-known axiom that a multiplicity of units makes up the great whole, and cannot each citizen "do his bit" at this critical time?

* * * *

How are we to arrive at a solution of the problem as to what we shall do with our house refuse, when, on the one hand, local authorities are asking householders to burn their rubbish, and on the other hand there is a cry for the saving of paper, bottles and so forth? Could there not be a *via media* by which the householder could store the bottles and waste paper and burn what he could of the vegetable and other refuse, and the local authority make some arrangement by which they would periodically collect the bottles and paper on notification from the householder that there was a quantity sufficiently large to justify a special visit for clearance?

* * * *

Could not the general public greatly assist in wartime economies if they would follow a few simple rules? Could they not refrain from throwing paper, orange-peel, banana-skins and omnibus tickets on the surface of the streets and footpaths, see that no waste of water is taking place in their houses, refrain from sending trade circulars through the post, stop writing "chit-chat" letters, and generally try to think of how they can give as little trouble to anybody as possible?

* * * *

Was it not rather interesting to read the report of a discussion which recently took place at a meeting of the Salisbury Town Council on the question as to whether the expenses of their surveyor in attending the annual meeting of the Institution of Municipal and County Engineers should be paid? Whereas, on the one hand, it was urged that "the council ought to set a good example [in saving] and stop these annual outings," was it not, on the other hand, a very sound argument that it would be a good investment of the ratepayers' money for the surveyor to go and hear up-to-date papers read? Are not the council to be congratulated that the resolution to pay the expenses was carried by 16 votes to 2?

Some Results of the Use of Steam Tractors in Cleansing Work at Cardiff.*

By W. HARPUR, M.INST.C.E., City Engineer.

In March, 1904, the Cardiff Corporation purchased two steam motor wagons, and in the following September a further two, for the purpose of superseding horse-drawn wagons in the collection of house refuse from dust receptacles placed along the street-kerb lines by householders, or immediately inside the back garden doors where back lanes were available, the idea being that they would prove more expeditious and economical than horse wagons.

Each motor was fitted with a wagon body, and in addition two trailers were drawn behind, so that a train of three wagons was thus formed.

When collecting refuse the wagons were not brought to a stand, but travelled slowly along, the ashmen picking up the receptacles from each side of the street, and emptying them into one or other of the wagons as they moved along, which was a very laborious and somewhat dangerous occupation, the idea being that to work the steam wagons to the best advantage they should be kept moving.

In the early part of 1906 doubts were expressed by members of the council as to whether any economies had resulted from the new innovation, and I was asked to report on the matter to my committee after ascertaining the cost of refuse collection for a month (1) by means of the steam wagons, and (2) by means of horse-drawn wagons.

Accordingly, I caused careful accounts to be kept, as instructed by my committee, and on April 24, 1906, I reported as follows:—

"In accordance with your instructions I have had the cost of a month's collection of refuse by motor and by horse wagons respectively ascertained, and, after allowing interest on value of the respective plants, motors, horses, wagons, depreciation, repairs, and incidental expenses, I find that the cost of collection by motor works out at 2s. 4·25d. per ton, and by horse wagons at 1s. 8·81d. per ton, or the cost of collection by motor is 35·75 per cent more than by horse traction.

"Recently one of the motors broke down, which gave me an opportunity of a further week's test as to what was the cost of working the district usually cleared by the disabled motor by horse power. This showed the collection by motor wagons in the particular district for one week to be £14 14s. 6d., and by horse wagons for a like period £10 13s. 1d., showing that the cost of collection by motor exceeded that of collection by horses by 32·8 per cent. This approximates very nearly with the figures resulting from the month's trial, and makes a very useful additional test. If we had weighing machines at the different depots and tips, I should have been able to have given you more exact figures. The above results were obtained by weighing a given number of loads, and taking their weights as the average per load of the remainder, and although not absolutely exact, the weights arrived at are quite sufficient to give a very near approximation as to the relative cost of collection by the two methods.

"The conditions under which the motors are worked in Cardiff is not advantageous to their economical use, for the following, among other, reasons: The time taken up in parading the streets while collecting the refuse is largely a waste of time, and as the distance from the collecting ground to the tips is not great, the motors have no opportunity, in travelling to and from the tips, of making up by their greater speed for the time lost while collecting.

"Each motor is fitted with a wagon body, and in addition draws two trailers, so that it is always drawing two wagons in addition to the one loading, and the train (if it may be called so) has to travel about three times the mileage that horse wagons have to; consequently the wear and tear is proportionately greater, in addition to which the turning, shunting, and coupling up, and the higher speed at which they travel to and from the tips, all induce to the increased wear and tear of the plant over horse wagons. Again, the motor driver cannot assist in loading, as do the horse drivers, and therefore his wage is an entire extra to that of the horse wagons; in addition to which, on account of the heavier work with the motors, the motor ashmen are paid higher wages than the ashmen with the horse wagons.

"It is necessary in some instances to send a horse wagon into the districts worked by motors to pick up refuse in places which are inaccessible to the motors.

"The foregoing and other minor reasons, coupled with the greater initial cost of the motors and wagons, in my opinion, account for the motors not proving so economical. If the tips were several miles further away from the place of collection than they are, then I have no doubt the results would be very different."

Upon the presentation of this report I was instructed to go further into the matter with a view of reporting as to what in my opinion was the best means to adopt for the working or letting on hire, or otherwise utilising the motors to the best interests of the corporation.

I found some difficulty at the time in making a recommendation, as I was anxious to retain the motors in anticipation of finding useful and profitable work for them in the near future.

In the meantime, however, the dumping ground, which had been centrally situated and in near proximity to the cleansing depot, had been filled up, and a new tip had been secured 1½ miles further afield, and, consequently, on February 12, 1907, I presented a further report to my committee, containing the following information and suggestions:—

"I beg to report that I have given this question very careful consideration, and I am still of opinion that the work the corporation motors are doing is not profitable, and the question arises as to what better service they could be put to, or as to whether they should be disposed of. Personally, I am averse to the disposal of the motors, because I hope that, if not at present, at any rate in the near future, profitable work may be found for them. For the present, however, my recommendations would be to take the motors entirely off the work of collecting refuse, and in future to do this work by horse power. The collections from the central and docks districts I would recommend should be brought to Trade-street depot, and that one of the motors be employed for running the refuse thus collected from Trade-street to the new tip near the Penarth-road toll gate; this process, I believe, would be found more profitable than the present method of procedure. The collections by horse power having been brought to Trade-street, the horses would be transferred to empty wagons there in readiness, and the full wagons coupled up to the motor and conveyed to the tip."

The suggestion contained in the last report was acted upon. The refuse from the area nearest the cleansing depot was collected in horse-drawn wagons and brought to the depot, where the horses were taken out of the shafts and attached to empty wagons in waiting and despatched on collecting work, while four wagons were coupled together and drawn to the new tip by means of a motor wagon acting as a tractor, but with no body load.

After this method had been in operation for some time figures were gone into, and it was found that the conveyance of the refuse from the depot to the tip by means of horse-drawn wagons cost 1s. 9d. per load, but the same work when done by means of the motors, as described, cost 1s. 4d. per load, which thoroughly justified the new use to which the motors had been put.

In using the motors for the collection of refuse it was found that there were one or two disadvantages from which they suffered—for instance, there were certain places which were not accessible to a motor wagon, and consequently a horsed wagon had to be sent to these inaccessible places.

Again, in the rapid collection which was attempted, the loading being done while the wagons were in motion resulted in an undue amount of refuse being littered on the streets, necessitating a large amount of additional cleaning up.

* Paper read at the annual conference of the Institute of Cleansing Superintendents, held at Cardiff.

Still another disadvantage was found on the tip, for the motor could not approach the edge of the tip, and frequently became embedded up to the axles, and took some getting out, while the load had to be cast out where the motor stuck and removed to the face of the tip by other means.

In placing these few particulars before you please do not imagine that I am desirous of condemning the use of motors, whether they be steam, spirit, or electrically driven, for cleansing or other municipal purposes. My only desire is to point out that previous to purchasing such appliances a public official should make sure that the machine to be acquired is suitable for the work it has to perform, and that its adoption will result in true economy, not only to the particular department for whose use it is to be applied, but to the council as a whole, for it should be an axiom of every public official that one department of a council should not benefit at the expense of another—that is not true economy. . . .

In conclusion, may I venture, after eleven years' experience in the running of steam motor vehicles, to say that I do not consider any motor vehicle suitable for work where the loads have to be discharged on to a dump, as at Cardiff, and that, in my opinion, the following essentials are necessary in order to secure economical running of motor vehicles —viz.:—

(1) Rapid loading.
(2) Full loads.
(3) Reasonably long distance to run.
(4) A suitable place of discharge.
(5) Quick discharge.

With these essentials motor vehicles will unquestionably prove more economical than horses; without, the results must be considered, to say the least, as very doubtful.

PERSONAL.

Mr. W. J. Tait, borough surveyor of Sudbury, who is in the Army, has been promoted to a captaincy in the Royal Engineers.

Mr. D. Macalister, water engineer to the Greenock Corporation, has had his salary raised from £275 to £300 per annum.

The late Mr. F. W. Lacey, borough engineer of Bournemouth, who died on March 24th last, left estate of the gross value of £21,181.

Mr. W. G. Melvin, municipal engineer, Howrah, India, has been elected a member of the Institution of Municipal and County Engineers.

Mr. C. R. Cole, assistant county surveyor, Somerset, has been elected an associate member of the Institution of Municipal and County Engineers.

Mr. W. G. A. Clark, assistant surveyor to the Loftus Urban District Council, has been elected a student of the Institution of Municipal and County Engineers.

Mr. W. Greenwood, engineering assistant, Swindon Corporation, has been elected an associate member of the Institution of Municipal and County Engineers.

Mr. J. T. James, chief assistant county surveyor, Herefordshire, has been transferred to membership of the Institution of Municipal and County Engineers.

Mr. J. Temple Robinson, assistant to the county surveyor, Somerset, has been transferred to associate membership of the Institution of Municipal and County Engineers.

Mr. F. W. Tillotson, deputy surveyor and inspector to the Elland Urban District Council, has been appointed surveyor and inspector to the Birstall Urban District Council.

Mr. H. S. Goodall, engineering and surveying assistant, Edmonton Urban District Council, has been elected an associate member of the Institution of Municipal and County Engineers.

Mr. S. W. Richardson, engineering and surveying assistant to the borough surveyor of Eastbourne, has been elected an associate member of the Institution of Municipal and County Engineers.

Mr. Robert Gordon, King's Lynn, has been appointed road surveyor and sanitary inspector for the Easter Ross district of Ross and Cromarty, in place of Mr. W. Wyllie, appointed to Dundee. The salary is £280 a year.

Mr. E. Percival Mackay, of Chiswick, has been appointed chief surveyor's assistant to the Romford Urban District Council, temporarily, at a salary of £3 3s. per week. The surveyor, Mr. H. T. Ridge, is at present seriously indisposed.

Mr. H. C. Fread, surveyor to the Esher and the Dittons Urban District Council, has been congratulated by his council on the satisfactory result of the purchase made on his suggestion some four years ago of about 7,000 yds. of ballast lying on the Metropolitan Water Board's land adjoining the sewage works. At that time the council were proposing to erect new tanks and filters at those works, and the surveyor was of opinion that a considerable saving would be effected in their construction by the purchase of the ballast. The whole of it has now been used, part in the sewage works and part in the council's general work, and the remainder sold. As a result the council have made a profit on the transaction of £701.

Mr. E. W. A. Carter, who, as stated in a recent issue of The Surveyor, has been appointed city surveyor and waterworks engineer of Gloucester, received his technical education at the Gloucester Municipal Technical Schools. In 1890 he was articled to Mr. J. Fletcher Trew, architect and civil engineer, Gloucester, and whilst with him was engaged upon works of water supply, drainage, sewage disposal,

Mr. E. W. A. Carter,
City Surveyor of Gloucester

public baths and public and private buildings and factories. After spending a short time with Messrs. Waller & Son, diocesan surveyors, he became an assistant to Mr. R. Read, Assoc.M.Inst.C.E., city surveyor and waterworks engineer, Gloucester. In 1898 he was appointed assistant city surveyor, and in 1908 deputy city surveyor, and was directly responsible to the council for the work of the city surveyor's department in connection with the streets, health and improvement committees. The time during which he has been connected with this department has been one of great activity, and Mr. Carter has been intimately associated with all the works carried out. He is a member of the Institution of Municipal and County Engineers.

OBITUARY.

Lieutenant J. L. Peacocke, surveyor and water engineer of Newtownards, co. Down, has been killed in action. He was a native of Norfolk.

Lieutenant J. Lindsay Brough, Royal Scots, a member of the Edinburgh city architect's staff, who was previously reported missing, is now reported killed.

Mr. David Maebean, an architect in the Glasgow Office of Public Works, died suddenly on Saturday at Kingussie. He entered the service of the Corporation of Glasgow thirty-nine years ago.

Mr. James Pryde, road surveyor of the Western District of Kirkcudbrightshire, died, we regret to state, on the 9th inst. He had previously served in the road surveyor's office at Dunfermline, and was married only a year ago.

Mr. Singleton Goodwin, county surveyor of Kerry, has, we regret to state, lost his only son, Lieutenant W. A. Delays Goodwin, who was killed in action. Lieutenant Goodwin, who was in his twenty-third year, obtained a commission in the Yorkshire and Lancashire Regiment, and was signalling officer to his battalion at the time of his death.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars have reached us during the present week. Other reports will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Axminster R.D.C.—With reference to the proposed isolation hospital it was reported that a committee had met a similar committee of the Lyme Regis Town Council, and had agreed that the town clerk of Lyme Regis should prepare a scheme.

Bradford T.C.—It is proposed to execute alterations at the Cartwright Memorial Hall, at an estimated cost of £240.

Burnley T.C.—The Local Government Board are being asked to sanction the purchase of Bank Hall and 13½ acres of land for the purpose of a maternity centre.

Clowne R.D.C.—The council are conferring with the parish council on the question of the provision of public conveniences.

Falmouth T.C.—Inquiries are being made with a view to providing a site for a smallpox hospital.

Kirkcaldy T.C.—The electrical engineer recommends the building of a new power station near the sea and railway.

Morecambe T.C.—A decision has been reached to purchase the Poulton Hall estate, covering nearly 3 acres, with grounds and buildings, for a new town hall and other municipal buildings. The site adjoins the technical school, the central schools, and the education offices.

Silsden U.D.C.—It has been agreed to defer the question of the erection of an abattoir until after the war.

HOUSING AND TOWN PLANNING.

Bristol T.C.—Application is being made to the Local Government Board for sanction to build twenty houses at Avonmouth.

Strood R.D.C.—With respect to the local housing schemes, which had been carried out under the auspices of the Admiralty, it was explained by the chairman, Mr. C. Lake, in answer to inquiries, that so far as he understood when the Hoo contract was taken, the Strood cottages were also before the Admiralty at £50 a house less than at the present time, but the Admiralty, through no fault of the council, delayed the whole thing for another three months, and when they did accept the conditions, the whole of the prices had gone up to such an extent that the builders refused to carry out the contract. Then the Admiralty offered them another £50 per house to get the work done. The actual cost was all paid by the Government, and, providing the council let the houses when they were completed at the price fixed by the Government, it would not be a copper of expense to the ratepayers. The scheme would most certainly pay for itself on the figures the council had settled with the Admiralty. The clerk mentioned that the original price of the houses was £215 per house; now it was increased to £292. The original contractor withdrew his tender owing to the large increase in prices.

Wallsend T.C.—The borough surveyor, Mr. G. Hollings, has received instructions to proceed with the town-planning scheme, and to obtain expert assistance if necessary.

MOTOR TRANSPORT.

Exmouth T.C.—A second-hand motor lorry has been purchased for £120.

Salford T.C.—It has been agreed to purchase four motor ambulances at a cost of £1,150.

REFUSE COLLECTION AND DISPOSAL.

Stonehaven T.C.—By a majority of one the town council have approved a recommendation of the Public Health and Cleansing Committee that only certain kinds of rubbish should be carted away by the municipal staff free of charge.

Whitby U.D.C.—The General Purposes Committee have been asked to consider the question of the collection and disposal of waste articles which might prove of economic value, including waste paper.

ROADS AND MATERIALS.

Argyll C.C.—A grant of £149 has been made to the Lorn District Committee towards schemes of road improvement.

Banchory T.C.—Sections of High-street and Raemoir-road are to be repaired at an estimated cost of £609.

Barnstaple R.D.C.—On the receipt of a petition from Braunton asking that a road should be tar-sprayed, members protested against men being kept on the roads when they were so badly wanted for the land. It was decided to ask the county council only to tar-spray portions of the roads adjoining houses.

Battersea B.C.—Estimates for £165 have been passed for repairs to Anhalt-road and Bridge-road West.

Bognor U.D.C.—Plans and estimate are being prepared for widening the corner of Gordon-avenue and Chichester-road.

Bridgend U.D.C.—Tar-spraying is to be carried out on Merthyrmawr-road, Quarella-road, and Cemetary-road.

Cardiganshire C.C.—In addition to financing certain road-tarring schemes the Road Board will contribute £943 towards the estimated cost (£1,886) of laying tar-macadam on the Llanbadarn road.

Doncaster R.D.C.—It has been intimated that the County Highways Committee have sanctioned a grant to the rural council of £658 towards the maintenance of the Great North road between Doncaster and Bawtry.

Dudley T.C.—It has been agreed to flag the north side of Hall-street, at a cost of £100.

Dumfries-shire C.C.—It has been intimated to the Dumfries District Committee that the Road Board will be prepared to sanction the full road development grant.

Ealing T.C.—A scheme is being considered for the widening of Broadway.

Hampton U.D.C.—A scheme has been approved for making up Upper Sunbury-road, at an estimated cost of £948.

Hove T.C.—The town council have approved of a proposal for the repair of part of Old Shoreham-road and Sackville-road.

Kirbymoorside R.D.C.—The surveyor, Mr. W. D. Rickaby, reported that the county surveyor (Mr. W. G. Bryning) had inspected the Welburn and Nunnington road which the rural council desired the county council to take over. He had stated that before he could agree to the road being taken over several parts would have to be strengthened, and the whole of the road resurfaced with whinstone. This would cost approximately £1,000. The matter was adjourned until the county surveyor's requirements had been definitely ascertained.

Llanidloes T.C.—A scheme has been sanctioned for the improvement of the river bank near the Smithfield, and at the front of the Britannia Inn.

Lyme Regis T.C.—Formal approval has been given to the scheme of the Dorset County Council for the construction of the proposed new road to Charmouth.

Newcastle-under-Lyme T.C.—The town council have received an intimation from the Road Board of a grant of £977 towards works of resurfacing, tar-spraying and Tarvia grouting.

Norwich T.C.—It has been agreed to accept the offer of certain owners in Recorder-road to make themselves responsible for the making up of that thoroughfare, at a cost not exceeding £1,600.

Orsett R.D.C.—The council have adopted the suggestion of the surveyor, Mr. F. T. Johnson, to make application to the Road Board for a grant towards the cost of tar-dressing the roads.

Rhyl U.D.C.—With respect to the sand-removal works the surveyor, Mr. A. A. Goodall, reported that during the preceding month the sand removed from the promenade and parade roads amounted to 1,648 cartloads. In accordance with instructions given at

the last meeting he had communicated with the contractors with reference to the rate of progress of the work of removing the sand from the Marine-drive, and the contractors pointed out the high winds had blown sand into the roadway as fast as it was cleared away. They also pointed out other difficulties not anticipated.

Woolwich B.C.—Complaint was made at a recent council meeting of the state of the roads, one member characterising the state of things as "diabolical," and another as "disgraceful and dangerous." Councillor Barefoot, while agreeing that the condition of many of the roads was disgraceful, reminded councillors that this was due to their own action. When the estimates were before the Works Committee the borough engineer brought up a scheme to put the roads into something like decent repair, especially those parts which were used for 'bus routes. Members of the committee also spent a good deal of time in inspecting the roads, but when the estimates were considered, the greater part of the money provided to put the roads in proper order was cut out, notwithstanding that at the time the rates were being reduced. The council agreed that the subject should be dealt with by way of report.—The Works Committee have accepted the tender of the Trinidad Asphalte Company, at 12s. per yard super., for resurfacing with asphalt a portion of Artillery-place.

SEWERAGE AND SEWAGE DISPOSAL.

Branston R.D.C.—As a temporary arrangement it has been agreed to construct two rising mains over the river at the end of Henley-street to convey the sewage from Boultham.

Clutton R.D.C.—The council are considering with the Bath Rural District Council the question of an adequate sewerage scheme for Camerton.

Rotherham T.C.—The Sewerage Committee have been asked to consider the question of the extension of the Lord-street sewer.

Stanhope U.D.C.—A proposal has been accepted for connecting the camp with the council's sewage works.

WATER, GAS, AND ELECTRICITY.

Bedford T.C.—Electricity mains extensions estimated to cost £1,300 are recommended by the Electricity Committee.

Castlereagh R.D.C.—A sub-committee has been asked to report upon the Cregagh water supply, with a view to the adoption of a proper system.

Cardiff T.C.—Referring at a meeting of the Tramways Committee to the probable effect of the restricted lighting and daylight saving on the revenue of the department, Mr. A. Ellis, electrical engineer and manager, said they were going to drop in revenue about £20,000 to £25,000—about 30 per cent on the total revenue. In the year ending March, 1916, the income from street lighting was £9,798. It was now down to £881, and their loan charges were £902.

Derby T.C.—Electricity mains extensions are to be carried out at an estimated cost of £1,500.

Grimsby T.C.—The deputy borough electrical engineer reported that since the Summer Time Act came into operation there had been a saving of about 12 per cent on the amount of current consumed for lighting.

Lynn T.C.—The balance sheet for the electricity works showed that the profit for the past year was £1,018, compared with £1,350 for the previous year. It was decided that the whole of the surplus be applied in reduction of capital moneys borrowed for electricity purposes.

Norwich T.C.—The profit earned by the electricity undertaking last year was £4,503. It has been decided to increase the charges for current by 5 per cent.

Salisbury T.C.—The city council have agreed to accept the tender of Messrs. Tangyes, Limited, Birmingham, for the provision of new pumping plant at the Wyndham-road pumping stations. It is proposed to borrow £4,200 for a term of twenty years at 5½ per cent.

Southend T.C.—The Highways Committee have been asked to consider the desirability of extending the use of electricity in street lighting.

Sunderland T.C.—It is proposed to re-cable the low-tension electric mains at an estimated cost of £530.

Wigan T.C.—A scheme has received approval for the enlargement of the Whitley reservoir, at an estimated cost of £629.

MISCELLANEOUS.

Bognor U.D.C.—With reference to the question of allowances to the dependents of eight of the council's employees recently called up for service under the Military Service Act, the council have decided, although those cases differ somewhat from those of the men who voluntarily attested previously, they would, if the Government separation allowance was less in any case than the man's former wages, make such an allowance, not exceeding 5s. a week, as would bring the full allowances up to the amount of such wages.

Scarborough T.C.—It was announced that the Board of Trade had sanctioned the carrying out of certain work of sea defence on the north side. Since that application was made further and somewhat serious developments have taken place on the Royal Albert-drive, and are causing the council considerable anxiety. The matter is under consideration, and will be reported upon.

Surbiton U.D.C.—The War Office having tested the council's steam fire engine, with a view to purchasing it, the chief officer of the brigade has been empowered to sell it at a price fixed by the Fire Brigade Committee.

FOR OTHER ADVERTISEMENTS
See End of Paper.

EAST BARNET VALLEY URBAN DISTRICT COUNCIL.
SEWAGE FARM MANAGER.

The Council invite applications from suitable persons, ineligible for military service, for the position of Manager of their Sewage Irrigation Farm and Disposal Works.

The person appointed will be required to reside in the house provided by the Council on the Farm, free of rent, rates and taxes.

The salary will be at the rate of £2 2s. per week, rising by annual increments of 2s. per week to £2 10s. per week.

Applications, stating age, experience and other qualifications, and whether single or married, must be sent to me marked outside "Farm Manager," not later than Saturday, 5th August, 1916.

Canvassing in any form will be a disqualification.

T. A. BUCKLEY,
Clerk of the Council.

Council Offices,
Station-road, New Barnet.
July 18, 1916. (3,051)

ELLAND URBAN DISTRICT COUNCIL.
ASSISTANT SURVEYOR AND SANITARY INSPECTOR.

Wanted, Assistant Surveyor and Sanitary Inspector. Commencing salary £140 per annum. Full particulars of the appointment and duties may be obtained from the undersigned.

Applications, stating age, qualifications, &c., to be sent to the undersigned not later than Wednesday, August 2nd, 1916.

JAMES CLARKSON,
Clerk to the Council.

Council Offices.
Elland. (3,052)

RUISLIP-NORTHWOOD URBAN DISTRICT COUNCIL.

The above Council invite Tenders for the following supplies, delivered at Northolt Junction (G.W. and G.C. Joint Station) or Ruislip (Metropolitan Station) respectively:—

700 tons Tarred Slag Macadam, at per ton.
600 yds. C. Hand-picked brick or good concrete Hardcore, 4½ in. gauge, at per ton.
Clean Clinker, not less than 2 in. gauge, at per ton.
Certain delivery must be guaranteed.

Tenders, sealed and endorsed "Tenders for Tarred Slag Macadam," or as the case may be, must be delivered to the undersigned not later than 1st August, 1916.

The Council do not bind themselves to accept the lowest or any Tender.

EDMUND R. ABBOTT,
Clerk to the Council.

Council Offices,
Northwood, Middlesex.
July, 1916. (3.050)

Results Obtained by Electric Vehicles in the Removal of House Refuse.*

By J. TERRY, Cleansing Superintendent, Nottingham.

Having given much thought and consideration to the various papers relating to motor traction given at our conferences during recent years, I had decided that motor vehicles were not suitable to the peculiar conditions which prevailed in Nottingham.

Many of you will no doubt remember that our conference last year synchronised with an exhibition organised by the Road Board at the Horticultural Hall, where vehicles of various descriptions were displayed, and it was there I saw the first electric vehicle, with which I was very much impressed. From the information then received, and from my previous knowledge, I summed up the advantages and disadvantages of the various vehicles as follows:

PETROL-DRIVEN VEHICLES.

Advantages.	*Disadvantages.*
Moderate capital cost.	High running costs.
High speed.	Proved inability to withstand constant starting and stopping.
	High maintenance costs.
	Heavy tyre expenditure.
	Dear fuel. Fluctuating price of same.
	Many working parts.
	Motor running while vehicle stands.
	Noisy on low speeds.
	Skilled drivers needed, and special maintenance staff.

STEAM-DRIVEN VEHICLES.

Advantages.	*Disadvantages.*
Moderate capital cost.	Constant wastage of power when standing.
Satisfactory speed.	Skilled labour to manage, and then two men required.
Cheaper fuel.	Costly maintenance.
Satisfactory starting and stopping.	Heavy tyre expenditure.
	Frequent loss of earning power during overhaul.
	Fear of boiler troubles.
	Noise—steam exhaust offensive.

ELECTRIC.

Advantages.	*Disadvantages.*
Ample speed.	High capital cost.
Ability to withstand starts and stops.	Low speed.
Very rapid acceleration.	
Few moving parts, therefore low maintenance.	
Cheaper tyres (initial cost).	
Less wear on tyres owing to easy turning movement.	
Cheap fuel at fixed prices.	
Ease of control, therefore horse men prove successful drivers.	

By employing the electric there would be no noise, odour, smoke, gears to change, no clutch, no carburettor to adjust, no ignition troubles, or no boilers to overheat; therefore I could not fail to lean towards this vehicle, which had to be used on the heaviest possible work, with a staff whose engineering experience was, to say the least, modest.

HEAVY INITIAL COST.

While I favoured the electric vehicle, I did not approve its high cost, and did my utmost to obtain a reduction. I found that the manufacturers, although keenly competitive, were unable to reduce their charges, the reason for this being that the output of electric vehicles is very small compared with other types of vehicles. The works costs must therefore remain high until the demand grows. Added to this, the high cost of freight and insurance brings about a total which appears very heavy compared with the purchase price of petrol and steam vehicles. I also found that the British-built chassis were not cheaper, and therefore I had to consider the vehicles available on their merit at their present prices. I found that users had experienced little or no maintenance, and that the claim that an "electric" was good for a life of even so much as fifteen years, without undue maintenance, was likely to prove true. This materially simplified the proposed initiation, with the result that I advised my committee to make an immediate experiment, which suggestion was promptly acted upon.

I then decided that I needed vehicles of 3-ton capacity, but I have since seen that a mixed fleet of 2 and 3 tonners working in pairs of equal capacity will be ideal for the convenience of our town. The body must be of sufficient cubic capacity to carry the load under average conditions, but no concern need be felt when the weight per cubic yard exceeds normal, as no vehicle of good design should be strained under the occasional maximum conditions.

High speed would be no advantage, for when working in pairs the maximum speed required is governed by the speed of filling. (It would obviously be a fallacy to accelerate speed if the empty vehicle has to wait while the second vehicle is nearing the completion of loading, and alternatively the capacity of body is governed by the distance the loads have to be taken. A speed of from 9 to 12 miles per hour is ample.

It was essential that, whichever power was selected, the vehicle must be capable of starting and stopping upon all levels and conditions of road without causing undue maintenance. The simplicity of the mechanism convinced me that the "electric" would excel in this respect.

BATTERIES.

The next and more difficult point to decide was the selection of battery. When I first mentioned electrics to my chairman he opposed the idea, on the ground that his experience of them was not satisfactory. I replied that I was not surprised, as undoubtedly he had been using lead batteries, and as this may have been the experience of others I trust you will excuse me if I appear to dwell somewhat on this point.

I do not pretend to be an electrical engineer, but I have friends whose advice is worth seeking. Upon hearing my requirements they sagely shook their heads and gave me many hints on the upkeep of lead batteries, which were of a more or less bewildering nature. I then chanced to meet with a pamphlet describing the upkeep of a traction lead battery. The following is a part of the article in brief outline: "All positive plates slowly disintegrate during their working life, though, as will be shown later, the rate of disintegration is largely controllable by the user, depending upon the care exercised in avoiding free and violent gassing in the course of charging the battery. But, slowly or quickly, the process of shedding the active material goes on, and unless ample space is provided for the reception of material so thrown down, it will soon accumulate to a level where it touches the plate, when it 'short circuits,' or, in other words, makes a circuit inside the cell. Unless the cells be immediately cleaned out—and this involves time as well as a certain amount of skill and expense—the plates will soon be ruined."

I need hardly state that such precaution seemed difficult when the nature of our work was considered, and it was a considerable relief to find upon examination that the "Nickel Iron Accumulator" battery was free of weaknesses such as have been described. I agree that the imperfections of the lead battery may be more aggressive when explained in cold print than when handled by skilled electricians. I had to remember that skill in handling does not end the care necessary for successful maintenance. Much harm can be done to the battery by careless discharge, and temporary short circuit, if not absolutely disastrous with some types of lead battery, at least causes inconvenience, and may entail its removal from service. This would necessitate spare sets and special appliances for the easy removal of approximately ¾ ton of cells by the means of lifts, jacks, trucks and similar contrivances.

Obviously in this class of service it is essential to have the battery dust-proof and mechanically strong. This you will agree is even more necessary than very high efficiency, for current is cheap, whereas battery maintenance is expensive. In the nickel iron battery I believe we have a battery which is almost indestructible within a reasonable service. Certainly the manufacturers believe in its longevity, for they have formulated a special guarantee which states that on the completion of 60,000 miles service the battery will still show its original rated capacity, failing which, they will at their discretion bring the cells within the specification, or replace same free of charge. This guarantee is subject to certain con-

* Paper read at the annual conference of the Institute of Cleansing Superintendents, held at Cardiff.

ditions as to maintenance, which are simple to follow and offer no loophole whereby the terms of the guarantee can be avoided.

As the mileage per day on refuse collection is from 15 to 22 miles, the average can be taken at 20 miles per day, which represents at 300 days per annum a ten years' guarantee. The manufacturers stipulate that the maximum period of the duration of the guarantee is eight years. It is comforting to know that, notwithstanding this shortening of the actual period of guarantee, "service" is the destroying factor not "idleness." Since there are many instances where Edison batteries have much exceeded 100,000 miles service in heavy-draught vehicles, it seems probable that the capital write-off at 10 per cent per annum is much too conservative. At this rate of reduction of value the vehicles successfully carry out the work at a price hitherto unheard of with horse traction; therefore it is wise to retain the figure and benefit at a later date should my calculations prove too pessimistic.

The cost of the best type of lead battery is about half that of the nickel iron. Certain makes carry no guarantee whatever, but for a fixed sum per mile a battery maintenance can be arranged. Other makes are guaranteed for a minimum of 20,000 miles. In the event of this mileage not being completed, then a new battery is equipped at a reduced cost proportionate to the lost mileage. That is to say, if 15,000 miles only is completed, then the replacement will cost 75 per cent of a new one, subject to the fluctuations of the metal market.

COST OF CURRENT.

The guarantee of the nickel iron battery has been already stated, and from a business point of view I can, without any highly technical knowledge of electricity, appreciate the fact that on guarantees the nickel iron battery is undoubtedly much superior and more conclusive. Then comes the question of efficiency. The cost of current at 1d. per unit (which is the almost universal charge for traction current, but, unfortunately, not so in Nottingham) will average approximately 2s. per day. What is the difference of 10 per cent in efficiency? This is the admitted advantage of the more efficient lead cell. I repeat, what is this small charge compared with the much higher maintenance costs? I doubt if the difference will cover the loss and inconvenience occasioned by the vehicle being out of commission while the lead batteries are being periodically overhauled and defective plates being replaced.

While on the point of cost of current it is well to remember that where destructors are available so can electricity usually be found, or the necessary plant be installed at a cost not affecting the proposition whatsoever.

The makers of the Edison battery give me the following description of the construction of the nickel iron battery: The Edison battery is composed of a number of steel plates contained in corrugated nickel steel containers. The positive plate contains alternate layers of nickel hydroxide and pure flake nickel, this material being supported in spirally made steel sheaths, the edges of which are overlapped, the whole being submitted to a very high pressure during filling, rendering the contents to a rock-like nature. These are further encased with a number of small steel rings. These pencils are supported in frames made of the same material. The negative plate consists of a number of perforated steel pockets containing iron oxide, similarly supported. The opposite poles are supported by pure rubber strip sheets and frames in a concentrated form, the heavy cost of which, I understand, is largely responsible for the high cost of the cells.

The electrolyte is non-acid, and is composed of a solution of lithia and potash. These ingredients are interesting, insomuch as it is known that potash is a preservative to steel; all the metal parts being of steel, it is probably due to this fact that the long life of the plates may be confidently anticipated.

With regard to maintenance, so far no cost has been involved, but a small sum of money has been set aside to ward against possible expense at a later date. It is usual to add distilled water to each cell by means of an automatic device two or three times per week, depending upon the climatic conditions. The frequency of these operations is regulated by the amount of evaporation. The filling device indicates whether the cell requires more water, by means of a bell or buzzer, which is vibrated when filling is normal. This process occupies from six to ten minutes, and is carried out by unskilled labour. The exterior of the containers is submitted to a bath of nickel, and afterwards painted with an insulating paint known as Esbalite. It is important that cleanliness be observed, and that the cells be regularly repainted should the original coating of Esbalite have flaked off, which is sometimes observed. These precautions are taken with a view to preventing rust, and negligence in this direction may cause leakage to the containers which cannot be repaired, but must be replaced. The replacements of the cans will not destroy the value of the plates, and while the expense is little, such a debit need not be incurred provided ordinary precaution is taken. The Edison battery is totally enclosed, the filling aperture being provided with an ample cap in which is contained a ball valve which prevents foreign matter from encroaching. At the same time it breaks the globules of electrolyte. These are thrown up in an effervescent form during high rates of charge and discharge, and are thus returned to normal useful condition.

WORKING COSTS.

In the report presented to my committee in September last I submitted estimates from the makers of various vehicles and the results of special tests made at Barnes, Heston and Isleworth, Dover and Sheffield, which figures I can supply if desired; but as we now possess figures covering a fairly long period under normal working conditions I think these are preferable.

During six months ending July 1, 1915, the cost of emptying dry ashbins by horse vehicles in Nottingham averaged 4s. 4d. per ton, but owing to the increased charges for horse-keep, wages, &c., the cost is now 5s.

Our No. 1 motor was delivered on October 15, 1915, commenced work on the 18th, and has been in use daily ever since. During the six months ending April 15th it carried 422 loads, weighing 1,288 tons, at a cost of £241 13s. 10d., which is equal to 3s. 9d. per ton, the average weight per load being 3·05 tons.

The costs are made up as follows:—

	£	s.	d.
Depreciation at 10 per cent	52	13	0
Insurance	4	5	0
Oil, water, repairs, &c. (allowed) ...	11	9	8
Tyres—1,819 miles at 1·1d.	8	6	9
Current—2,541 units at 1¼d.	13	4	8
Wages	151	14	9
	£241	13	10

If we take the six months ending July 1, 1916, we get a period corresponding to the period covered by the figures given in my original report, and this is a more fair comparison than taking the first six months' work, which are all winter months. We find that during this time we removed 1,167 tons of refuse, at a cost of £253, or 4s. 4d. per ton, which is exactly the same as the cost by horses, as mentioned in my original report; but it must be remembered that the conditions then were the same as before the war. Under existing conditions, as I have already stated, the cost is 5s., thus showing 8d. per ton in favour of the motor, which means that if all our dry-ash refuse were removed by motors a saving of over £1,000 per annum would be effected, and this in a town which I consider not best adapted to motor traction for this class of work. I have dealt only with the results obtained by our No. 1 motor, but the figures for the No. 2, which has been at work daily since March 13th, are identical.

Mr. Priestley, cleansing superintendent, Sheffield, whose experience of electric motors in the collection of house refuse is greater than that of any other superintendent, recently presented a report to his committee, from which I have pleasure in submitting the following figures:—

No. 1. Vehicle.—Day Work Costs for twenty-two weeks.

Refuse collected, 858 tons, 6 cwt. 1 qr.

	£	s.	d.
Wages	154	15	8
Vehicle costs	40	7	1
Electricity, 3,269 units	13	12	5
Tyres, 2,168 miles	9	0	8
	£217	15	10

Cost per ton, 5s. 0·8d.

Cost of one month's work on same districts with horse labour:—

Refuse collected, 167 tons, 19 cwt., 2 qrs.

	£	s.	d.
Cost	59	1	9

Cost per ton, 7s. 0·4d.

No. 1 Vehicle.—Night Work Costs for twenty-one weeks.

Refuse removed, 1,142 tons, 19 cwt., 1 qr.

	£	s.	d.
Wages	72	3	8
Vehicle costs	38	10	5
Electricity, 2,927 units...	12	3	11
Tyres, 1,880 miles	7	16	8
	£130	14	8

Cost per ton, 2s. 3·4d.

Cost of three months' work on same districts with horse labour:—

Refuse removed, 473 tons, 11 cwt., 2 qrs.

	£	s.	d.
Cost	77	10	3

Cost per ton, 3s. 3·2d.

No. 2 Vehicle.—Day Work Costs for six weeks.

Refuse collected, 314 tons, 4 cwt., 3 qrs.

	£	s.	d.
Wages	47	10	5
Vehicle costs	10	19	3
Electricity—670 units	2	15	10
Tyres—417 miles	1	14	9
	£63	0	3

Cost per ton, 4s. 0·1d.

Cost of one month's work on same district with horse labour:—

Refuse collected, 204 tons.

	£	s.	d.
Cost	38	16	0

Cost per ton, 3s. 9·6d.

No. 2 Vehicle.—Night Work Costs for six weeks.

Refuse removed, 406 tons, 13 cwts., 2 qrs.

	£	s	d
Wages	21	18	0
Vehicle costs	10	19	3
Electricity—758 units	3	3	2
Tyres—459 miles	1	18	3
	£37	18	8

Cost per ton, 1s. 10·3d.

Cost of one month's work on same district with horse labour:—

Refuse removed, 440 tons, 8 cwts.

	£	s.	d.
Cost	55	10	2

Cost per ton, 2s. 6·2d.

Mr. Jackson, cleansing superintendent, Birmingham, who has been working an "Orwell" dust van since May 29th, reports that it is equal to 2·5 horses.

Even if the running costs and standing charges of motor vehicles are only equivalent to the present cost of horse collection, I most strongly contend that from a sanitary point of view the change is to be recommended. I feel personally that too much emphasis cannot be brought to bear on what appears of national importance, for the following among many other reasons which no doubt will occur to you:—

(1) Cleanliness of street.

(2) Labour provided for building chassis in this country.

(3) Reducing the demand for fodder and cereals for horses.

(4) Correspondingly increasing the supply available for feeding cattle.

From a hygienic standpoint the value of No. 1 alone compels us as cleansing superintendents to be in the front rank in adopting this improved form of traction.

In conclusion, it is worthy of mention that my faith in the success of electrics is upheld by many other municipal officials who with myself have franked their good opinion by placing orders and repeat orders as follows: Edison Battery Vehicles.—Sheffield, 5; Chester, 4; Dover, 6; Barnes, 4; Glasgow, 2; Pontypridd, 2; Newcastle, Heston and Isleworth, South Shields and Smethwick, 1 each. Lead Batteries.—Birmingham, 2; Wolverhampton, 1. In many cases reports have been made, in each of which substantial savings have been shown.

Glasgow's New Park.—A new park for Glasgow, at the confluence of the river Leven and Loch Lomond, was opened recently. The Balloch estate, as it is called, is 20 miles by road from the heart of the city, but by rail it is within easy reach of the community. The area which it is intended to use is approximately 200 acres.

CORRESPONDENCE.

PUBLIC ABATTOIRS.

To the Editor of The Surveyor.

Sir,—In the paper which he submitted at the recent annual meeting of the Institution of Municipal and County Engineers, Mr. H. A. Brown is very scathing in his comparison of the position this country occupies with that of Continental nations in regard to the provision of public abattoirs; but surely he overstates his case when he says that, "with the exception of one or two of the more modern erections, there is not a single abattoir in Great Britain which can stand comparison with the slaughter-houses in either France, Holland, Switzerland, or Germany." There are, in addition to those he names at Edinburgh and Belfast, many other public abattoirs in this country fitted up with every modern convenience and in every way fit to compare with Continental abattoirs, so far as sanitation and convenience are concerned. At the same time it can readily be admitted that private interests and public apathy have combined for too long to stand in the way of a more general adoption of public abattoirs, and the granting of the necessary powers to close all private slaughter-houses.

Mr. Brown's remarks upon the status of the abattoir superintendents on the Continent are interesting, but it is hardly likely that Englishmen will ever regard their officials with the same awe as Continental nations do. Nor is it likely that the officials of this country will ever decree that they should be saluted in the manner that every uniformed official on the Continent demands as due to his office.

Mr. Brown gives plans in his paper of an English abattoir for a town of 60,000 inhabitants costing £7,000, and one of a German abattoir for a town of 20,000, costing £18,000, which he asks us to compare presumably to the disadvantage of the English building. A careful comparison of the plans fails to show any grounds for this disparagement, especially if we take, as English surveyors are bound to take, the difference in cost into account. We pride ourselves on being a practical race, and it must strike most people as absurd to slaughter cattle in "palatial buildings in attractive surroundings, with shrubs, trees or grass plots introduced wherever possible, every wall in the place glazed internally, and marble slab lairages." "Palaces for pigs" hardly strikes a common-sense Briton as a practical proposition; and the bar or beer hall found in German abattoirs would have little prospect of being run here at a profit in these days of public control and abbreviated opening hours. Most people would expect the beer hall to have a tendency to make the butcher less careful in killing, and to show less of that humanitarian spirit which the adoption of public abattoirs should promote. Our recent experience of the German does not lead us to place much faith in his humanitarianism, and it is probably the spirit of the "gourmand" rather than the "humanitarian" which prompts him to erect such imposing and costly buildings. Mr. Brown says that there is not a single public abattoir in Germany which is not self-supporting, which is certainly not the case in this country, but rather the exception. The statement, however, on examination is found to be not so disquieting as one might suppose at a first glance. With regard to the size of the buildings and their success financially in Germany, it must not be forgotten that the character of the meat supply differs very considerably from our own. It is well known that the agrarian party in Germany have great political power, and have always aimed at the prohibition of imported foods by means of high tariffs. As Mr. Brown points out in his paper, we find the reverse of this in this country, where in some of our large towns 80 per cent of the meat is imported dead, and only 10 per cent killed in public slaughter-houses. This largely explains the reason why our slaughter-houses are so much smaller than the Germans', and the reason why they are not self-supporting is to be found in a comparison of the charges made in this country with those abroad. The charges made for killing beasts and pigs in the German towns is shown by Mr. Brown to be five to six times higher than those in force at Weston-super-Mare, which again are not the lowest in this country. If the same conditions

applied in this country, by which everyone was forced to kill publicly, and the same or heavier charges were levied in the case of imported meat, as in Germany, British authorities would be able to make their public slaughter-houses pay their way at half the charges levied by their Continental competitors.

That this is so may be seen by comparing the plan of the German abattoir with that for Weston-super-Mare. Mr. Brown says his design is purely Continental, but, if so, it differs very considerably from the typical German plan he gives in his paper, and which he says is in Germany "considered applicable to every conceivable set of conditions." It follows much more closely the plan of the Brighton abattoirs, which were erected over twenty years ago, than the German plan, and is in every way a great improvement on the Continental plan. While both the Weston and German plans show an open space between lairs and slaughter-hall, that at Weston is only 10 ft. wide and very convenient, whereas the other plan makes it necessary for beasts and sheep to travel some 65 to 160 ft. from lairs to killing room. Mr. Brown has not considered any separation necessary between the pig pens and killing room, and the scalding room is apparently not disconnected from the cooling room. On the other hand, the German plan insists on making the pig travel in the open from 65 to 125 ft., then go through a scalding room to reach the killing room. Though unable to share Mr. Brown's thoroughgoing admiration of Continental methods, their many good points are readily admitted, and there can be no question that Mr. Brown's paper is a very valuable contribution to an important branch of the municipal engineer's work.—Yours, &c.,

BRITISHER.

July 17, 1916.

MUD AS A BUILDING MATERIAL FOR COTTAGES, &c.

To the Editor of THE SURVEYOR.

SIR,—Your correspondent, "Excelsior," in last week's issue of THE SURVEYOR, when advocating the use of mud as a building material for the erection of workmen's cottages, states that "as an English nation (by which I presume he means the British nation), we are very slow in moving out of our usual groove, which is often detrimental in many ways to our advancement." Are we to infer from this that the building of cottages for workmen with mud would be an advancement? As a matter of fact, even the Indians, who for generations have, owing to sheer poverty, built their cottages with mud, are now using brick concrete and other such material, and there can be no doubt that as nations have advanced they have left the mud-hut behind. Are we to assume that our nation is now so poor that we are compelled to come back to the dark ages and house our workmen in such erections as "Excelsior" suggests. Surely our social progress in housing reform has not got such a set-back?

"Excelsior" says: "Surely if it is possible to cheapen the erection of cottages or other buildings by the introduction of mud as a building material we should endeavour to use it." His sole aim seems to be cheapness, which in the end is very often the most expensive. "Excelsior," however, seems to forget that the external walls of the cottage is only a small part of the total expenditure—about one-sixth of the whole—so that even although he constructed his walls of paper, he is left with the problem unsolved.

Perhaps "Excelsior" would do well to define his position and let us know whether he is for or against the improvement of the housing conditions of the working classes.—Yours, &c.,

PROGRESS.

July 17, 1916.

THE INSTITUTION MEETING AT BLACKPOOL: ORPHAN FUND.

To the Editor of THE SURVEYOR.

SIR,—I very much regret that at the annual meeting recently held at Blackpool no collection was held on behalf of the Orphan Fund.

Although this omission occurred, I trust those who attended will send what they would have then given direct to the hon. treasurer, Mr. O. Claude Robson, Municipal Offices, Dyne-road, Kilburn, London, N.W., and so prevent the poor kiddies from suffering through this oversight.

I have already sent my mite, and hope my fellow members will do the same.—Yours, &c.,

FRANK MASSIE.

Tetley House,
Wakefield.
July 17, 1916.

ROAD MAINTENANCE IN NORTHAMPTONSHIRE.

In 1913-14 the motor omnibus made its first regular journey on some of the Northamptonshire main roads. During the past two years other 'bus routes have been opened up, and there has been a large increase in heavy motor tractors and commercial vehicles. "Many of the roads," says Mr. Chas. S. Morris, the county surveyor, in his report for the year ended March 31st last, "are not only unsuitable in construction, but are far too weak to carry motor-'bus and heavy-motor traffic, and until they are strengthened and resurfaced it becomes increasingly difficult to maintain a good surface. Patching with tar-binding or tar-macadam overcomes the difficulty for a few weeks, but this method is both costly and unsatisfactory, as the remainder of the road rapidly wears away around the patches and the surface becomes a series of humps and holes. The only remedy is strengthening and reconstruction, but under existing conditions this is impracticable, except to a limited extent, and consequently the public must be prepared for further deterioration and worse roads until the end of the war. With the return of the men (more than 50 per cent are now in H.M. Army), and the normal supply of materials, an increased effort will be necessary to bring the roads to a surface and condition sufficient to successfully carry the heavy motor and 'bus traffic, but this will necessarily entail a very large expenditure on many of the roads."

COST.

During the past year the total expenditure on maintenance (exclusive of improvements and Road Board works) was £19,294 gross and £18,930 nett. Improvements (including repayments of loans) cost £1,172 gross and £1,006 nett. The expenditure upon Road Board works amounted to £26,502 gross and £12,987 nett, the latter being the nett cost to the county for the year.

The total cost was £46,968, and the nett expenditure for the year £32,924.

The total cost amounts to £147·75 per mile, and the nett cost to the council £103·57 per mile.

The estimated expenditure for the current year is £42,565 gross and £37,407 nett, or £133·90 and £117·68 per mile respectively.

On the 281½ miles of roads directly maintained, the cost of maintenance (exclusive of Road Board work) was £45·74 per mile gross, and £44·45 per mile nett.

SURFACE-TARRING AND TAR-BINDING.

Surface-tarring was carried out on nearly 72 miles of road, the area treated being 580,190 sq. yds. The total cost was slightly over £3,596, representing a cost per super. yard of 1·48d.

Mr. Morris gives the following particulars of tar-binding work (exclusive of 'bus routes) partly carried out in 1914, and completed in 1915: Length treated, 9·81 miles; area treated, 109,554 sq. yds.; metal used, 12,039 tons; chippings used, 1,428 tons; total cost of grouting, £3,005; cost per ton of metal treated (excluding chippings), 4s. 11¾d.; cost per yard super., 6·58d.; average thickness of coating, 3·09 in.

Timber, Plywood and Woodwork.—We would direct the attention of our readers to the double-page advertisement of Messrs. C. Jennings & Company, of Pennywell-road, Bristol, which appeared in our issue of last week. The information given in the advertisement should be of the greatest value to all users of timber, plywood or woodwork. We understand that the firm are prepared to answer any questions relating to the materials of which particulars were supplied, or furnish prices delivered to any part of the world, either of goods mentioned in the announcement or of others not included in it. They inform us that they hold stock at their branches and warehouses at Porthcawl (South Wales), Leyland and Pembroke Dock, Leicester, Swansea, Hull, Liverpool, Manchester, Newcastle and other places, and will be pleased to receive inquiries.

The Surveyor

And Municipal and County Engineer.

Vol. L. JULY 28, 1916. No. 1,280.

Minutes of Proceedings.

Roads.

The two papers on Roads by Messrs. Arnall and Schofield, which were read at Blackpool, deal with the subject from different points of view. Both papers have a very practical interest for surveyors, who cannot hope to construct good roads unless they fully appreciate the causes which make for their destruction, and take into account the change in the character and volume of present day traffic. Mr. Arnall's paper—which is reproduced on another page—was of a somewhat unusual type, and for that reason was all the more interesting. The author was able to express in scientific language the results of his long experience with regard to the damage to roads. It is the clear and graphic manner in which he states well-known facts, equally with the valuable deductions which they enable him to draw, that make his paper one of the most interesting and useful contributions ever presented to the institution. There may be some difference of opinion with regard to the extent of surface wear and internal attrition; but the importance of maintaining a smooth road surface, of sealing it so as to exclude all water, and of laying a sufficient depth of material so as to spread the pressure over a greater bearing area, is admitted by all practical surveyors.

That a large amount of interstitial wear takes place is proved by the rounded condition of the stone found when a macadam road is scarified. At the same time it is evident that as the depth increases this wear is very much less, and this, as shown by Mr. Arnall's diagram, is due to the area of the bearing cone becoming larger. Whether a depth of 10 in. is sufficient to prevent this interstitial wear will depend to a very great extent on the weight of the traffic and the character of the tyres. Internal attrition is considerably less when the stone is embedded in and held together with cementing material of a bituminous character. Not only do tar and bitumen fill up the interstices in the road better, but they provide a resilient cushion which absorbs the shock on the surface. The importance of using various sizes of stone so as to prevent voids is clearly pointed out by Mr. Arnall, and this is now becoming very generally recognised. The mischievous effect of water is more apparent in tar-macadam than ordinary macadam. While dampness, as Mr. Arnall observes, is necessary in an ordinary macadam road, wetness, on the other hand, destroys the cementing properties of the binding material, and there is little or no tension between the particles. Water is particularly destructive to stones with much clay in their composition, and clay subsoils or clayey binding materials always lead to trouble. The greasy nature of the clay causes movement in the roadway under the weight of the traffic, and leads to unevenness of surface and corrugation. If the tar in a road is not strong and of a pitchy character, or is used in too great quantity, the effect is somewhat similar to that of wet clay. Corrugation and wave action is generally much more pronounced in tar-macadam roads than in ordinary macadam.

The subject of potholes in roadways is very important. Soft places occur in most roads, and a series of holes frequently develop where there was every ground for believing the surface would keep good for a considerably longer time. There is no doubt that most potholes are started by the action of horses' hoofs, though weakness in the road is generally a contributory cause. Small stones do not stand so well as larger ones, and give way easily to the iron-shod hoofs of horses, or where they have worn in a hollow to the hammer-like action of wheels dropping into the hollows, and the upward bump that occurs when the wheel rises from the hollow, and the drop to the normal which converts the bump into a jolt. The friction caused by rubber tyres is very great, and Mr. Arnall is of opinion that loose stones are "shaken" out rather than "sucked" out of the ground by rubber tyres. Motor 'buses by their similarity of structure and speed do more harm to the roads than their weight and number would account for, and it is the uniformity of the action which leads to an accumulation of effects in the same spot which causes the trouble from motor 'buses.

* * *

Improvements of Highways.

Mr. Schofield's paper on "Improvements of Highways to Meet Modern Traffic" called attention to the great increase in the number of heavy mechanically propelled vehicles, due mainly to the commandeering of railways and horses for war purposes by the Government. Most of the heavy motor vehicles being manufactured by makers in this country at the outbreak of the war were taken by the Government, as well as a large number of privately owned motor vehicles, and a great number of those built since are still being taken for the same purpose; yet, as Mr. Schofield points out, on many of his main roads the number of these heavy motor vehicles is now 60 per cent more than it was when the war commenced. On the Manchester and Liverpool main road the increase during the past five years has been sevenfold. This extra weight is particularly severe on the rural main roads, as they now carry much heavier loads, travelling at higher speeds, than at any previous period; and as speeds are restricted in towns the losses are made up in the rural areas. The need for strengthening these rural roads, which in many cases have very poor foundations, is very great; but, unfortunately, the cost of reconstruction is also very great. Mr. Schofield estimates the cost of providing a hand-pitched rubble foundation with a coating of 4-in. tar-macadam and a 5-in. by 12-in. gritstone edging as being for the 350 miles of rural main roads nearly £2,000,000. Spreading the payment over ten years, this would give a yearly cost of £686 per mile, apart from all cost of maintenance. In the rural districts it has been found

only possible to strengthen the sides of the roads with a narrow width of hand-pitched rubble, and by giving a coat of 1 in. to 4½ in. of tar-macadam, at a cost of £3,200 per mile. In the southern portion of Lancashire there are twelve large county boroughs and fifteen non-county boroughs, and the main roads which link them up carry a very heavy commercial traffic. This is particularly the case where the towns are near to the docks at Manchester and Liverpool. The local millstone setts which were formerly used in most of these districts have been found quite inadequate to cope with the heavy motor vehicles in use to-day, and granite setts on a concrete bed have been very generally adopted as being the most economical form of paving. Where the heavy motor traffic calls for the provision of new foundations, Mr. Schofield is of opinion that concrete foundations with granite or wood paving should be used. In the discussion on this paper several speakers called attention to the damage done to granite setts by the iron-shod wheels of heavy motor vehicles, especially when laid on a concrete foundation. A more resilient foundation, such as that provided by a layer of ashes or tarred chippings, appears necessary to prevent the edges of the setts being spalled under heavy traffic.

Mr. Schofield has found that tarred iron slag has been the most successful surfacing material for rural main roads, and that tarred granite has not been uniformly successful. Tar-grouting he has abandoned in favour of tar-macadam, on account of the latter being cheaper and less subject to adverse climatic conditions. As is generally the case, a difference of opinion found expression in the discussion with regard to the use of tarred granite and tarred slag. Mr. Finch, the county surveyor of Cumberland, prefers granite to slag for tar-macadam, while Mr. Hadfield finds slag best at Sheffield. Its use appears to be largely a question of cost, for while Sheffield and Lancashire have numerous convenient slag heaps, and no granite quarries, Cumberland, on the other hand, has many fine granite quarries. The use of granite mixed with tar of the proper consistency, in the hands of an experienced man will give good results; and where failures are met with it is not the stone that is to blame, but the quality of the tar, injudicious mixing, or geological or geographical drawbacks in the shape of clay subsoils or damp situations.

Motor Traffic Over Railway Bridges.

On Friday last judgment was delivered by the House of Lords in the case of the *Attorney-General* (on the relation of Pickfords, Limited) v. *Great Northern Railway Company*, which raised an important question as to the condition of strength in relation to traffic in which the company were bound to maintain a railway bridge built over a public highway under the powers of a special Act which incorporated the Railways Clauses Consolidation Act, 1845. The point at issue was as to whether the liability of the company as to maintenance was limited to maintenance in a condition fit to bear traffic of the kind existing when it was constructed in 1867, or whether they were bound to maintain it so as to bear the heavy motor traffic of to-day. As the Lord Chancellor said, the question raised is of unusual importance. On the one side it involves an undoubted limitation of the rights of user of public roads carried by a bridge over the lines of a railway company, and on the other it may throw on railway companies the obligation of reconstructing such bridges to meet the growing demands of heavy modern traffic. The circumstances in which this case has arisen must exist in many instances, and they are likely to increase.

The case was originally heard by Mr. Justice Warrington, who decided against the railway company, but his decision was unanimously reversed by the Court of Appeal, who held that the company were not bound to maintain a bridge stronger than that originally constructed. The House of Lords now upheld the decision of the Court of Appeal, Lord Haldane, however, dissenting. The Lord Chancellor said he could not think that the words of the section imposing on the company the obligation to maintain the bridge could be construed as meaning that such bridge was to be a changing and varying structure, altered from time to time to meet the growth of traffic wholly unforeseen and unexpected when the railway was made. The bridge was only bound to carry the road through which it passed, and that was the road determined at the moment when the railway was built, for it did not follow at all that the road within the meaning of the section was the same thing as the use of the road, which might change from time to time. It was the bridge constructed in conformity with the provisions of the Act which the railway company were bound to maintain, and they were, in his opinion, subject to no further or added liability. Lord Haldane, on the other hand, thought that the principle developed by the earlier cases was that where persons acting under statutory powers conferred on them for their own convenience interrupted a highway, they would, unless the statute provided otherwise, be presumed to be under an obligation to construct such works as would restore to the public the use of the highway and to maintain the works at their own expense in a condition adequate to the public need. When in such circumstances the public road which had been interrupted was restored by being carried on a bridge, the bridge and the road, which thus formed part of it, must be kept up to such a standard as would admit of the public enjoyment of the facilities for ordinary traffic over the road that they would have had if the interruption had not taken place, and if the substituted works had not been executed. Having regard to the importance of the question involved, it is perhaps unfortunate that there has hitherto been this doubt as to the law. It has now been settled by the supreme tribunal, and we can only say that we are glad that Lord Haldane's judgment is on the record.

Cleansing Economies.

It was a happy thought on the part of those responsible for the arrangement of the recent Cardiff meeting of the Institute of Cleansing Superintendents to include in the programme a paper by the convener of the Glasgow Cleansing Committee. The fact that members of local authorities are thus prepared to take part in meetings of technical societies organised by officials is significant; and in our view it augurs well for the future development of municipal work in this country. It may be said at once that Bailie Robert Mitchell thoroughly justified the invitation that had been extended to him by reading a paper which was full of practical interest. It would appear that Glasgow is indeed fortunate in having the services as Convener of the Cleansing Committee of one who is really interested in its work, and has taken the trouble to make himself acquainted at first hand with the most modern methods of grappling with the complex problems which arise in connection with the removal of the waste products of a great city. The paper itself covered a wide field, and we must here confine ourselves to a brief reference to one or two of the most important matters dealt with.

In the first place reference was made to the question of self-propelled traction, which was the main subject for discussion at the meeting, and to which we referred in these columns last week. Bailie Mitchell then spoke briefly of several matters in regard to which what we may call scientific economy can be effected. For example, it has been found at Bradford that the emptying of street gullies by means of petrol suction pumps is not only more sanitary than the old-fashioned

method of ladling, but is actually more economical. With regard to the separate collection of waste paper, too, it was pointed out that an actual and immediate profit may be made by its sale during the war, because of the high price that is obtainable in the present abnormal circumstances. Further, even in normal times a considerable indirect saving can be effected by keeping all paper out of bins, and thus increasing the weight per cubic yard of the remainder of the refuse, with a consequent economy in haulage. Bailie Mitchell also referred to the importance of standardisation. This is a principle which is applicable to almost any kind of organisation, and, speaking broadly, the more it is applied the greater will be the efficiency and economy gained. How can it be applied in the organisation of a cleansing department? First, standard nomenclature would enormously facilitate the collection of statistics from various towns and their accurate comparison. Again, the standardisation of plant and appliances would mean greater speed and economy in replacing worn or broken parts, and a minimum dislocation of work in case of breakdown. It is unnecessary to give further examples here, but the whole question is certainly one which might with advantage be taken up by the institute in consultation with the manufacturers. Finally, a word may be added as to the appeals that are from time to time made to householders to burn their own combustible refuse. It is often said that such appeals have but little or no result. May not the reason be that they are too intermittent? Experience in advertising shows that a spasmodic effort in the issuing of circulars is doomed to failure. To be successful the appeal must be sustained.

A New Advocate of Housing Reform.

Sir Leo Chiozza Money, M.P., whose versatility and industry are continuously at high water mark, has been discussing the housing question in the *British Weekly*, and he leaves us in no doubt that if only he had the handling of the problem it would be very soon settled. He thinks that to rehouse all the people of the United Kingdom would be "child's play" as compared with what we have done in this war for the purposes of war. "We do not build houses," he proceeds, "because we follow the conception that somehow or other enterprising persons will arise and put up good houses. We cling to this belief, although we know that a thousand vested interests prevent the demolition of existing bad houses, just as they prevent the destruction of good new ones." It must be admitted that the vested interest in unwholesome property is powerful and widespread—it is not confined to one or two, but belongs to many classes of society—but it seems to us indisputable that the main reason why housing reform lags behind is the confirmed apathy with respect to the subject of the house-dwellers themselves.

Sir Leo Money has received from an American correspondent some particulars of the standardisation of building construction in America, from which he gathers that by standardising parts one can form in concrete 1,000, or 10,000, or 100,000 window-frames, or staircases, or chimneys. "The staircases," he writes, "which in the average house are so indifferently made of poor material that creaky stairs are almost universal, could be turned out in concrete as easily as shelling peas. Suppose you decide to make 100,000 or 500,000 small dwellings. You can have them of one type or ten types, and you can have one or ten different types of such details as the staircase. The making of the standard parts, in material so good that it will last indefinitely, offers no difficulties to the practical man, if he is given a chance to do the job. The one million people normally employed in the building trade of the United Kingdom, working on such lines, could deal with houses at the rate of hundreds of thousands a year. And even by ordinary methods of construction they would do magnificently if properly directed to national ends." The thing seems quite simple in theory, but to attempt to carry it out in practice, even "after Armageddon," would be quite another matter. Sir Leo Money is manifestly on the right track, if he is a trifle airy and over-confident, and it is satisfactory to find that even his enthusiasm for standardisation does not exclude the view that houses should be beautiful as well as healthy.

* * *

Surveyors and Petrol.

In view of the absolute necessity at the present time for directing all our national resources towards the successful prosecution of the war, there has been little or no criticism of the recent decision of the Government to take a census of petrol requirements with a view to the organisation of the available supplies of that commodity in the national interest. The census has now been taken, and the licences that are now being issued show that the quantities applied for are in almost every case being drastically curtailed. No complaint will be made of this, for it must be assumed that it is necessary in the public interest. Letters are already being written to the Press, however, pointing out anomalies in regard to the percentage allowed of the amount requisitioned for different purposes. For example, we observed in a recent issue of the *Daily Mail* a letter signed by "Road Surveyor" in which he bluntly asked whether it is possible to explain on what system the licences are being issued? We refer to his case as it must be typical of many others. His machine is used almost entirely for public work, and his district is of such a size that a car is a necessity if proper supervision is to be exercised. His application, based on average consumption, was for twelve to fifteen gallons a month, and his licence is for six gallons for three months! He adds in his letter that a friend who uses his machine for occasional visits to the golf course applied for two gallons a month, and has got all he asked for. The question of the issue of petrol licences to municipal engineers is one which might well be taken up as a matter of urgency by the institutions representing those officials.

* * *

Rates and Reserve Funds.

The new standards of thought set up by the war have been responsible for a revision of many ideas which were accepted without question two years ago, but which may now be regarded as "old fashioned." For example, it used to be thought a fundamental of rating practice that the rate for any year must be limited to such an amount as was necessary for meeting the expenses of that year. Now, however, most local authorities are effecting substantial economies in various directions, and they are living in anticipation of a suddenly increased expenditure on the termination of hostilities. To meet this situation some authorities are collecting a rate of the old amount, and are placing any sum saved as a result of economies to a reserve fund, which is usually being lent to the Government for the time being. The latest example is afforded by a report to the Poplar Borough Council by the Works Committee which states that by reason of the postponement of paving works and reduction in the estimates for repairs to streets considerable expenditure on street works will be necessary after the war, and expresses the opinion that steps should now be taken by the formation of a reserve fund to provide for such expenditure. They have accordingly referred to the Finance Committee a proposal that £1,000 per quarter should be raised by rate to form a reserve fund to provide for special expenditure on street works after the war. As we have pointed out before, we are a little doubtful both of the justice of this long procedure to present ratepayers and also of its legality.

o

The Destruction of a Macadam Road.*

By T. W. ARNALL, assoc.m.inst.c.e., City Engineer and Surveyor's Office, Birmingham.

Many studies are available to members of the institution of the way in which a macadam road is made, may be made, or should be made: the way in which such a road is destroyed may be a useful addition.

It will be assumed that the road is made up of fragments of broken stone, of various sizes, compacted together, into a more or less solid mass having as small a proportion of voids as possible, and perhaps bound or slightly cemented together by dust or mud. It will be convenient to give but small consideration to positive cementing materials such as Glutrin, Rocmac, and others more or less soluble in water; and to others not soluble in water, such as tar, Plascom, bitumen, and the like. It will be further convenient to assume that the foundation is quite hard and unyielding; if it be not so, the agencies which are destroying the macadam must be supposed to extend into the foundation, which thus becomes part of the structure to be destroyed.

It must first be emphasised that it is impossible to make a solid mass with rounded stones of any size. If round marbles of any size, but all of one size, are thrown loosely into a box, there may be 40 per cent or more of empty space, and no amount of shaking or arrangement can possibly reduce the voids to less than 26 per cent of the total. This proportion is quite independent of the size of the marbles; if they are 1-in. diameter they cannot fill more than 74 per cent of the total space, and they cannot fill more than 74 per cent of that space if they are too small to be separately visible. This supposes that they are all of one size, but obviously if the box be first filled with big marbles, other smaller ones can be placed in the cavities, and there is room for still smaller ones in the cavities then left. The voids can thus be reduced without limit by introducing smaller and still smaller balls into the cavities. It is, however, essential that the sizes be properly graded; it is of no use trying to fill the interstices with balls of only one size, however small they may be; the spaces must first be filled with balls of as big a size as possible, and the smaller ones kept back until no larger ones will go in. (See Figs. 1 and 2.)

For round balls substitute rounded stones of any size or shape, and the argument is substantially true; with oval or potato shaped pieces the voids may be reduced below what would be given by round balls, but the voids cannot be altogether abolished, however small the rounded pieces may be, and however carefully they may be graded and packed.

This argument breaks down when applied to flat-sided stones, free from rounded edges and corners, and it would follow that the road should be made up of such flat-sized, sharp-edged pieces; but even then they must still be graded into suitable sizes. A sett pavement in which the equal-sized pieces are separately placed by hand is not under consideration; a macadam road is made up of random sizes and random shapes, mixed in some way and compacted together as solidly as possible by rolling. Many of the edges and corners are rubbed off in the process, and many of the stones are broken; it is truly a rough and unmechanical process, but it has to serve since no better one is known.

THE BEARING CONE.

The effect produced by a load placed upon a stone forming part of the surface of such a mass may be readily traced. If the stone is resting upon one other only, it must sink or roll over until it bears also upon two or three others; each of these in turn must rest upon at least three others, so that in the result the pressure of the load is passed downwards to the foundation in the shape of a cone, with a rather broad base at the bottom. The cone cannot be closely defined, principally because there is not enough known about the shape and arrangement of the stones composing it. Their size has not much to do with it. If they are all smooth and round like marbles or bicycle balls they are easily pushed aside, and the base of the cone must be a very broad one. If they are flat and parallel, say like pieces of slate laid flat, there will be no side-long pressure, and the base may be no larger than the last piece resting on the foundation. If the pieces are still flat and parallel, but *not* laid flat, the cone will appear in some form or another, and result in a broadened base. In general it will perhaps not be far out to assume that the slant side of the cone is at an angle of 45 degrees; its base will then have a diameter equal to twice the thickness of the macadam. If this is 6 in. the pressure of an isolated load on the top will be spread over a circle about 1 ft. in diameter, and it may therefore be concluded that a steady load concentrated on a small area on the top produces but a moderate pressure per square inch at the bottom.

The way in which the cone would be modified when the load takes the shape of a wheel is indicated in Figs. 3 and 4. A 3-in. tyre will give a cone about 15 in. wide at the bottom, or five times the width of the tyre; an 18-in. tyre will give a cone about 2 ft. 6 in. wide, or something less than 1¾ times the tyre width. The proportionate width of the cone is much less in this latter case than the other, and it must obviously be less in proportion the greater the width of the tyre.

SIZE OF WHEELS.

From Figs. 5, 6, 7 and 8 it is evident that the size of the wheel will have an important influence on this question. If the road were perfectly hard the wheel would touch it in a thin line only, and its diameter would be immaterial, but some sensible depression must be produced on a macadam surface; the line of contact becomes widened out into a sensible area, and with any given degree of sinking, the larger the wheel the larger this area of contact becomes. To fix ideas, Fig. 7 shows that if the sinking is 1 in., the length of contact will be about 9¾ in. with a wheel 2 ft. in diameter and 1 ft. 4½ in. with a wheel 5 ft. in diameter, as in Fig. 8. In other words, the maximum pressure under a 2-ft. wheel will fade away to nothing at a distance of about 5 in. from the centre, and at a distance of about 8 in. in the case of the larger wheel. Hence it is certain that for a given load the sinking of a large wheel must be less than that of a smaller one, for the same pressure is spread over a greater surface, and its average intensity must be reduced in proportion. The mischief done to the road must also be reduced in something like the same proportion; hence the reason for the loadings of the wheels of heavy motor cars as fixed by the Board of Trade Rules, which are summarised in Fig. 10. Roughly speaking, the permitted loads per inch of width of the tyre are proportional to the square root of the diameter of the wheels; they are not exact probably, because the practical dimensions of inches and hundredweights would lead to awkward fractions if more precisely worked out. As the length of contact varies in the same proportion with different wheels, the nett result is that the different loads and wheels give the same average load per square inch upon the surface.

The cone is not shown in Figs. 5 and 6 because there is no definite spot on the surface to start it from; whatever the depression caused by the load may be, it dies away gradually to nothing at the point where the wheel leaves the ground. Still the cone is there, nevertheless. In Figs. 3 and 4 its sides are bounded by a definite crack starting at the surface, passing somewhere between the stones big and little, and tapering away in thickness as it nears the bottom. In Figs. 5 and 6 the crack is replaced by an indefinite looseness among the stones, perhaps aggregating in amount to the definite crack met with in the other case. The only way to prevent the formation of these cracks is for some of the material to escape sideways out of the cone and close up the crack as fast as it is formed. But in the absence of cavities into which this material can escape, this amounts only to pushing the crack into another place, or probably making many little cracks instead of one big one. That there is such a sideways tendency to escape is well seen in a pulpy road; the rut formed by a heavy loaded wheel is plainly due to a lifting at the sides as well as to a sinking under the wheel. Often it may

* Paper presented at the recent annual meeting of the Institution of Municipal and County Engineers at Blackpool.

be seen in front of a roller at work on a thick coating—the mass rises as a flat wave in front, to be forced down again as the roller moves over it. In any case there is no elevation, whether the view of one big crack is taken or a multitude of small ones; whichever view is taken the destruction of the material goes on just the same.

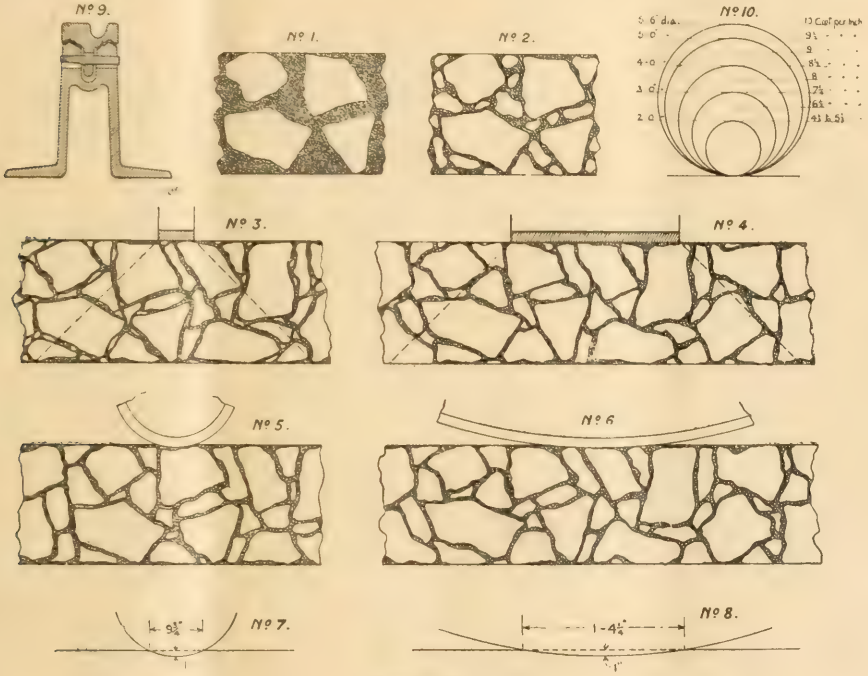
WEAR IS INTERSTITIAL.

It therefore appears that a load cannot be applied at any place on the macadam surface without producing a cone of some sort below it in which the macadam is further compressed; also, if the load is sufficient to cause any sinking whatever of the surface, a crack will be formed between the cone and the unloaded parts of the mass. As the load moves this crack and all the commotion below move along with it, and the whole mass, from the top to very near the bottom, is set in motion in its turn. In this movement the stones, big and little, are forced into new positions. Not one of them moves until it is pushed, and if it is not forced into a cavity already formed, it is forced against something else which opposes the movement. If this obstacle does not yield the pressure may be great enough to break it. It is easier to displace or to crush a small stone than a large one, and the smaller it is the more easily it is dealt with. The nett result of the movement under the passing load is that the whole mass is being ground up into smaller fragments; the larger pieces get their corners and edges broken off, and the angular, flat-sided pieces of the original mass become like rounded pebbles. The moving load makes these bigger pieces act like the pebbles in a cement-grinding mill; the smaller pieces are broken down to sand, and the sand is ground down to mud, or to dust, according to circumstances.

BARKER'S TRAM RAIL.

There is a principle at work here which is worth a closer study, and it is perhaps best brought out by considering what happened to some tramway rails laid down in Birmingham in 1882. They may appear to have little to do with a macadam road, but the experience gained by them was so clear and definite that it will be a useful help in dealing with the present subject. A section of the rail is shown in Fig. 9. It was a steel rail in pieces 10 yds. long, supported on and fastened to closely spaced cast-iron sleepers 2 ft. 11 in. long by steel keys, two to each sleeper. The sleepers were solidly bedded in concrete in the usual way, and the cavity inside them was also solidly filled with concrete. Attention must be fixed upon the successive pairs of bearing surfaces—first the bottom of the rail and the top of the sleeper; next the bottom of the hole in the rail and the bottom of the key; next the top of the key and the top of the hole in the sleeper; lastly, the bottom of the sleeper and the top of the concrete. The theory of the arrangement was that when the rail was worn out it could be easily removed, a new rail keyed to the sleepers in its place, and the whole structure would then be as good as new.

These expectations were not realised. The only wear expected was that on the top surface, and it was found to be the least important of all. Much greater was the wear on the bottom of the rail and the top of the sleeper, and the sleeper wore more than the rail. There was further wear between the key and the rail, and between the key and the hole in the sleeper. Then the surface of the con-



FIGS. 1—10.

crete suffered. Leaving the bottom of the sleeper out of account, it will be seen that there was wear going on at seven different surfaces that had not been provided for, and long before the rail was "worn out" in the ordinary way the wear on these other seven surfaces gave serious trouble. It will be seen that they were all one behind the other, somewhat like the links in a chain. An electrician would say that they were arranged in series, and the same current of destruction had to pass through them all. There was not much to measure at any one surface, but the aggregate was sufficiently imposing.

The stability of such a structure depends upon the stability of every part of it. Consider the first three mentioned pairs of surfaces. If wear takes place at one of them, that pair is loosened, and, as an inevitable consequence, the other two pairs of surfaces become loose also. As in a chain pulled tightly, if one pair of links becomes loose every other pair of links necessarily becomes loose also. It cannot be that all are tight except one; they must either be all tight or all loose. In this case looseness of any one of the pairs of surfaces below the street level meant that grit was constantly getting in between them; every passing car crushed this grit, wearing away the surfaces, and making room for fresh grit to enter as soon as they were

parted again. The frequent presence of water ensured the ground-up stuff being washed away and fresh abrasive material being brought into its place. The looseness of the rail caused the sleepers to become loose, water filtering into the bottom was violently surged to and fro as the car passed over the top. There could not have been much water to begin with, but there was always enough to completely fill the space below, and its scouring effect could have been no greater if it had been 10 ft. deep.

There are four points to be emphasised in this experience, as follows:—

(1) The wear on the top surface was the least important of all.

(2) If one of the other pairs of surfaces became loose, all the others became loose likewise, and opportunities were set up for fresh wear taking place at every one of the surfaces.

(3) The smaller bearing surfaces suffered most. The bearing surface of the keys was only about a quarter of a square inch at the most, but each was as important to the stability of the whole as one of the larger surfaces.

(4) The presence of water greatly increased the mischief. It was under pressure and in motion. It was always bringing fresh grit into position, and washing away that which had been ground up into mud, and was no longer capable of withstanding any pressure or of packing any vacant spaces.

Every one of these points is immediately applicable to what is going on in the destruction of a macadam road.

(1) The wear on the surface is the least important of all.

(2) If a crack forms and makes some parts loose, all others behind them in the direction of pressure necessarily become loose also.

(3) The small pieces suffer most. The large pieces can carry no pressure unless the small ones support them, and a pressure which is sufficient to break any one of them may at the same time break scores of others behind it. The blow must be carried on from one piece to another.

(4) Water greatly increases the mischief. It cannot be kept out of such a porous mass. It is put in motion by every passing load, swilling away the smaller particles which might act as packings, and so taking away the support of the larger ones, which have to withstand the shocks. It acts as a lubricant and makes movements easy that would otherwise be impossible.

DAMPNESS *v.* WETNESS.

The mention of water perhaps makes it convenient to point out that its mischievous effects appear to arise when it is in excess. Wetness must not be confused with dampness. Dampness holds fine particles together; it tends to prevent their movement, and so may have a beneficial effect on the road. Damp sand tipped out of a cart will often hold together in lumps. It has no distinct "angle of repose." The sides of the lumps will stand vertical, and even overhang, so that there must be a real tension between the particles. Nothing of this sort is possible with either dry or wet materials. If they are perfectly dry, the "angle of repose" may be about 45 deg. If they are perfectly wet, it may be very little, and if there is any movement in the water it may vanish altogether; the sand may settle down to a dead level at the bottom of the water. It is obvious that this has important consequences on the stability of macadam, for cracks and cavities filled with water cannot be violently closed up under the traffic without that water being forced out, carrying the finer parts of the mass into new positions. If the mass is merely damp, these cracks and cavities are not full of water.

CLAY.

In addition to water the effects of clay have to be considered in many, if not in most, places. It is not mud, although it may be a constituent of the mud. A little mud mixed with water may settle, and leave the water perfectly clear; a little clay mixed up in the same way may take days, or even weeks, to settle, and whatever does quickly settle is pretty sure to be sand and not clay. It is a decomposition product of felspar, and is therefore a constituent of most of the road-making stones used in the country. The change in the felspar does not often affect the strength or value of the stone, and yet so much of it as has actually been changed into clay is readily washed off the surface of a freshly broken stone. Break the stone again and fresh clay may be washed off the newly-broken surface. In certain stones this may go on without limit; the finer the rock is broken or ground up the greater is the area exposed, and the greater is the supply of clay that can be washed out of it. This process is probably a frequent cause of the supply of clay, which is seldom absent from street mud; the clay makes it of a greasy, slimy nature, and tends to cause it to bake into hard cakes as it dries. Down below the clay acts as a lubricant, as a kind of wet grease, helping in every action tending to make the stones slide upon or rub against each other. It goes wherever the water goes, and makes movement easy under loads that would be quite incapable of shifting a dry, gritty mass.

POTHOLES.

A fairly general sign of the destruction going on is the formation of potholes. For some reason or another a soft place exists in the macadam, perhaps because of a segregation of the smaller, and therefore the weaker, stones; perhaps because the rolling has been less thorough there than elsewhere, as against a manhole, or against the granite edge of a tramway where the paving has caught up the roller before the macadam was properly consolidated. The surface at such places is quickly worn or beaten down into a definite hole which holds the water. When all around is dry, this place is kept in a pulpy condition. If any water is visible in the hole it is certain that all below is thoroughly soaked and in the worst possible condition to carry the traffic. The bottom of the hole usually shows comparatively large angular stones; the smaller ones and the mud and grit are all washed away; probably much of this has been done by the upward rush of water from below, squeezed out of the cavities near to but not under the hole. On the surface the rolling settles most of the larger stones so as to show a flat side upwards; in a pothole the stones are not in this position. Most of them show sharp angular points upwards, which are easily broken off by iron-shod wheels, or easily shaken by the grip of rubber tyres. In either case the conditions lead to a greater wear and tear at the bottom of the hole than on the adjacent surface.

A hollow place in the road is a kind of mechanical equivalent to a flat place on a tramcar wheel, and it is well known that a very small flat has a most surprising effect. A flat an inch wide on a 31-in. wheel makes a bump that can be heard 500 yds. away, and yet when this flat meets the rail the axle drops less than the 100th part of an inch. So likewise, when a wheel meets with a depression in the road, the hammer-like blow given to the bottom of the hole seems out of all proportion to the minute drop in the axle which caused it. It is so because the drop is not the free drop of a falling body under the action of gravity; the downward acceleration is due to the energy of the whole load stored in the deflected springs and suddenly released on the small mass of the wheel; the downward acceleration for a small space may be thirty or forty times that due to gravity alone. There is here quite sufficient reason for the destructive effects on this already weakened and sodden macadam.

But there is generally a still further mechanical effect. If the speed is great enough the upward push given to the wheel on the forward side of the hole takes place so quickly that the wheel is thrown upwards to a greater height than that from which it fell, to fall again and meet the normal surface at some point further on. The bump has become a jolt. At this second place there is a blow nearly as severe as that received at the bottom of the hole, and thus a second hole is quickly formed in advance of the first one. This, again, gives rise in its turn to a third hole, and so in a short time one pothole becomes the cause of many others being formed. They are spaced at pretty regular intervals, and there is no doubt that the intervals would be quite regular if the conditions giving rise to them were regular likewise.

RUBBER TYRES.

The peculiar destructive effect upon the surface produced by rubber tyres has not yet been referred to. The rubber may be easily shortened in one direction if left free to expand in another. Referring to Fig. 5, it is evident that there is no load upon that part of the tyre which first comes in contact with the ground. As the wheel moves on this part becomes loaded, the load increasing to a maximum when the part in question is under the axle, dying away again to nothing as it leaves the ground

at the back of the wheel. As soon as the load comes on the rubber is compressed in the direction of pressure, and must expand sideways to precisely the same degree. But the traction on rubber is enormous; as soon as it comes in contact with a stone on the surface, that stone is firmly gripped and must move along with the rubber which is expanding in one direction because it is being compressed in another direction. Thus the stones in front are pushed forwards, at the sides they are pushed outwards, until the axle comes over any one of them. Then the movement is reversed; the stones in the centre are gradually pulled back, and those at the side pulled inwards into something like their old position as the rubber recovers itself on escaping from under the load. The importance of this process arises from the fact that no stone displaced is ever pulled back into its own place. Not one of them can be violently pushed forwards or sideways without at the same time disturbing multitudes of smaller ones which are not in contact with the rubber at all, and are therefore free to take up new positions. This prevents the stones ever reaching their old positions as they are pulled back again. The passing tyre leaves most of them lying loose on a disintegrated surface. It is commonly said that the loose stones are "sucked" out of the ground; it would be better to say that they are "shaken" out. Every one of them has been pushed in one direction and the next instant pulled back again, but in the meantime the bed on which it laid has been broken up, and it now lies loosely upon instead of being bedded in the surface.

MOTOR 'BUSES.

Motor 'buses call for special mention, since the destruction wrought by them is greater than their weight or number would account for, even when full allowance is made for the heavy loads and high speeds. Beyond these things are the facts that the 'buses are similar in structure, and at any given part of their route they tend to travel at the same speed. At any given hole the same jolt is experienced every time; the wheel comes down on the same place as the one before it did, and whatever mischief is caused by one is exactly repeated by every other one that travels along the same track. Any variation in the load, size of wheels, or speed would tend to prevent accumulation of effects, but as this would interfere with standardisation of structure and regularity of working, it appears that the results must be accepted as inevitable. All the advantages of uniformity and standardisation belong to the owners of the vehicle; the defects and consequent mischief are passed on to the owners of the road. An arrangement of this sort should be capable of some more equitable adjustment.

INTERSTITIAL WEAR.

It is certain then that the destruction of a macadam road is not a question of wear on the surface. A wheel may pass by and leave no track behind, but many of the small stones below have been crushed in carrying the load. The smaller these pieces are the less chance they have of escaping destruction when the pressure comes upon them. In some way the total wear will depend upon the total area of the pieces forming the mass rather than upon their weight and number, and when these pieces are small the total area of surface they expose runs up in a quite unexpected manner. A cube of 1 in. side exposes a total area of 6 sq. in. Cut up this cube into little ones of one hundredth of an inch side—*i.e.*, into pieces the size of fine sand—there will be just the same weight of material, and it will fit just the same bulk of solid space, but the total area of surface will now be 600 sq. in. instead of 6 in. If cut up into particles small enough to be classed as fine dust, or mud, the total area exposed by, say, an ounce of material becomes something enormous. Movement under pressure means wear and tear over a large proportion of this great area. For every grain that is crushed there will be many that suffer by having some edges or corners ground away. The idea that this fine stuff is useful for packing and bedding the larger stones may lead to a fallacy. A certain stone may be so bedded on and supported by, say, 1,000 or 10,000 very small ones. When the blow comes upon it, that blow has to be passed on to and in some way shared among the thousands of very small ones. The "sharing," however, can only be among those that are arranged (as an electrician would say) in parallel; those that are arranged in "series," or one behind the other, have the same blow passed through the lot. There is no "sharing" in this direction. In a water-bound mass no tension is possible, and one bit cannot help another one alongside it; it can only receive the shock in front and pass it on to the bits behind. It may be so broken in the process that when the shock comes next time it will have to be received and passed on by some other neighbouring bit that had hitherto escaped. Water ensures that this fine stuff is kept on the move, and any really effective packing or support of some particular stone can only be of service for very few repetitions of the blow.

REMEDIES.

Apparently, what is required to check this destruction is something in the nature of a cement; something which can withstand a positive tension capable of keeping the parts together when any forces tend to separate them. Two well-marked classes of such cements are in use. Of those soluble in water there is the fear that they may dissolve again and be washed out of the mass. Efforts have been made to prevent this by chemical action amongst the constituents of the cement so that the resulting compound is no longer soluble. Of the cements not soluble in water we have the natural bitumens and very many tar products and mixtures. True bitumens are expensive, and their use only becomes practicable by extensive admixture with cheaper materials. All tar products and mixtures suffer from the defect that the various constituents which give them fluidity and are essential to their cementing properly are all somewhat volatile, so that the cement changes with time. This evaporation, however, can be largely controlled, and the valuable properties of the compound preserved for a long time by periodical attention to the surface. All these matters, however, belong to a study of construction, and cannot therefore be properly included in the present paper.

NEWCASTLE-ON-TYNE TRAMWAYS.

CITY ENGINEER ON THE NEED FOR RENEWALS.

The city engineer of Newcastle-on-Tyne, Mr. W. J. Steele, reporting on the condition of the tramway system, states that the length of tramway opened for service, measured as single track, is 66½ miles. The maintenance of the permanent way has been £9,545 0s. 9d., equivalent to £143 per mile of single track, or 0·40d. per car mile; in addition to ordinary maintenance, £1,580 18s. 1d. was expended in renewals —equivalent to £24 per mile of single track, or 0·06d. per car mile—so that the total cost of the permanent way (exclusive of capital charges) was £11,125 18s. 10d. —equivalent to £167 6s. 1d. per mile of single track, or 0·46d. per car mile.

A considerable length of the permanent way is in urgent need of renewal, but the great difficulty in obtaining a sufficient supply of labour has prevented that necessary work being undertaken. The major portion of the track has been in use for nearly 15 years; consequently the fact that the present heavy service on a permanent way having many steep gradients is maintained at such a comparatively small cost is satisfactory; but it is inevitable that the cost will be greatly increased as soon as opportunity will permit of renewals being carried out.

Shrinkage of Reinforced Concrete.—Mr. F. R. McMillan, of the University of Minnesota, has been making a number of tests to determine the shrinkage and time effects in reinforced concrete. According to a summary of his paper, an American exchange states, the following results were obtained: Beams tested were 5½ in. deep, 30 in. wide, and 12 ft. long between supports. Concrete consisted of 100 lb. cement, 2 cub. ft. sand, 4 cub. ft. stone, hand mixed. Results show that shrinkage of ⅜ in. to 1 in. in 100 ft. can be predicted when concrete is exposed to the ordinary dry air of a heated building. Changes in moisture content will retard shrinkage, and even cause swelling. The yielding of concrete under compressive stress with time is greater as the unit stress is greater, and goes on indefinitely. The deformation was found to be three to five times that produced immediately upon application of load. The time yielding under stress combined with shortening due to shrinkage may result in deformations fifteen to twenty times those expected from calculations.

NATIONAL PHYSICAL LABORATORY.

ROAD RESEARCH WORK SUSPENDED.

The report of the Executive Committee for the year ended March 31st last states that the work of the National Physical Laboratory has been greatly affected by circumstances arising out of the war. A considerable part of the ordinary research work has been in abeyance; in its place a large number of special investigations have been undertaken for Government Departments and the testing work for Government Departments has also very greatly increased. There has been a reduction in other test work, and the laboratory has thus been almost entirely employed with Government work.

The committee record with regret the deaths of two of the earliest and most prominent supporters of the laboratory. Sir Andrew Noble was one of the first advocates of the establishment of a National Physical Laboratory, and was a member of Lord Rayleigh's Committee, the report of which led to its foundation. From the beginning he was among its greatest benefactors; his generosity provided much of the equipment with which it started; his warm support helped it through early difficulties, and his enthusiasm for their work was of the greatest value to the director and the staff.

Sir Arthur Rucker was also a member of Lord Rayleigh's Committee, and it was later his duty, as secretary of the Royal Society, to conduct, with H.M. Treasury, the negotiations that resulted in the foundation of the laboratory, and to draft the scheme of organisation under which it has been worked. The success which has attended it is due in no small measure to the skill with which the foundations were laid. From that time, throughout his active life, he did not cease to take a deep interest in its welfare, and to further its progress whenever opportunity offered.

Owing to the great increase in the work during the past twelve months, it has been necessary temporarily to augment the staff of the laboratory considerably. The additions made have been mainly of men disqualified for service, or women. At the present time the number of women employed at the laboratory in various capacities is forty-seven. "Their work," the report states, "has been very efficiently done, and the laboratory is much indebted to them for their assistance." The thanks of the committee are also tendered to a number of voluntary assistants who have given their services to the laboratory. In some cases the release of men on service has been obtained for work at the laboratory.

The work in practically all departments of the laboratory has been very heavy throughout the year, and the committee express their indebtedness to the staff for the readiness with which the additional burdens imposed on them by the circumstances prevailing have been undertaken. The committee are satisfied that in many ways the work done has been of great value and importance to the nation.

THE ROAD BOARD LABORATORY.

In the Road Board Laboratory mechanical tests on forty-nine varieties of stone for road construction were made during the year. Of these stones, forty were tested for resistance to attrition, thirty for resistance to repeated impact, eighteen for resistance to abrasion, seven for cementation, and nine for crushing strength.

A series of tests on seven kinds of granite setts was made for the engineer to the board. The tests were made in duplicate, and included resistance to abrasion, impact and crushing.

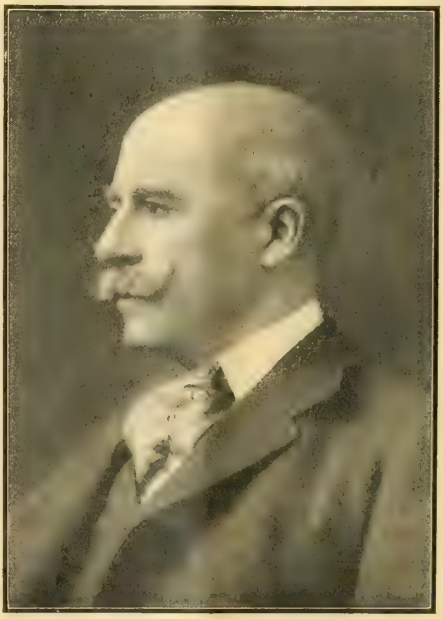
The series of tests on asphalt carpets laid on a concrete foundation, which was started last year, was continued; but, owing to the suspension of some of the activities of the Road Board and the difficulty of obtaining suitable labour, the tests were stopped early in the year. Other investigations which have been undertaken have given valuable indications of the causes of failure of bituminous sand carpets, which have been under test in the road-testing machine.

Proposed New Water Area for Sydney.—The supply of water for Sydney is running short, and the Cataract reservoir is now only one-third full. The Water Board has urged the Minister of Works to proceed immediately with the construction of a new dam at Cordeaux at an estimated cost of £490,000.

DEATH OF MR. JOHN HUTCHINSON.

The world of road making has lost a keen critic and enthusiastic student by the sudden death, from pneumonia, on Sunday last, of Mr. John Hutchinson.

Born in Ireland some sixty-nine years ago, Mr. Hutchinson had travelled extensively, and had gathered a vast store of reminiscences, coupled with a very extensive knowledge of modern paving materials. Until the tar trials in 1907 his interest was chiefly confined to asphalt and bitumens, on which subject he was well versed and well known. During the later years of his life he applied himself most earnestly to the problem of modern road making, and was a frequent contributor to the technical Press. He was a very strong advocate of the principle that every surveyor or road engineer should be in a position to test and prove the quality of the materials he was purchasing. With that end in view he invented a series of special instruments, standardised thermometers, &c., which have proved themselves of the greatest value to students of the science of road making. He quite recently published a treatise on "The Testing of Tars and Pitches for Roads" as a practical guide for engineers and surveyors. Mr. Hutchinson's Stand at the International Road Congress Exhibition held in London in 1913 attracted universal interest, since which time he had continued working and improving incessantly.



The Late Mr. John Hutchinson.
[*Photo by G. C. Beresford, Yeomans-row, S.W.*]

AN APPRECIATION.

"One Who Knew Him" writes: As a man he was gifted with a peculiarly attractive presence which made him a welcome companion at any time; he could illustrate his points in a discussion with a variety of experiences, and his retentive memory enabled him to quote instances and authorities in a remarkably correct manner. As a friend he was staunch and true, and once his confidence was won could be relied upon for support in many an argument or difficult position. He was a well-known figure in Westminster, where his loss will be heavily felt; his stories and experiences, told with true Irish wit, have often relieved the tedium of a meeting by their brilliance and aptitude. It may truly be said of him that he has left his mark on the problem of modern road making, and that his loss will be long felt by a large circle of friends and acquaintances.

Motor Vehicles for Municipal Work.

DISCUSSIONS AT CLEANSING SUPERINTENDENTS' CONFERENCE.

In reporting in our issue of last week the opening proceedings in connection with the nineteenth annual conference of the Institute of Cleansing Superintendents, at Cardiff, we reproduced a number of papers in which members of that body dealt with the question of the use of motor vehicles for the removal of house refuse and for street cleansing and watering. Interesting discussions followed the presentation of the papers. Consideration was first given to a contribution by Mr. J. Terry, cleansing superintendent, Nottingham, on results obtained by electric vehicles in the removal of house refuse, and to one in which the president, Mr. W. Harpur, city engineer of Cardiff, gave an account of the operation of steam tractors in cleansing work.

Mr. W. H. ECCLES (Stockport) said Mr. Harpur's paper proved what he had already pointed out, that motor vehicles for refuse collection were of no use. The continuous stopping and starting must be a great strain on the mechanism of any vehicle. He was impressed in walking round Cardiff to find that one half of the work was done for the officials, in this sense, that the boxes, bins, barrels or things were put on the side of the kerbstone, which must mean a great saving of time and expense in the course of the year. He wished he could get his own folk to do it. (The President: Try them.) Another point in the paper which impressed him was that the vehicles were unsuitable for going on to tips. Still, there was no doubt about it that the time was coming when they would have to consider the adoption of mechanical vehicles to help them to do their work. What with the price of horses and provender, and the cost of labour, it was becoming a very serious matter. The paper read by the president had been most instructive, and they would be able to go back to their councils and committees with a capital report of the experiences of Cardiff.

Mr. JAMES JACKSON (Birmingham; hon. secretary of the institute) said he was afraid he could not speak in some respects so definitely as Mr. Terry on

ELECTRIC VEHICLES.

He was out to learn, and had followed the development of electrical vehicles for some years. He went to Paris some four years ago to see the Fram electric vehicle working. He was very much struck then with the electric vehicle, and the confidence in it of the Paris municipal committee. They tried the Fram machine, made by the De Dion Company, and they were so struck with it that they ordered 100 straight away. Since that time he had carefully followed the work of the electric vehicle. He did not think they had had sufficient time to study the data which had been accumulated. He desired to say as straight as he could that of all the electric vehicles on the market at the present moment, he liked the Edison pattern better than any other. That was as great a compliment as he could pay to the Edison electric vehicle. His difficulty was that the Edison vehicle cost something like £1,000 to £1,100. He did not think a member of any corporation would like such a high cost vehicle, and he hoped that the Edison people would bring it down to a more reasonable sum. The Edison vehicle had been more used in this country on their work than any other vehicle, and the data which had been accumulated was the most reliable they had to work on at the present moment. At the same time he was bound to say that the Ironclad Exide battery was not giving them one minute of trouble in Birmingham. The Birmingham Corporation, when they decided to purchase two of the Orwell type of vehicle, did not purchase because it was the best machine on the market, but with the object of demonstrating the Exide battery. There were plenty of people ready to purchase the Edison vehicle, but the main object in view was to show that there was more than one apple on the tree. He could make certain criticism on the Orwell vehicle, but he did not feel disposed to do so. The main advantage of the Orwell vehicle was that the battery was quite good. It was guaranteed for two years, and at the end of two years the makers were prepared to replace it. He believed, and so did their electric light manager, that their battery was going to have a longer life than two years. If they got anything like 2½ years, the extra half-year would be

ALL PROFIT

on the vehicle they were putting down at the present time. Proceeding, Mr. Jackson said that a great many of them were convinced the electric vehicle had come to stay. They wanted to tabulate their information as fully as they could so that all their colleagues should have the benefit of their experience. He liked the closing words of Mr. Harpur's paper—that care should be taken in selecting a vehicle. What might be suitable in one town would not be suitable in another. Some towns had steeper gradients than others; some towns had back lanes and others had not. In some cities they had to bring portable tins 30 or 40 yds. into the street, which all meant great delay to an expensive machine waiting at the door. They must go slowly in the matter, accumulate their data, spread it amongst the members, and gradually come to a sound conclusion as to what they had to say about the electric vehicle.

Councillor DIGGLE (Rochdale) said that Mr. Terry had stated that the average mileage of the machine was 20 miles per day, but if they worked out the figures in his paper, the machine was only travelling 14 miles per day. With regard to wages, £151 14s. 9d., that could only be 28s. a week for two men. Was that the only cost of working this machine? Were there only two men with it? Were there any further men helping to load this machine?

Alderman J. P. BROWN (Blackpool) said that both the cleansing superintendent and himself were interested in this work, and they wanted some method of collecting the refuse quicker and at less cost than at the present time. He was disappointed with Mr. Terry's paper on those grounds. He thought in the first place the machine was

TOO EXPENSIVE TO GO FROM DOOR TO DOOR

for the collection of house refuse. He did not know of anything yet to beat the horse to do the work. He thought that horses should collect the refuse and that it should be handed over at certain points to motors to take it to the destructors. It was too expensive to have these machines going from door to door. They only travelled about 15 miles a day, owing to the fact, he supposed, that so much time was taken up in loading.

Mr. J. A. PRIESTLEY (Sheffield) said that Mr. Terry's facts, figures and information were very similar to his own, and their experience was on similar lines. It would perhaps be interesting to the members and delegates to know that since the preparation of figures quoted by Mr. Terry in his paper he had issued a further report. The report, presented to his committee in March last, dealt with twenty-two weeks' working of their No. 1 vehicle, and with six weeks' working of their No. 2. He had now got figures which included forty weeks' working of No. 1, twenty-four weeks' of No. 2, and eight weeks' of their No. 3, and the conclusion he came to on the shorter period had been amply borne out by the lengthened trial they had now had. Mr. Priestley quoted figures with reference to the use of the electric vehicle in the collection of street sweeping. He said he lent their city surveyor the No. 3 vehicle, and the result of a week's working night and day showed that on street sweeping the cost of the work was slightly over £2 less than the cost when the work was done by the horse vehicle. Mr. Priestley referred to the remark of Alderman Brown, that the heavy capital cost of the vehicle prohibited its use in house-to-house collection, and pointed out that in both Sheffield and Nottingham that was exactly the work on which the machine had been engaged, and if it could show a

SAVING ON HORSE LABOUR

under those conditions after taking full account of capital charges against the vehicle, it disposed of the suggestion that the high capital cost was a barrier to the success of the machine. Referring to Mr. Jackson's remarks on the Edison as against the Orwell machine, Mr. Priestley said that he was not out to advocate any particular kind of machine. The reason why they in Sheffield selected the Edison battery vehicle

as being the most satisfactory was simply on account of the guarantees they were able to get from the makers. Personally, he would prefer to use a British-built vehicle, with a British battery, but they had to consider what they were buying, and if they could have on the one hand a guaranteed battery of eight years' well, until some other people could come along with a guarantee equal to that, he was going in for the vehicle and the battery he could depend upon. He was taking no risks.

Alderman Lloyd (Bristol) said that they had about 200 horses at work, and they had come to the conclusion that they would have to employ motors. The question to be decided was: What was the best type? and he was there to find that out. The papers clearly condemned

THE STEAM TRACTOR;

petrol was condemned, and the electric motor held the field. He thought, however, they were all agreed that the electric motor had not yet reached its final and perfect condition. They must be prepared to believe that there would be great improvements in the electric batteries running the motors. There was a great future before electric traction in this country, and it rested with the gentlemen present to consider carefully the best form of motor and the best construction of motor. He was in favour of obtaining an electric wagon for ash collection, but he thought there must be a change in construction to make the work of loading very much easier. They ought to impress on the makers the necessity of some more suitable construction.

Councillor Jones (Wolverhampton) said he was one of those old-fashioned people who believed that the horse was still the best thing to employ for refuse collection. For many years they collected their refuse at Wolverhampton with horses and carts, but of late years they had adopted a light wagon system of collecting, which gave them practically the same results as if they employed an electric vehicle. Their drivers collected three wagon-loads per day, and they got six tons, which was equal to an average of two tons each per day. The only advantage he could yet see with the motor vehicle was quicker transit backwards and forwards to the depot. They had had an electric vehicle on trial for a few days at Wolverhampton, but it was not the success they wished. With an electric vehicle, the driver did nothing to assist in the loading, which was not the case with wagons and horses.

Mr. William Greig (Glasgow) asked Mr. Terry to what extent he overloaded his vehicles. He also asked what was the mileage one might reasonably expect from a charge. Had Mr. Terry resorted to boosting in order to exceed that mileage. Mr. Greig said that at Glasgow they had some electric vehicles on order, and they would be put on long journeys when delivered.

Bailie Coughtrie (Motherwell) said that he was anxious to find out the best method of collecting refuse in a comparatively small town. What might be suitable in a large city would be a failure in a smaller place.

Alderman Dr. Greenhalgh (Bury) said that their experience, with a population of 60,000, was that the

COST OF COLLECTION

by motor was 3s. 5d. per ton, and by horse 3s. 10d. per ton. That justified them in going forward with any plan that made for progress. No doubt most committees would jib at the cost of electric vehicles, but he believed it would be possible in the future to produce these vehicles at a less cost than £1,000. If that were so, it behoved cleansing departments of municipalities to keep their eyes open and see what could be done. He would like to know what interest Mr. Terry allowed on the electric motors.

Mr. Terry, replying to various points raised in the discussion, said they allowed no interest on their vehicles, but they allowed 10 per cent depreciation on the working parts. He added that their vehicles had been purchased out of revenue. He hinted in his paper that the electric vehicle was not standardised. When they got to a standardised vehicle, and had a demand for these vehicles, the cost would go down enormously. Whatever applied to large cities applied to smaller towns, provided sufficient horses were now at work to justify the introduction of a motor vehicle. If there were only two or three horses at work it would not pay to introduce an electric vehicle, because there would be insufficient work for it to do; but if they had six or eight horses they would be justified in purchasing an electric vehicle. With regard to the method of discharging from vehicles, with a three-ton vehicle, by simply touching a switch it tipped itself in 20 seconds. Replying to Mr. Greig, Mr. Terry said they had no boosting. They charged the battery to work to three hours and had no boosting above the normal rate. The mileage per charge was 30 to 40 with a full load, and 50 with a half load. With regard to over-loading, there were representatives of vehicle makers present, and in their presence he did not propose to tell what loads he had put on his machines. In his paper he had shown that they had removed 422 loads by a vehicle of 3 tons' capacity, and the average loads were 3·05 per ton. They could judge for themselves what those loads might have been. Mr. Jones, Wolverhampton, had said that horses were not yet done with. The only practical point of view was that of £ s. d., and, while they could not compare the cost of the removal of refuse in one town against another, the only method was at how much per ton could they deliver the refuse at their depots by motor or by horse, and the figures quoted that morning had amply shown that the cost per ton was less by motor than by horse. Therefore, if they could get the

COMPARATIVE COST

in their own towns, it did not matter whether their vehicles cost £1,000 or £2,000, provided they allowed for depreciation. Mr. Jones had made one entirely wrong statement—that they had, with an electric machine, one man sitting on the box. With their vehicles in Nottingham the man who was driving assisted with three men in loading, so that there were, practically, no wages paid to the driver beyond a little overtime on Sundays. Complaint had been made of the construction of the electric vehicle. If it was meant that the vehicle was somewhat higher than some of the wagons they had in the streets to-day, he agreed, but the height of the vehicle now in use was not greater than the height of the old carts now in use in some places. Alderman Brown had said that the cost of the vehicle was too great to go from door to door. That was exactly the work in which their vehicles had been employed at Nottingham, and they were able to show a saving of 8d. per ton in favour of the electric vehicle, irrespective of the initial cost of £1,000. Councillor Diggle had raised the question of mileage. Their present average mileage was about 13 per day. He stated in his paper that 20 miles was the average, but he was working their two vehicles at present in districts nearest to their depots. The vehicles now on order would work in districts some three or four miles away from the depot, and that would give an average of 20 miles a day. With regard to the £151 for wages, that covered a period of 26 weeks. They started their men at 26s. 6d. a week, and that went on for six weeks, and then for another six weeks they had an increase, and they were now paying 32s. per man. If they took the variation between the two that gave the £151.

(To be concluded.)

Cost of Highway Maintenance in Newcastle-on-Tyne.—Mr. W. J. Steele, the city engineer, in his report for the year ended March 31st last, states that the approximate total length of highway now maintained in Newcastle-on-Tyne is 254 miles, and that the cost of maintenance per mile, exclusive of debt charges, and after reducing the total mileage to a figure which makes the back streets equal in width to the front streets, is about £91.

Pembrokeshire Roads: Maintenance Costs.—In his annual report, presented at the last meeting of the Pembrokeshire County Council, the county surveyor, Mr. Arthur Thomas, stated that since last year an additional 6 miles of road had been taken over for maintenance, which brought the total mileage to 144, and the total cost, after deducting a refund from the Great Western Railway Company for the upkeep of their overhead bridges, had been £8,407, or an average of £58 7s. 8d. per mile, against £56 4s. 2d. in the previous year, being an increase of £2 3s. 6d. per mile, which was more than accounted for by the rise in material and the increase in the roadmen's wages. The cost of the rolling, including the cost of the hired rollers, was £640 1s. 5d. Steam rolling had ceased for the present.

The Surveyor
And Municipal and County Engineer.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Should we not all of us be greatly obliged to Mr. F. W. Arnall, of Birmingham, for the lucid and scientific paper on "The Destruction of a Macadam Road," which he read at the annual meeting at Blackpool? Did he not very clearly describe the action of the forces that are at work, under traffic conditions, to disturb and break up a road, and should not these deductions be very helpful to anyone engaged in the construction of roads?

* * * *

Do not the Dutch set us an example of engineering perseverance and courage, when we read that they at once set to work to pump out the sea water from the 50,000 acres of valuable land which were inundated in January of this year, and that they have already succeeded in this gigantic task? When we are told that no less than 20,000,000,000 gallons of water had thus been dealt with by pumping in about four months, are we not struck with the engineering skill which has made such a feat possible?

* * * *

Is it not rather interesting to see by the statistics of traffic taken on the London-Holyhead road between Montford Bridge and Nesscliffe in April of last year that the total average traffic per day was only 324·5 tons, of which about 60 per cent was motor traffic of various descriptions, and does it not tend to show that we are apt to exaggerate the amount of traffic on a road until we can ascertain by correct observation what are the facts? Could it not be assumed that, with the statistics already prepared, the average amount of traffic on our secondary rural roads cannot be much more than 150 tons per day? Shall we not have to alter our views considerably as to what constitutes heavy, medium, and light traffic?

* * * *

Would it not be well if there could be some official pronouncement as to whether crude or refined tar is the best for painting the surfaces of carriageways? Is it possible that, as a matter of fact, there is not much difference, and that the discussions and differences of opinion which arise in connection with this question are due to the variations in quality of both refined and crude tar? Would it not be better to adopt the Road Board specification and thus secure uniformity?

* * * *

Are these not halcyon times for boys, owing to the shortage of labour? But was it not wise of the Truro Rural Council not to accept a recent recommendation of a Parochial Committee to appoint a boy of fourteen years of age as "temporary assistant engineer" at St. Agnes Waterworks, especially as the engineer in charge of these works wrote that he could not be held responsible for the boy if he were left in charge of the machinery? Can anyone blame him for his caution?

* * * *

Are there any limits to which reinforced concrete can be introduced in construction? Is it not interesting to note, for instance, in *Ferro-Concrete* for this month, that there are now on the market reinforced concrete road signs which are made of white Portland cement and crushed granite, the letters being moulded in a plastic state and dovetailed into the groundwork, making the whole a monolithic structure, with the letters painted so as to contrast effectively with the white background? Should not this be a cheap, efficient and almost everlasting description of sign post? But where can they be procured and what is their cost?

THE ACTIVATED SLUDGE PROCESS.

RESULTS AT WORCESTER.

The question of sewage disposal has occupied the attention of the Worcester City Council for a considerable period, and it must be with a sense of satisfaction that they are at length able to feel that the system which they have recently adopted has proved to be a success. It will be remembered that the city council gave permission to Messrs. Jones & Attwood, of Stourbridge, to experiment at the sewerage works in Bromwich-lane with the activated sludge purification process. The firm have been quietly carrying on the necessary works for several months, with exceptionally successful results. When Messrs. Jones & Attwood made an offer to the corporation, and expressed their willingness to accept payment on results, Mr. T. Caink, the city engineer, at once saw the possibilities of the system, and, acting on his advice, the city council decided to give it a trial. Hence, Worcester is the only place in England where the most modern system of sewage disposal on a large scale can be seen at work.

The experiments are at present confined to one of the two sets of tanks at the works, and with these they are dealing with about one-half of the city's sewage. Slight alteration to the tanks has been required, but with the exception of putting in the air-pipes to provide the supply of air, and the provision of an air compressor driven by an electric motor, very little extra expense has been incurred in this direction.

Mr. Caink is highly satisfied with the new system, and is of opinion that the ultimate saving to the ratepayers will be certainly not less than £1,000 a year. The system has only been running for three months, and it has to run for twelve months before Messrs. Jones & Attwood are entitled to payment. Under the previous system the sewage was pumped up from the tanks into filter beds, of which there are no fewer than six. When the new method is in full operation, and the other set of tanks adapted for their purpose, these filter-beds and the irrigation land will be scrapped, thus setting free a considerable area of land for other purposes.

The arrangement between the corporation and Messrs. Jones & Attwood was that the effluent should not contain more than 4 parts per 100,000 of suspended matter, and that it should not be capable of putrefaction, and the analysis, amongst other things, has special reference to these two conditions. A sample of the effluent is forwarded to the county analyst every week. At present five samples have been analysed. The worst of these analyses shows that the conditions laid down are being met, this sample containing 3·8 parts of suspended matter, while the next highest sample contained 1·2 parts, and in none of the samples was there the slightest evidence of putrefaction. Further, the quantity of sewage required to be treated under the agreement was 750,000 gallons a day, and the quantity actually being treated is 800,000 gallons.

Saving in Street Lighting at Hull.—At a meeting of the Hull Corporation Works Committee on Wednesday, it was reported that the manager of the British Gas Light Company had attended a meeting of the sub-committee with reference to the company's account of £5,331 for street lighting for the half-year ended June 30, 1916, and agreed to make a deduction of £1,550.

DUMFRIES COUNTY BUILDINGS.

REINFORCED-CONCRETE CONSTRUCTION.

Of the many municipal buildings in which the Indented Bar and Concrete Engineering Company, Westminster, have been responsible for the reinforced concrete work, the new County Buildings at Dumfries are of outstanding interest, as not only is the whole work of the most fire-resisting nature, but several portions are fine examples of the manner in which the reinforced concrete members may be harmonised with the architectural design. This latter is particularly noticeable in the roof of the council chamber, the details of which are given in the latter part of this article.

Dumfries County Buildings—Elevation.

The main block is 164 ft. long by an average 30 ft. wide, with two wings each 65 ft. by 29 ft., enclosing a courtyard approximately 85 ft. by 65 ft., approached by drives on either side.

Our reproduction of the front elevation of the building, which is constructed of stone from the Locharbriggs Quarry, shows the handsome and dignified appearance of the structure.

On the ground floor accommodation is provided for the education department, road surveyor, county clerks, collectors, committee rooms and Chief Constable. On the first floor are the members' writing room, committee rooms, chairman's room, sanitary and veterinary inspectors' offices, chemical and bacteriological laboratories, and medical officer's department. The second floor is used for general purposes, such as stores, &c. The council chamber is situated in the right-hand corner of the back of the main block, and the height of two floors.

The reinforced concrete work (states the *Indented Bar Bulletin*) consists of the whole of the floors and roof, which latter is asphalted. The first floor is generally 4 in. thick, supported on beams of various sections according to requirements. In the cases of the larger rooms on the ground floor the panels of the ceilings are formed by the beams supporting the first floor. In one particular instance, however, the first-floor slab is increased in thickness to 8 in., eliminating the beams and giving a perfectly flat soffit.

The second floor is similar to the first floor, but the beams supporting the floor slab also form the bottom ties of the roof trusses. These mansard roof trusses vary in span from 25 ft. 6 in. to 38 ft., and carry the roof slabs, which are 3½ in. thick, and a 3-in. reinforced concrete ceiling, approximately 4 ft. below the roof proper. Thus the whole of the second floor, roof trusses, roof slabs and beams, including the dormer cheeks, are monolithic, resulting in an economical structure of great strength.

The roof of the council chamber, which is approximately 50 ft. long by 30 ft. wide, is of the barrel-vaulted type, and consists of a main segmental arched side of each of the three bays formed by these ribs spanning 26 ft. 6 in. clear, with a rise of 10 ft. 3 in. from the springings to the underside of the crown. These ribs are all 2 ft. deep, the two end ones 2 ft. 2½ in. wide, and the two intermediate ones 2 ft. 8 in. wide, supported at either side by columns 13 ft. high from the floor level to the tops of the caps. On either side of each of the three bays formed by these ribs secondary vaultings have been formed of 4-in. slabs, curved to a semicircle of approximately 13 ft. radius, springing from the column caps. The ribs, in order not to interfere with the architect's designs, project for 7 in. only below the roof slab, the remainder of their depth being above the roof level. A flat slab 4 in. thick and 8 ft. wide has been formed on either side of the roof, over the secondary vaultings. Ventilation is provided by means of a duct 24 in. by 12 in., in section extending from the centre of the roof to the centres of the two end bays.

The architect was Mr. J. M. Dick Peddie, of Edinburgh, and the contractors for the reinforced concrete work, Messrs. J. Marshall & Company, of Hawick.

The reinforcement throughout consisted of indented bars.

LIVERPOOL WATER SUPPLY.

THE NEED FOR ANOTHER PIPE LINE.

In his report upon the operation of the Liverpool water undertaking during 1915, Mr. Joseph Parry, the consulting water engineer to the corporation, makes the following observations:—

"The continued increase in the consumption of water brings us appreciably nearer to the complete exhaustion of existing resources. The figures given above show an average consumption per day for last year of 40,003,000 gallons, but if allowance is made for temporary decreases caused by the war, this would have been appreciably exceeded. This average quantity does not by any means represent the extent of the demands which the committee have to meet. The highest consumption in any one week of last year was 304,377,000 gallons, being equal to 43,482,000 gallons per day, and over a period of four weeks there was an average consumption per day of 42,200,000 gallons. To supply these demands the existing pipe lines of the corporation will only deliver, including the well supplies, a maximum quantity of 46,000,000 gallons in any one day. From this some millions should be deducted for repairs and other contingencies. Any demand in one day, or succession of days, exceeding the delivery capacity of the pipe lines can only be met by drawing upon the stocks held in reserve in the Prescot reservoirs. These reservoirs are very small in proportion to the demands. When full they hold little more than four days' supply to the district, and when drawn upon in consequence of a high summer use, or of a fracture on the pipe lines, cannot easily be replaced. The above figures leave no room for doubt as to the extreme urgency of the demand for more water. Fortunately the city is spared the anxiety and difficulty of discovering a source from which to obtain a new supply. The water is already at Lake Vyrnwy; a right of way from Vyrnwy to Liverpool exists. All that remains to be done is to lay pipes through which the water may be conveyed from its source to those who need it."

Mr. Parry states that the demand for water along the aqueducts also continued to grow, the total supplies given to local authorities and others outside of the Liverpool compulsory areas having now risen to an average per day of 4,569,000.

Institution of Municipal and County Engineers.

ANNUAL GENERAL MEETING AT BLACKPOOL.—(5.)

Following the speeches reported in our issue of last week, the discussion, at the recent annual meeting of the Institution of Municipal and County Engineers at Blackpool, on Mr. W. H. Schofield's paper on

IMPROVEMENTS OF HIGHWAYS TO MEET MODERN CONDITIONS OF TRAFFIC,

was continued by Mr. A. J. PRICE (Lytham), who said he wished to ask Mr. Schofield if the tarred slag was wearing better than the tarred granite. Mr. Schofield happened to live in his district, and he knew practically the work they had done. He thought Mr. Schofield would admit that in the work he had done with tarred granite he had hardly had a failure, and he could not see why other people should not do so. However, they could not use poor granite and get the same result. If they put it on a road with a bad foundation, or under trees, they would get different results altogether. Therefore, they had to use their judgment as to where they used tarred granite. In the majority of cases success or failure was due to the consistency of the tar. Being in a small place, he was able to keep an eye on what was done. He very rarely got failures. But on a road where it was damp they could not get good results. He quite agreed with what Mr. Finch had said as to wishing that the members of their councils attended the institution meetings. He had just been roasted on the amount of money he had spent on his secondary roads—£1 2s 6d this year—towards which Mr. Schofield had allowed him £200. They were supposed to be allowed one-third of the cost. The poor surveyor was looked upon as a very expensive man when he spent money which was necessary on the roads. He was very glad to get these figures, as they would be very useful to him.

Mr. T. S. PICTON (Eccles) said the borough of Eccles was one of the sufferers in connection with the amount of heavy traffic upon the road which Mr. Whyatt had mentioned. About a mile of that road—the Liverpool and Manchester main road—passed through Eccles. In 1893 that length of road was paved with ordinary macadam. They entered into negotiations with the county council and the Government, and they borrowed a sum of £12,000 to reconstruct a portion of the main road. They took up the granite macadam, and in some lengths they put down granite setts and in other lengths flag rock setts. These sections were completed in 1901-2. Those granite setts, which were not put on a concrete foundation, would bear close examination. The majority of the setts were placed on an ordinary cinder foundation. After seven or eight years the flag rock setts began to wear, to crack and to break up. Naturally, the Eccles Council had a conference with Mr. Schofield, and a year and nine months ago they took up a section of flag rock setts, which were actually pulverised and no use at all, and they placed granite setts on a 6-in. concrete foundation. He took the precaution, after the concrete was thoroughly set, to place a 2-in. sand cushion upon it, to lay the flags upon, so that the damage which was happening was not due to the steel-tyred vehicles coming into contact with two hard substances, because there was that 2 in. of cushion. There were three kinds of setts used, some from Norway, some from Scotland and some from Shropshire. If they went over that area, which was laid eighteen months ago, and carefully examined the setts which were obtained from Scotland and from Shropshire, they would find about twelve crushed setts in a square yard. What was the experience with the granite setts laid in 1901-2. They would find scarcely three or four damaged setts in a square yard. Now that was the position on that main Manchester and Liverpool road—on which the traffic had increased so enormously in the last seven years. It proved to him that the proper thing was to bar steel-tyred vehicles and go in for rubber tyred. And the most important thing was to get the quality and the value of the granite material. Then again, about the speed limit. They read about ships passing in the night; well, it was these wild creatures who passed in the night who did a great deal of damage to their roads. He had had £3 or £4 worth of concrete flags smashed owing to a heavy motor vehicle being driven on to a footpath during the night.

Councillor EILEY (Birmingham) said he was of opinion that the discussion of this question of road construction had been too general and not sufficiently in detail. First, they wanted a general classification of roads. It appeared to him that there were quite as many remedies required for roads as there were roads. Although they could not classify every road by itself, they could treat roads according to different classes. He would like to go to a conference which would discuss roads on motor-'bus routes on which setts were broken up, roads in factory districts, roads in slum areas, and ordinary residential roads. All these roads had to receive special consideration. He suggested that they should have papers on definite kinds of streets, and have criticism on those papers. It would be very beneficial to authorities.

Alderman MUIRHEAD (Liverpool) said, as regarded heavy traffic, there was no form of road paving like setts, if the setts were of good quality. They had a street leading out of the Central Station at Liverpool on which the setts had been down for thirty-one years, and they would last ten or fifteen years yet. Whatever those setts originally cost they would be very cheap. He did not think the motor goods traffic on the roads should be taxed. The goods which were principally carried were food and clothing, and how were they going to cheapen prices if they put on taxes for the use of the roads?

Mr. LATHAM (Burscough) contended that motor users should comply with the regulations which were issued, and which fixed the maximum weight on the axle of any motor vehicle at 8 tons. He had a curious experience with a Roemac road where one half of the road wore away while on the opposite side, with a tarred surface, the Roemac was as good as ever. On the one side they had a canal bridge with a heavy gradient, and yet no damage was done. As to Roemac, he could confirm what Mr. Platt had said. They tried to scarify a length after it had been laid only twelve or fifteen months, and the men asked him if he wanted to break the scarifier. They could not get into it with the scarifier tines or picks. The farmers in his district complained bitterly of the tarred surfaces in summer, and he had been told that the man who invented tar-macadam ought to be hanged. A tar-painted surface was good in summer, but bad in winter. With regard to Mr. Matthew Jones's statement as to his concrete road, he might say that his Roemac road was as good to-day as when it was laid down. His council were so strong on the question of tar-macadam that with horse-drawn vehicles they considered it took two horses to draw a load of 2 tons, formerly drawn by a single horse. With regard to tarred granite macadam, Mr. Price said that it was a complete success. He had roads which had been laid down with tarred granite macadam six years as good as when laid down, but he laid some down on the main road with disastrous results. If they got their tar too soft it was spreading in summer, and if they got it too stiff, it was brittle. Granite tar-macadam was an absolute failure with heavy motor vehicles.

Mr. SCHOFIELD, in reply, said he must thank Mr. Gettings and the other gentlemen who had so kindly expressed their appreciation of this paper, which he wished he could have given in greater detail. He said in opening that if he began to give results of his experiments with all the different kinds of materials, he should be repeating what had been so often said and taking up their time needlessly. With regard to Mr. Gettings, he thought the first question he asked him was in which way did he disagree with the Road Board weights, as given in their classification form. He largely disagreed with the horse-drawn weights as given for Lancashire, not so much with the mechanically-propelled vehicles. The heavy vehicle, one horse, was given as a weight of 1·25 tons. In Lancashire, the tare weight was very nearly that without any load at all, and if the average weight had been given as three tons instead of 1·25 tons, it would have been more nearly correct. With regard to heavy vehicles, two horse, the weight was given as 2·5 tons. They had had loads regularly of 6 tons weight drawn by two horses. Then, further, with traction engines

and trailer the weight was fixed at 8 tons. Most of their traction engine traffic in Lancashire was conveying large boilers or heavy castings, and the greater bulk of their traction engine traffic was carried on a bogie 10 tons in weight, and carried very often a steam boiler 36 tons in weight. He thought the motor lorries, rubber tyred, were given as 6 tons. That was a very moderate weight. Mr. Gettings also asked for particulars of the different roads on which they had laid tar macadam. He laid tar macadam on the Preston, Bolton and Chorley road four years ago, and this had required no repairs except two tar paintings. It was laid 5 in. thick, the traffic was 1,982 tons daily, and the width of the carriageway 32 ft. Most of the traffic was heavy commercial motor wagons. The Blackpool-Preston road length of tar-macadam, laid 5 in. thick, required annual tar-spraying. The traffic was 600 tons per day. And 340 tons was mechanically propelled. The great disparity between the summer and winter traffic on this road made it impossible to give an average. The difference between the summer and winter traffic was that there was between three and four times as much in the summer as in the winter. During the four months of the summer season in Blackpool they had twenty-five or thirty motor chars-à-bancs a day, as well as the increase in the ordinary motor traffic. In another case a road 26 ft. wide carried 1,040 tons. On that road tarred slag lasted for a period of seven years, after which he had to retop the whole length. Mr. Gettings asked what experience they had had in retopping tar-macadam surfaces. So far he had been fortunate. With the one exception he had just mentioned and one other on a trunk road, he had had no need to retop any tar-macadam road in the county. His experience so far as tar-macadam was concerned was only for a period of seven years. Short lengths were laid perhaps ten years ago, but these were not of sufficient importance for him to give any particulars of them. Then Mr. Gettings asked as to motor 'buses. In Lancashire, probably owing to the populous areas being so well served by the tramway system, there had been no expansion of motor 'buses. His roads were not suffering from that form of traffic. They were suffering, as all waterbound roads were in the last few years, in that they required repaving with some other surface. It was impossible to maintain roads with waterbound surfaces under motor 'bus traffic. The first length of Durax paving was put down ten years ago, as an experiment on moderately trafficked roads. It was not put down in competition with tar-macadam at all, but as an experiment purely; the idea being that if a rough-dressed material like Durax could be obtained at a suitable price it would be a suitable method of dealing with the moderately trafficked roads—roads which they felt they could hardly afford to pave with dressed granite setts on a concrete foundation. Mr. Platt, of Rochdale, agreed with the use of granite setts, but complained of the smashing of the setts by the modern form of traffic. There were very few surveyors in this country who had had a longer and wider experience of granite setts than Mr. Platt had. He thought the paving in Rochdale spoke for itself. Mr. Platt had examples, and good examples, too, of all kinds; and he was bound to admit—though he argued if traffic was increased beyond a certain point it would still be economical to put down granite sett paving—that the steel-tyred vehicle was considerably shortening the life of granite paving. There were lengths of granite paving which had been down for fifty years. There was granite paving which he had put down twenty-five years ago, and was still in good condition; but the last two or three years' effect of steel-tyred vehicles had been very disastrous to it. Still with all that he was of opinion that the most economical pavement for heavy traffic roads was a granite or a wood pavement. With regard to Roemac, he had not used it very extensively. The only use they had made of it was on gradients which would not permit of being tar-sprayed. The result during the last two or three years had been decidedly satisfactory. He thought the treatment of gradients with Roemac was very well worthy of experiment. Mr. Platt agreed with him as to the width of roads. He was certainly strongly of opinion that many of their roads were too narrow for present-day traffic, especially their rural roads; but he did agree with Mr. Chapman that one could point to many places where corners had been rounded and roads had been widened where the new conditions were certainly much more dangerous than they were before. He travelled the previous night from his office to Blackpool behind a motor char-à-banc, and his speedometer showed 23 miles an hour. The driver of the char-à-banc could not possibly have done it before the improvements had taken place. It did not add to the safety or the longevity of the road when such speeds were run on it. He quite expected Mr. Hadfield would not agree with his suggestion that granite-sett paving was the most economical. He had had the pleasure of hearing his views on that point previously; but he was still unconvinced. Mr. Finch asked him why the granite tar-macadam was not as satisfactory as the slag tar-macadam. The whole of his work had been done with materials previously tarred. His experience was that granite tarred-macadam would go into potholes in the middle of the road. He did not say that it was a failure in all cases. Mr. Price, of Lytham, was naturally very proud of his tarred granite roads. They were very excellent roads, and had been down some years. He lived in Lytham, and thoroughly appreciated them, but if Mr. Price was to put his tarred granite roads where there was heavy motor traffic they would not stand very long, and he would not be so satisfied with tarred granite-macadam. With regard to the Durax paving which Mr. Stilgoe mentioned, the Durax paving they had laid, and they had laid several miles of it, was put down on the old macadam foundation; it was not put down in any case on a concrete foundation, and generally speaking it had been very successful indeed. There were lengths outside Liverpool which had been down ten years, had had no repair, and were still in good condition. He had no experience whatever of Durax paving on a concrete foundation. Then, with regard to Alderman Muirhead and the taxing of motor wagons. He quite agreed. It would be perfectly ridiculous for a commercial county like Lancashire to enter into any harassing policy against motor wagons. At the same time, he could not get away from the fact that these were doing immense damage to their roads, and contributing nothing towards the upkeep of them, and he did think a reasonable contribution could be exacted from them without interfering with their usefulness or development in any way. In his opinion the use of rubber tyres ought to be made compulsory.

(To be continued.)

County Councils and New Omnibus Routes.—At a meeting of the County Councils Association, on Wednesday, the Highways Committee, having considered the question of framing a general policy for county councils in regard to new omnibus routes, recommended that maps be prepared, showing new routes of traffic and roads capable of carrying 'bus traffic, and that as far as possible the councils should get the owners of omnibuses to co-operate by friendly arrangements as to the routes to be used. These recommendations were agreed to.

St. Paul's Bridge.—In the House of Commons, on the 20th inst., the Minister of Munitions was asked whether he had requested the authorities who had in hand the purchase of property necessary to form the approaches to the proposed St. Paul's Bridge, to suspend such action during the war, as had been the course imposed upon other local authorities having in hand constructional and other schemes involving expenditure of money. Dr. Addison, who replied, said the Ministry took no action in regard to requesting the suspension of the purchase of property, but only in regard to the construction or demolition of buildings. He was unable to trace any communication with the authorities in question.

Edinburgh Municipal Economies.—It was reported at the Edinburgh Town Council recently that cleansing expenditure had been reduced by nearly £7,000. On the fire brigade estimates there had been a saving of £400, public parks and gardens £1,200, baths £700, public libraries £1,100, wash-houses £500, and streets and buildings £12,000. The decrease in revenue from private lighting was £10,000, and from public lighting £1,500. Against these decreases there was an increase in the revenue from motor power of £1,750, making the nett decrease in revenue £9,750. On the expenditure side there was an increase of £2,000 for coal. Over all the results for the year they were left with a credit balance of £42,000.

Organisation in Cleansing Work.

By BAILIE ROBERT MITCHELL, Convener of the Glasgow Cleansing Committee.

A paper dealing with the various branches of a cleansing superintendent's work was presented at the recent annual conference of the Institute of Cleansing Superintendents, by Bailie Robert Mitchell, convener of the Glasgow Cleansing Committee.

After expressing pleasure that the members of the Institute were so alive to up-to-date with regard to the subject of mechanical traction, the author of the paper turned to the question of the cleaning of street gullies. The old and insanitary system of doing this work by means of ladles, instead of by the new method of petrol suction pumps, would not, he considered, be tolerated after the war.

In connection with the matter of the shortage of labour, he thought it would be interesting to know how the question of women labour had been dealt with in various cities and towns, both as regarded hours and wages. Referring to the disposal of old tins, Bailie Mitchell remarked that, while many towns were not obtaining even "scrap" prices for these, others were getting three or four times as much. "How many towns represented here to-day," he proceeded, have introduced a system of waste-paper collection?" This could be made to pay directly during the war, because of the big price to be obtained, and indirectly after the war, because by keeping all paper out of bins, the weight per cubic yard of the refuse which had to be brought to the destructors was increased, thus effecting a substantial saving on the haulage. There was also, of course, the revenue derived from the sale of the paper. A valuable product from destructors was fish manure; yet a number of towns were still burning it. When war broke out this class of manure was at a discount, and higher prices had since been obtained than ever before, proving successfully that there was a home market which only needed cultivating. Another source of revenue was the clinker from destructors. Dealing with the necessity for standardisation in connection with the cleansing superintendent's work, Bailie Mitchell showed how matters could be simplified by a common basis being fixed with regard to the preparation of tabular returns, and types and sizes of bins, plant and appliances and mortar-making. Another matter that had come under his notice was the difficulty of arranging convenient times for the removal of refuse in terrace, cottage and villa houses. With the adoption of the portable bin system new difficulties had arisen, more particularly in England, owing to the system of housing. Men commenced, as in former years, at, say, 6.30 a.m., and had a difficulty in getting their first load owing to householders not having opened their gates. With the ashpit system this was not a serious matter, as only one or two required opening. Now, however, it was necessary to open scores before breakfast. What was being done by various authorities to meet the difficulty? He knew of one city which had a great difficulty in this respect, the work having to be arranged so that the men could fetch any load near the destructor so as to get back by breakfast, whereas, if breakfast were taken first, the men could commence at a later hour in the morning, finding householders out of bed, gates open, and able to proceed with their work. The work could then be organised in the most economical way of collection.

In proposing a vote of thanks to Bailie Mitchell, Mr. R. WILLIAMSON (Manchester), in touching upon a number of the points referred to in the paper, said that the destructor question appeared to have been shelved lately. Many people were going back to the old idea that tipping, although objectionable, was the best way of getting rid of town refuse. If they took the refuse to a tip, they had no clinker to dispose of.

Alderman ELIOTT (Newcastle) seconded. At Newcastle they had engaged women at 6d. an hour for a thirty-six hours' week to assist in the cleansing, and they had done their work most successfully.

Mr. W. H. HAMBLETT (Salford) said he was pleased to learn that engineers were beginning to take an interest in the disposal of clinker. He would not, however, like it to go forth from that conference that the less clinker they had in slab the better the slab was. With regard to standards, these would be very useful. They had often sat at conferences, listened to statements, and taken them back to their homes, only to find that "all that glitters is not gold."

Mr. W. GREIG (Glasgow) paid a high tribute to Bailie Mitchell's interest in cleansing. In Glasgow they found a ready market for street sweepings. The making of slab depended on the nature of the clinker. Clinker well burned should find a ready market anywhere. In Glasgow the demand exceeded the supply.

Mr. J. C. DAWES (Keighley) said that when the Local Government Board tried to standardise results of destructor working, they were so diverse that no one could understand them. They could go to any length in standards. Why not standardise the type of man to sit on committees, and why not take Bailie Mitchell as the standard? (Laughter.) He was surprised to see in the streets the kind of receptacle used for house refuse in Cardiff. At Keighley their bins were placed in a specially constructed bin-house, and not allowed to stand in yards or at the bottoms of gardens. They kept the refuse in a standardised oak tub, which, kept free from the wet, lasted four times the length of the ordinary bin. Mr. Dawes urged that cleansing superintendents should try and manufacture a uniform disinfecting powder.

The PRESIDENT (Mr. W. Harpur), dealing with the question of the collection of waste paper, said the shopkeepers in Cardiff placed their waste paper in bags, and the cleaners collected these bags and took them away. The corporation made no charge for this collection. Previous to the war this waste paper was taken to the marine store dealer, and he paid them 15s. and 10s. a ton, delivered at his premises. At the present time they took the paper to their own depots and people gave them £3 a ton for it. The shopkeepers provided their own bags. As to the collection of ordinary house waste paper, a bag was slung on the back of their refuse carrier, into which the men put the clean paper, brought it back to the depot, and it was sold at the same price. That was an addition they had had since the price of paper had gone up. In Cardiff they had no demand whatever for clinker. They would be glad to give it away. There was no demand even for the manure from the sewage screens. Consequently, manure and clinker were practically wasted. He congratulated Mr. Dawes upon the bin arrangements at Keighley. Except in the main thoroughfares, the refuse collection from private residences at Cardiff was mainly done at night, and they found the arrangement worked exceedingly well.

Bailie MITCHELL, replying to the discussion, said that they had 120 women working in the cleansing department at Glasgow at the present time. They worked from forty to forty-eight hours per week and were paid 6d. an hour. They had 30 tons a week of old paper, and the sale brought in a handsome revenue. In the collection women volunteer reserves had played an important part. They had recesses for putting bins into at Glasgow, the same as at Keighley. Dealing with a remark made by one of the speakers on the previous day, Bailie Mitchell said that at Glasgow they paid good wages in the cleansing department, and they required in normal times able-bodied men. He could never understand how it was that cleansing authorities seemed to hang their heads in connection with the work they were doing. In Scotland their sanitary department was quite apart from their cleansing department, but he recognised that there was a great deal more credit given to the sanitary department than to the cleansing department for the reduced death rate in our cities.

Open-air Bath for Chesterfield.—An open-air swimming bath, presented to the borough of Chesterfield by Alderman C. P. Markham, of Ringwood Hall, was officially opened on Wednesday by the mayor (Alderman E. Shentall).

Galway County Surveyorship.—The Galway County Council are inviting applications for the post of county surveyor for the Eastern Division, at a salary of £350, with an allowance for expenses not exceeding £100. Applications should be sent in by Monday, July 31st.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars have reached us during the present week. Other reports will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Dublin T.C.—The city council on Monday adopted a recommendation sanctioning plans for the rebuilding of premises in a number of streets in the area of the recent disturbances. It was stated that the Bill sanctioning the grant of compensation for loss of property, and also a further loan to the corporation for rebuilding, would probably be passed within a fortnight.

Falkirk T.C.—The town council have adopted the recommendation of the electrical engineer for the erection of an engineer's workshop.

Huddersfield T.C.—It was stated by Alderman Smith, chairman of the Housing and Town Planning Committee, that not a single plan for a dwelling-house had been passed during the past month.

Nuneaton T.C.—The acting borough surveyor has been asked to prepare an estimate for repairing, repainting, and re-roofing the bandstand at the recreation ground.

HOUSING AND TOWN PLANNING.

Huddersfield T.C.—Notice has been given of the intention of the town council to apply for authority to prepare three additional town planning schemes.

Newcastle-upon-Tyne T.C.—The city engineer, Mr. W. J. Steele, reports that very little progress has been made in the three town planning schemes, but in the case of Area No. 2 (Walker and part of Heaton) an important decision has been arrived at by providing that the scheme shall include part of a road which will form a direct route between the city and the coast. If the neighbouring authorities include the remaining parts of the road in their schemes, then, instead of the present tortuous and narrow roads with heavy gradients in some places, the new road will be a direct line commencing at Chillingham-road, passing through Longbenton and Wallsend, and terminating at Queen Alexandra-road, Tynemouth. The length of the new road will be about 4¾ miles, and while not decreasing the distance by the present road to any considerable extent, it will not only have no difficult bends, but will have that advantage of vital importance, easy gradient, which governs the load any particular vehicle can carry. A branch road between Wallsend and Monkseaton, about 2½ miles in length, will reduce the distance between Newcastle and Whitley by just over 1 mile.

Selby R.D.C.—The council have replied to a letter of the West Riding Public Health and Housing Committee on the subject of a town planning scheme for Barlow that they do not consider the local circumstances are such that the proposal would be advisable at the present time.

MOTOR TRANSPORT.

Newcastle-upon-Tyne T.C.—The Watch Committee recommend the town council to purchase a new motor fire engine.

Rotherham T.C.—A light motor lorry is to be obtained for the gasworks department.

Stretford U.D.C.—It is proposed to purchase a light motor lorry for the removal of refuse.

REFUSE COLLECTION AND DISPOSAL.

Newport Pagnall R.D.C.—The council have agreed to adopt a combined scheme of scavenging for the three Brickhills, Wavendon, and Woburn Sands. The estimated cost of a central depot is £300, and the annual expense of the work £190. A comparative statement showed the cost to be £27 less than the present system.

ROADS AND MATERIALS.

Barnstaple T.C.—The borough surveyor, Mr. E. Y. Saunders, has received instructions to carry out tar-painting, and to water the side streets.

Bentley-with-Arksey U.D.C.—The council have accepted the offer of the county council to make up the road margin of the tramway track at Bentley.

Burnham U.D.C.—Negotiations are proceeding for borrowing £4,746 for the completion of the sea front improvement scheme.

Farnborough U.D.C.—A tender has been accepted for the supply of limestone macadam at 10s. 10d. and 11s. 10d. per ton.

Greenwich B.C.—Estimates of £3,144 have been approved for resurfacing work and repairs to footways and channels in certain roads.

Herts C.C.—The Road Board have made a grant of £3,500 for tar-dressing sections of the main roads.

Launceston T.C.—The surveyor, Mr. A. W. Grace, reported that the question of damage to road surface, more especially by barred wheel tractors, was a very vital one. The £700 allowed them by the county council was going a very small way towards the damage done by traction traffic.

North Riding C.C.—A sub-committee have reported upon the proposal for a road from Catterick Great Bridge, *viâ* Catterick Camp, to Richmond. The cost is estimated at from £7,000 to £8,000. The county council have adopted the recommendation of the sub-committee that they should decline to take the new road over as a main road. The estimated annual cost of maintenance is £2,000.

Paignton U.D.C.—A scheme is under consideration for the widening of Preston Sands-road.

Westminster B.C.—The Works Committee are asking for authority to spend an additional sum of £1,000 on wood blocks, and to pave Denbigh-street with wood blocks.

Weymouth T.C.—It has been resolved that all streets not tar-sprayed shall be watered as far as possible.

Wilton R.D.C.—The council have reached an agreement with the military authorities through the Road Board for the repair of Devizes-road during the ensuing year on the basis of a grant to the council of the full amount usually provided for ordinary maintenance.—The surveyor, Mr. R. A. Skelton, reported that he had prepared an estimate for the repair of the middle section of the New Cut-road, which had been badly damaged by military traffic. The lower section of the road and the upper section of the road had both been repaired, leaving the centre portion to be dealt with. His estimate amounted to £712. He had communicated with Major Stallard on the matter, and had received a letter from him offering £8 for the work! The clerk read a letter showing that the offer of £8 was arrived at by taking £40 as the annual cost of maintenance of the road. The usual cost of this section would be £16, but the council spent nothing for the two years ending March 31st last, and it was therefore suggested that £8 would cover the cost of repair. The council in declining Major Stallard's offer asked that further consideration might be given to the matter by the military authorities.

SEWERAGE AND SEWAGE DISPOSAL.

Branston R.D.C.—It was reported that the Local Government Board had consented to the modification of the scheme of Boultham sewage disposal works, and that the Public Works Loan Commissioners had agreed to advance a loan of £350.

Clones U.D.C.—A deed has been sealed with the Ulster Bank for a loan of £700 for the purpose of completing the sewerage scheme.

Droxford R.D.C.—It is proposed to carry out flood-prevention works at Hambledon.

Llandilo R.D.C.—An estimate is to be prepared of a proposed scheme for the inclusion of Llandebie in the main sewerage scheme for the Amman Valley.

Sittingbourne R.D.C.—Plans are to be prepared for sewerage works at Rainham estimated to cost £150.

Wombwell U.D.C.—The surveyor, Mr. W. Quest, has received instructions to prepare plans and estimate for sewerage works at Lundhill Fields.

WATER, GAS, AND ELECTRICITY.

Belfast R.D.C.—The council are considering the question of the water supply at Lower Whitehouse, and are meanwhile in negotiation with the Belfast Water Commissioners.

Bideford T.C.—Mr. Moore, of Messrs. Moore, Bateman & Fox, engineers, reporting on a scheme for augmenting the water supply, states that a reservoir of 27,000,000 gallons could be constructed at Jennett's stream, which would be abundantly supplied by the available collecting area, which exceeds 900 acres, and would yield at least 330,000,000 gallons per annum. The water impounded would be pumped to the council's service reservoir on the Buckland road, a distance of about ½ mile, by pumps actuated by engines supplied by gas from a gas-producer plant. The cost of pumping is estimated at about £100 for twenty-four weeks, the probable time required. A sample of the water taken from Jennett's stream was favourably reported on. The town would be wholly supplied from Gammaton reservoir during the six winter months, and it would supply 3,000,000 gallons per month during the summer. The new scheme is designed to provide the remaining 3,360,000 gallons per month during the summer. On the basis of such prices as may be anticipated at the termination of the war, the scheme, including 10 per cent for contingencies, is estimated to cost £13,588. The town council have approved the report and referred it back to the Waterworks Committee for further consideration.

Blackburn T.C.—The Gas Committee recommend an increase of the carbonising plant at the Greenbank works, the construction of a complete tar distillation plant, and the installation of boosting machinery. The estimated cost of the proposed works is £85,000.

Bradford T.C.—Upon the suggestion of the Central Coal and Coke Supplies Committee a conference has taken place between representatives of the city council and the Shipley Urban District Council to consider the question of the inter-connection and joint working of the respective electrical supply undertakings, in view of the increasing difficulty of obtaining coal. After a general discussion the conference found it impossible to decide, on the information before them, whether any very considerable economies could be effected by the linking up of the two systems. It was therefore decided that the two engineers should look into the matter and make reports to their committees, and that after these reports had been considered the representatives of the two authorities should again meet and discuss the question.

Burton-on-Trent T.C.—A scheme has been approved provisionally for lighting the main streets by electricity, the lamps to be suspended at different parts of the tramway routes.

Donaghadee U.D.C.—The Board of Trade have written intimating that they have decided to defer consideration of the revocation of the Donaghadee Electric Lighting Order for a further period of twelve months from August 18th next.

Hull T.C.—The revenue account of the water undertaking for last year shows a nett balance of £17,823, while the nett profit of the gas undertaking fell to £16.

Keighley T.C.—The tenders of the Chemical Engineering Company and Wilton's Patent Furnace Company, at £1,100, have been accepted for a wash-oil distillation plant at the gasworks for the extraction of benzol and toluol, and the tender of Messrs. Clapham Brothers, at £1,028, for a ball-washer scrubber, with accessories.

Lurgan U.D.C.—The Board of Trade have granted the council an extension of time for the completion of electric light mains for a period of one year from August 7, 1916.

Penrith U.D.C.—It has been agreed to increase the price of gas to ordinary meter consumers from 2s. 8d. to 3s. 1d. per 1,000 ft., and to reduce the quantity supplied to prepayment meters *pro rata*.

Plymouth T.C.—The Gas Committee recommend an expenditure of £15,000 upon the purchase of gas stoves, meters, and automatic installations required during the ensuing three years. The electricity revenue account for the year ended March 31st last shows a total income of £59,996, and expenditure £34,782, leaving a gross profit of £25,214. Out of the gross profit all capital charges were defrayed, leaving a nett profit of £2,185, which the committee decided to add to the reserve fund.

Southampton T.C.—It has been decided to make an additional charge of 10 per cent to consumers of electrical energy, making a total advance of 20 per cent.

Wood Green U.D.C.—The council will offer no objection to the North Metropolitan Electric Power Supply Company extending their mains from Taylor's-lane to Wood Green.

MISCELLANEOUS.

Winchester R.D.C.—It has been agreed to make a representation to the Government, to the County Councils Association, and to the Rural District Councils Association, requesting that steps should be taken to amend the Defence of the Realm Act by excluding land and buildings required by local authorities for carrying out their duties, from the provisions of the Bill now before Parliament. By this it is proposed to take powers to retain buildings and land requisitioned for a period of seven years after the war if required. It was argued that great hardship and expense might be caused to the ratepayers if such were the case, especially with regard to the Winchester Hospital taken over by the military authorities on Morn Hill. It was found that compensation did not work out so favourably as appeared on paper.

Surrey C.C.—The council have consented to the placing of seats along the roads at Epsom for the use of wounded soldiers.

PERSONAL.

Mr. J. W. Griffith, engineer-in-chief to the Dublin Port and Docks Board, has resigned.

Dr. Sinclair, the county medical officer, has undertaken temporarily the duties of sanitary inspector of Forfarshire.

Mr. J. W. Madeley, special drainage engineer, Madras, is to be engaged by the corporation for a further term of three years.

Mr. J. S. D. Moffat, manager of the West Ham Corporation Tramways, has been appointed manager of the Belfast system, at a salary of £800 per annum.

Mr. F. Horbury, surveyor to the Ashby, Leicestershire, Rural District Council, has resumed his duties under that authority, having been discharged from the Army medically unfit.

Mr. Alan Bromley, borough surveyor of Godalming, is recommended by the Selection Committee for an advance of salary of £25 as from April 1, 1916, and a further increase of £25 (raising the salary to the maximum of £350 per annum) as from April 1, 1917.

Mr. H. T. Ridge, surveyor to the Romford Urban District Council, is seriously indisposed, and the chief assistant, Mr. W. H. Adams, has been called up for service, the Central Tribunal having dismissed an appeal made on his behalf. The urban council have decided in the circumstances to ask the tribunal to review the case.

OBITUARY.

Mr. J. Westerby, surveyor to the Whitley Upper (Yorks) Urban District Council, died recently, we regret to state. The council have appointed as his successor Mr. Abraham Hardy, the assistant surveyor.

FOR OTHER ADVERTISEMENTS

See End of Paper.

COUNTY BOROUGH OF BLACKBURN.

WANTED at once, Temporary Draughtsman for Waterworks Department. Must be ineligible for Military Service. Apply, stating salary required, experience, and full particulars, to the Borough and Water Engineer, Town Hall, Blackburn. (3,056)

SURREY COUNTY COUNCIL.

COUNTY SURVEYOR'S DEPARTMENT.

Temporary Assistant (ineligible for Military Service) required with a knowledge of Surveyor's accounts, shorthand, and typewriting. Salary £3 per week. Applications and testimonials to reach the undersigned by Friday, 11th August.

A. DRYLAND,
County Surveyor.

County Hall,
Kingston-on-Thames. (3,057)

WANTED, THE SURVEYOR, Vols. 24 to 42 inclusive, and Vol. 44, in publishers' cases or unbound. Offers to the Publisher, office of THE SURVEYOR, 24, Bride-lane, Fleet-street, E.C.

WANTED immediately, sell or hire, 6 to 8-ton Steam Roller, good working order. Full particulars, and lowest cash, to Box 1,579, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (3,058)

INSECTS AND DISEASE.

THE NATIONAL LEAGUE'S CAMPAIGN.

The National League for Physical Education and Improvement again call public attention to the campaign against insect pests.

This league began an anti fly and vermin campaign last summer, and are again invoking the aid of the numerous organisations which last year carried out educative work to help them to wipe out insect pests. The movement has obtained the support of and promise of help from the most influential of organisations—religious, municipal, and social. Sir Frederick Treves writes:—

"I am glad to see that the movement for the prevention of the spread of epidemics by insects is making such vigorous progress. The matter is one of the greatest moment, while the remedy is in the hands of the people themselves. It is not so much a matter of combating flies as of overcoming the ignorance of those who regard flies merely as an annoyance. Flies and other vermin constitute a positive and acute danger. The human being who 'would not hurt a fly' is a menace to the public health and the product of a pernicious ignorance."

Experience and experiment show that flies have regular breeding places, such as manure heaps, and if steps are taken to keep these covered in earth (which incidentally enhances the manurial value), a considerable blow is struck at the fly pest.

Closely associated with the fly problem is the question of dust collection in London. According to the league, the most advanced local authority in the administrative area of London is the Corporation of the City of Westminster. In no other borough is there a daily collection of household refuse. Another field of hygiene in which this corporation take a leading place is in instituting a system of assistance and advice in combating any discovered outbreak of vermin. Disinfection is done by the council's men without cost and without fuss. In these abnormal times houses hitherto free from such inflictions are sometimes confronted with the problem, and this expert aid is at the disposal of the residents of Westminster.

The National League through the many channels invoked in the cause are distributing thousands of leaflets for the education of the masses. The rules laid down are simple and summary: Kill all flies; screen all food; burn animal and vegetable refuse; keep the dustbin covered and dry.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times.*

The Use of Crude Tar for Roads.—The March Urban District Council received recently a letter from the Ministry of Munitions asking for an immediate explanation of their action in using crude tar for road purposes, an action "contrary to the regulations, and which, by involving a waste of raw materials required for the manufacture of explosives, is opposed to the national interests." The clerk was directed to reply that the council had only received "suggestions" not to use crude tar, and to give an assurance that no more would be used.

Brighton Electricity Undertaking.—According to the accounts of the Brighton Corporation electricity undertaking for last year, there was a loss of £3,989, in consequence of the abnormal increase in the price of coal. Although the sales of electricity dropped, a revision of the tariff resulted in an increased revenue of £459. It is proposed to defray the deficiency from the reserve fund, but the Finance Committee point out that if this fund was written down to current values it would be insufficient to meet the call by approximately £1,000. Owing to the restrictions on street lighting, the revenue was depleted by £7,000, and £2,102 was paid in war allowances to the staff.

* **A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.**

THE COST OF REFUSE DISPOSAL.*

By W. J. Steele, M.Inst.C.E.,
City Engineer of Newcastle-on-Tyne.

The popular opinion that a profit can be earned in the disposal of city refuse, or that at least the present nett expenditure can be appreciably reduced, is questionable; the enormous bulk in comparison with any value it may possess renders the income derived from the sale of its usable components a very small proportion of the cost of handling it.

Probably the most simple and effective means of assisting the solution of the problem would be that the failure on the part of any householder to burn all vegetable and similar garbage from his establishment should be an indictable offence. Some improvement has been effected in this direction voluntarily in Newcastle-on-Tyne, but a very large quantity of garbage which could easily be burnt by the householder is still collected.

If all burnable refuse were dealt with by the householder there would be no necessity to pass the resultant matter through the public destructors, which undoubtedly are effectual machines from the public health point of view, but they are costly to instal and maintain.

Destructors will always be required to deal with the refuse from markets, slaughter-houses and similar institutions, but at the present time, during the winter particularly, large quantities of ashes are again passed through the furnaces at the destructors owing to their being mixed with garbage; if such garbage were eliminated the ashes could be deposited direct on local tips without any treatment, and thereby reduce to a very considerable extent the volume of refuse dealt with at the destructors.

In Newcastle-on-Tyne, during the year ended March 31st last, 133,296 tons of refuse were disposed of; 50,853 tons being deposited on tips, 37,413 tons burnt at the destructors, 24,528 tons sent to sea, and 20,502 tons sent by rail to various farms. The house refuse amounted to 98,324 tons, which is equivalent to 7·07 cwt. per head of the population, or 38·49 cwt. per house, and the cost of collection and disposal was 22·85d. per head of the population, or 10s. 4·39d. per house. The street refuse amounted to 34,972 tons—an average of 138 tons per mile of highway cleansed.

About four years ago the practice of making a separate collection of waste paper was abandoned, owing to the income derived therefrom being less than the expenditure, but with the greatly increased price paid for waste paper the work has now been resumed. At the present time about 5¼ tons are being collected, sorted and baled each week at a nett profit of about £3 per week.

* Extract from annual report.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

APPLICATIONS FOR LOANS.

Derby T.C.—£9,000 for electricity mains and motors.

Loughborough T.C.—£7,000 for the construction of an electric cable.

LOANS SANCTIONED.

Abercarn U.D.C.—£800 for a dehydration plant at the gasworks.

Huddersfield T.C.—£4,000 for the erection of houses.

Killarney R.D.C.—£3,300 for labourers' cottages.

Merthyr T.C.—£15,000, expenditure in connection with the Taf Fechan reservoir.

Wembley U.D.C.—£950 for sewerage works at North Wembley.

Bethnal Green War Bonuses.—Bethnal Green Borough Council are recommended by a special committee to grant a war bonus of 3s. per week to all permanent officers in receipt of a salary not exceeding £200 per annum, except in the case of joint appointments, where the joint salary (excluding emoluments) does not exceed that amount, when the bonus shall be 1s. per week.

LOCAL AUTHORITIES AND OMNIBUS ROUTES.

THE NEW POWERS UNDER THE EMERGENCY ACT.

At the monthly meeting of the Western District Committee of Stirling County Council application was made by two Glasgow motor hirers, under the Local Government (Emergency Provisions) Act, for permission to run motor buses over the roads of the District Committee from Glasgow to Aberfoyle.

Mr. Ripley Ker said if they had power to stop or discourage these motors, he thought they should do so, because of the great damage they were doing to the roads, and the necessity for conserving the petrol supply.

Mr. Watson Murray agreed as to the damage to the roads, but he did not think they should prohibit the traffic, as it was brought out to the country at the week-ends many munition workers who were fully engaged all the rest of the week. At the same time, he thought the owners should contribute something to the upkeep of the roads. It was mentioned that in the Central District 1d. per ton mile was imposed. It was referred to the Roads Committee to consider the matter.

In the minutes of the Highways Committee of the Eastbourne Rural District Council, it was stated that the clerk drew attention to the fact that the Eastbourne Corporation, in addition to prohibiting certain roads for the return journeys of local motor char-à-banc, had recently granted three licences to the Southdown Motor Services, Limited, to run motor coaches between Eastbourne, Seaford and Brighton, subject to the vehicles not entering the town by certain routes, which would entail a still further increase of such heavy traffic over the district roads. The surveyor, Mr. W. Walker, reported that he was taking a census of this traffic at Jevington.

After discussion, it was resolved that the clerk be authorised to confer with Mr. A. J. Lees, Parliamentary agent, and, if necessary, the Local Government Board, and ascertain the position of the council in regard to dealing with such user of district roads.

At the meeting recently of the East Westmorland Rural District Council, the clerk, Mr. W. Hewitson, reported that he had received from the county council the regulations under sec. 20 of the Local Government (Emergency Provisions) Act, 1916, relating to omnibus routes. The letter suggested that the various highway authorities in the county should get the county council to act for them in that matter. It would be difficult, it was explained, for each authority to act by itself, and the larger body would be in a better position to do what was necessary. The clerk stated that there was also a communication from the Lancashire County Council suggesting the combination of counties for the purpose, and to provide through roads from one county to another. Mr. Milne, clerk to the Westmorland County Council, suggested that rural and urban councils should adopt a resolution requesting the county council to act for them in the matter.—Mr. J. Kilner, highway surveyor, said he thought that would be the better course, but at the same time it was a moot point whether each separate authority should be represented on any committee that was appointed to carry out the object. Small authorities should retain some hold over their own highways. It would, however, be a great mistake for individual districts to act singly. The clerk said the suggestion was that the local authorities should delegate their powers to a central authority.—After further discussion it was decided to adjourn the matter for consideration at the Kirkby Stephen meeting.

Electricity Supply at Holmfirth.—The Holmfirth Urban District Council electricity undertaking was formally opened recently. The buildings are of sufficient size to allow for three generating plants—two of 100 kilowatts capacity and one of 60 kilowatts—but the present plant is for 160-kilowatts only. The power is supplied by two gas engines, and there is a suction gas plant. The battery is arranged with tanks of sufficient size to contain eleven plates having an output of 345 ampere hours. The mains for distributing the energy are arranged upon the three-wire system, carried upon steel poles. The streets will be lighted by electricity, and the council are making a start with thirty-one private consumers.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

SOUTH-WESTERN DISTRICT MEETING.

A South-Western District meeting of the Institution of Municipal and County Engineers is to be held at Exmouth to-morrow (Saturday).

PROGRAMME.

3.0 p.m.—Meet at council offices, where Mr. County Councillor Crews, chairman Roads Committee, Exmouth Urban District Council, will receive the members.

Read minutes of previous meeting.,

3.15 p.m.—Proceed to the Marine Drive Works for inspection, where Mr. Hutton will describe the works. The works comprise: Just completed, approximately ½ mile of bulk concrete sea-wall, built by Lord Clinton (Engineers, Messrs. Douglass, Lewis and Douglass); approximately ½ mile of reinforced concrete and masonry sea-wall, built by the Exmouth Council (engineer, Mr. S. Hutton).

In connection with the above and now in course of construction by the Exmouth Council: Approximately 1 mile of reinforced concrete carriageway, 40 ft. wide, with 25 ft. of footpaths (engineer, Mr. S. Hutton).

Arrangements are being made with the contractors to keep the men working during the inspection.

5.0 p.m.—Tea at the Undercliff Tennis Pavilion (adjoining the works) by invitation of Mr. Crews and Mr. Hutton; after which Mr. Hutton will be glad to answer any questions arising out of the inspection.

EASTERN SUB-DISTRICT MEETING.

An Eastern Sub-District meeting (Norfolk, Suffolk and Cambridge) will be held at Sheringham to-morrow (Saturday).

PROGRAMME.

12.30 p.m.—Meet at council offices, where Mr. H. R. Johnson, J.P., chairman of the Sheringham Urban District Council, will receive the members.

Read minutes of previous meeting.

Paper on "Nine Years' Work at Sheringham," by Mr. F. Hall Smith.

1.30 p.m.—Lunch at the Sheringham Hotel. (Tickets 2s. 6d. each.)

2.30 p.m.—Resume discussion—especially Nationalisation of Coast Protection.

3.30 p.m.—Inspect Protection Work, Shelters, &c.

4.30 p.m.—Afternoon tea at "Ormesby," by invitation of Mr. F. Hall Smith.

JOHN R. MEAD,
Hon. Sub-District Secretary.

Ipswich.

A Hampstead Demolition Order.—In the House of Commons last week the President of the Local Government Board was asked whether he was aware that the board had intimated their intention of confirming a demolition order made by the Hampstead Borough Council under sec. 17 of the Housing, Town Planning, &c., Act, 1909, in reference to a house in Palmerston-road, Kilburn, although the house had been certified by experts to be perfectly fit for human habitation in every respect; and whether the board would refer the matter to the president of the Surveyors' Institution, the president of the Royal Institute of British Architects, or the president of the Medical Officers' Association for report. Mr. Long, in reply, said that no intimation had been given of an intention to confirm the demolition order referred to. On an appeal by the owner against the Order, the department had intimated that they were of opinion that the making of the Order by the borough council was justified, but they were also giving the owner an opportunity of remedying the defects which had caused the house to be considered unfit for human habitation. He was advised in all these matters by very experienced officers, and he saw no reason to refer this particular matter for report to any of the gentlemen mentioned in the question.

THE INSTITUTION MEETING AT BLACKPOOL: ORPHAN FUND.

To the Editor of The Surveyor.

Sir,—I quite agree with Mr. Frank Massie's letter in your columns last week, suggesting that surveyors who attended the meeting at Blackpool should send on their subscriptions at once to the hon. treasurer, Mr. O. Claude Robson, Municipal Offices, Dyne-road, Kilburn, London, N.W., to make up the regrettable loss that has been incurred to the Orphan Fund through no collection being made at that gathering. If ever there was a time when this fund is needed it is now. The drain upon it will be enormous.

Members should act promptly and send a subscription to-day. By the time this letter appears Mr. Robson will have received mine.—Yours, &c.,

Oswald A. Bridges,
Town Surveyor.

Council Offices,
Bognor, Sussex.
July 24, 1916.

Road Surveyors' War Bonuses.—Holland County Roads and Bridges Committee have recommended the payment to each of the district main road surveyors of a war bonus of £60 per annum for motor cycle allowance and other expenses.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

SURVEYOR AND INSPECTOR.—July 29th.—Darfield Urban District Council. £120 per annum.—Mr. W. Robinson, clerk, 17 Regent-street, Barnsley.

ASSISTANT SURVEYOR.—August 2nd.—Elland Urban District Council. £140 a year.—Mr. J. Clarkson, clerk, Council Offices, Elland.

SEWAGE FARM MANAGER.—August 5th.—East Barnet Valley Urban District Council. £2 2s.—£2 10s. per week.—Mr. T. A. Buckley, clerk, Council Offices, Station-road, New Barnet.

TEMPORARY MAIN ROAD SURVEYOR.—August 19th.—Cornwall County Council. £150 per annum.—Mr. L. D. Thompson, county surveyor, County Hall, Truro.

TEMPORARY ASSISTANT SURVEYOR.—Corporation of Tenby. 30s. per week.—Mr. B. Morley, borough surveyor, Tenby.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

GRIMSBY.—July 31st.—For the erection of a temporary fire station, for the corporation.—Mr. H. Gilbert Whyatt, borough engineer and surveyor, Municipal Buildings.

FALMOUTH.—July 31st.—For building a sea wall, for the corporation.—Mr. H. E. Tresidder, borough engineer and surveyor, Municipal Offices.

WEST HARTLEPOOL.—August 1st.—For building a boiler-house, for the corporation.—Mr. N. F. Dennis, borough engineer and surveyor.

MANCHESTER.—August 2nd.—For laying a wood block floor, for the Board of Guardians.—Mr. A. J. Murgatroyd, architect, 23 Strutt-street, Manchester.

BRIDGNORTH.—August 10th.—For work in connection with the construction of a wall at Winterburn Bridge, for the rural district council.—Mr. F. Richards, surveyor Oldbury, Bridgnorth.

Engineering: Iron and Steel.

DEWSBURY.—August 3rd.—For the supply of steam piping and fittings, for the Board of Guardians.—Mr. C. P. Pickersgill, clerk, Union Offices, Wellington-street, Dewsbury.

HALIFAX.—August 5th.—For the reconstruction in reinforced concrete of Clark Bridge, for the corporation.—Mr. J. Lord, borough engineer, Town Hall.

SINGAPORE.—August 14th.—For the construction of a steel bridge, for the Public Works Department.—Chief Clerk, Colonial Engineer's Office, Singapore.

Roads.

BERKHAMSTED.—July 31st.—For the supply of flints, for the urban district council.—Mr. J. R. Hadfield, surveyor, 135 High-street, Berkhamsted.

BROADSTAIRS.—July 31st.—For the supply of 500 cubic yards of pit flints, and 160 cubic yards of pit gravel, for the urban district council.—Mr. H. Hurd, surveyor.

TOTNES.—August 1st.—For ripping and breaking stone and hauling, for the rural district council.—Mr. H. Vickery, highway surveyor, Antrim-terrace, Totnes.

NORTHWOOD.—August 1st.—For the supply of 700 tons of tarred slag macadam, 600 cubic yards of hand-picked brick or good concrete hardcore, and clean clinker, for the urban district council.—The Surveyor.

LEATHERHEAD.—August 1st.—For the supply of 130 tons of 2½ in., 60 tons of 1¼ in., 15 tons of ⅜ in. of slag macadam, and 8 tons of slag dust, for the urban district council.—Mr. Sidney R. Drake, surveyor, Council Offices.

ALDERSHOT.—August 1st.—For the execution of haulage work, for the urban district council.—Mr. F. C. Uren, surveyor, Municipal Buildings.

BASINGSTOKE.—August 10th.—For steam rolling, for the rural district council.—Mr. R. Forrester, surveyor, Chequers-road, Basingstoke.

ROMFORD.—August 14th.—For the supply of 920 tons of granite, for the rural district council.—The Highway Surveyor, 16a South-street, Romford.

JOHANNESBURG.—August 14th-15th.—For the supply of 1,600 tons of tar or tar substitute, for the municipal council.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, E.C.

LONDON.—August 15th.—For the supply of 370,000 creosoted deal paving blocks, for the county council.—Chief Officer, L.C.C. Tramways, 62 Finsbury Pavement, E.C.

Sanitary.

LANCHESTER.—July 31st.—For cleansing closets and ashpits, for the rural district council.—Mr. J. R. Lupton, surveyor, Lanchester.

TICKHILL.—August 1st.—For the removal of house refuse, for the urban district council.—Mr. J. Walker, clerk.

Stores.

GOSPORT.—August 10th.—For the supply of artificial stone paving, broken stone for macadamising, brooms, castings, cement, lime, disinfectants, stoneware pipes and ironmongery, for the urban district council.—The Surveyor, Town Hall.

ROCHESTER.—September 5th.—For the supply of road metal, brooms, horse hire, and tools, for the corporation.—Mr. W. Banks, city surveyor, Guildhall.

Miscellaneous.

WARRINGTON.—August 2nd.—For the supply of a two-stroke motor bicycle, for the corporation.—Mr. F. V. L. Mathias, borough electrical and tramways engineer, Howley, Warrington.

HOLLINGBOURN.—August 3rd.—For rebuilding the side of a bridge, and erecting oak fences, for the rural district council.—Mr. H. J. Bracher, clerk, 33 Earl-street, Maidstone.

PLYMOUTH.—August 7th.—For the supply of a motor van, for the corporation.—Chief Constable, Central Police Office.

WARSOP.—August 14th.—For laying out a portion of the new burial ground, for the urban district council.—Messrs. Vallance & Westwick, White Hart-chambers, Mansfield.

The Surveyor

And Municipal and County Engineer.

Vol. L. AUGUST 4, 1916. No. 1,281.

Minutes of Proceedings.

The Sheringham Meeting: Coast Protection.

A highly successful meeting of the Eastern Sub District of the Institution of Municipal and County Engineers was held at Sheringham last Saturday, when a paper descriptive of the municipal works of the district was read by Mr. F. Hall Smith, P.A.S.I., the surveyor to the urban district council. Sheringham is charmingly situated on the Norfolk coast, and in recent years has made considerable strides as a watering-place. The manner in which the development of the town has been guided by the council and its officials reflects no little credit on all concerned, and augurs well for increased prosperity with the return of normal conditions on the East Coast. For example, it may be mentioned that the sewerage system is constructed on modern lines; the building by-laws were revised two years ago; new council offices have been recently erected; and adequate public conveniences have been provided. It is perhaps worthy of note that the revised by-laws contain a provision exempting reinforced-concrete walls from the thickness required for brickwork, provided that they have the strength necessary to secure due stability. This form of by-law ought at least to be satisfactory to the council, as it apparently leaves them to say in each case whether the proposed construction complies with the by-law.

Both in Mr. Hall Smith's paper, and in the discussion which followed, considerable attention was given to the subject of coast protection, which is of supreme importance locally. The original sea wall and promenade at Sheringham were constructed in 1899-1900, at a cost of £19,950. Nine years later it was found necessary to extend the wall over a hundred yards eastward to the East Groyne, as the sea was getting behind the old works. This was carried out by direct labour, at a cost of £1,155. Further works were again found to be necessary after the great rainstorm of August, 1912, which caused so much damage in Norfolk. On that occasion no less than 5½ in. of rain fell at Sheringham, and the lower portion of the cliffs at the west promenade were washed on to the beach. To meet this situation Mr. Hall Smith recommended the construction of a raised promenade and shelter, the total cost, excluding the shelter, being £765. The effect of the cost of these sea defence works on the rates may be fairly estimated if it is borne in mind that the present rateable value of the district is approximately £23,000, a penny rate producing less than £100. It is hardly surprising therefore that Mr. Hall Smith should have concluded this part of his paper with a plea for some form of Government assistance towards works of coast defence, which, after all, are of national as well as local importance. Sheringham does not stand alone in this matter, as was clearly shown by the trend of the discussion. For example, Mr. J. S. Hurst, in expressing agreement with Mr. Hall Smith's views as to Government aid, pointed out that Southwold has up to the present sunk a capital sum of £23,500 (considerably more than the rateable value of the town) in fighting the sea, this amount not including any elaborate promenades, but being simply for necessary works. It will be seen therefore that in the case of small seaside towns on the East Coast the burden placed on the rates by the execution of necessary coast defence works is wellnigh intolerable. It may be said that the value of the land saved is not worth the cost involved, but surely this is rather a narrow view to take. It must be remembered that when once land has been lost to the sea it can never be regained. The predominant interest is, of course, the local one, and it is not suggested that the whole cost of sea defence works should be charged to the national exchequer. Unless some measure of assistance is given, however, the result must be that no work at all will be undertaken in many districts, while in others financial considerations will lead to an undue restriction. Even where, as at Sheringham, a bold policy is undertaken, the resulting burden is such as no body of local ratepayers in a small town ought to be called upon to bear unaided.

* * *

Progress in the Treatment of Sewage.

The brief, but excellent, review of the history of sewage disposal which was given by Dr. Barwise in his presidential address at the recent annual summer conference of the Association of Managers of Sewage Disposal Works at Sheffield, led up to, and dealt largely with, the latest method of treatment by

means of activated sludge. One of the other two papers read at the same meeting gave some very interesting results of experiments carried out at Sheffield with the same process. From these two papers, which appeared in our issue of July 14th, it will be seen that aëration, or the blowing of air into the sewage, is actually only needed for the purpose of activating the sludge. In most cases, up to the present, air has been used both for activating the sludge and for bringing it into intimate contact with the whole of the sewage, and this has without doubt been the cause of the comparatively large volumes of air required, and consequently of the high cost of the process. Dr. Barwise holds the view that the amount of air used by this method is in excess of what is required for aëration. Mr. Haworth, the author of the second paper, who is manager and chemist of the sewage disposal works at Sheffield, after carrying out various experiments in the aëration of the effluents from primary contact beds by what may be termed the older methods, and later with the addition of activated sludge, came to the conclusion that as only a small proportion of the air is used for oxidation in activating the sludge, and the larger proportion for mixing the sludge with the sewage, it might prove to be more economical to use mechanical means for the latter purpose. He then devised an ingenious apparatus, described in the paper, by means of which the sludge and sewage are continuously being mixed, and at the same time a small definite quantity of air is carried into the liquid at regular intervals, all by mechanical means and without the use of an air compressor. Mr. Haworth claims that the results of this experiment show that the aëration by minute bubbles of air, such as through porous tiles, is unnecessary, and that mechanical circulation, combined with minimum aëration, is efficient. Although the mechanical apparatus devised by Mr. Haworth is small, and may need considerable modification before it can be adapted for dealing with large volumes, it confirms the principle of the process as already established, and demonstrates that the use of compressed air is not essential. This is a great step in advance, and, as stated by Dr. Barwise in his address, it opens up a new field for thought. Instead of confining their attention to overcoming the difficulties which had arisen in the economical application of compressed air for activating the sludge and thoroughly mixing it with the sewage, engineers may now turn their energies in the directions indicated by Dr. Barwise. Some of the older methods of aëration, combined with mechanical agitation of one sort or another, may be found to be suitable, and the greater the number of experiments that are made, even if many of them fail to secure entire success, the sooner shall we arrive at a method, or combination of methods, which will prove to be both efficient and economical.

Animals Straying on the Highway.

The question of the liability of the owner of animals straying on the highway for an accident caused by their presence is one that has been the subject of several judicial decisions. Under sec. 25 of the Highway Act, 1864, the owner of certain specified animals found straying or lying on any highway is liable to a penalty not exceeding 5s., plus the expense of removing the animals either to the owner's stable or to the common pound. But this is the only liability imposed by this enactment, and it applies indiscriminately, whether any accident or damage has been caused or not, and irrespective of any question of negligence. In *Hadwell* v. *Righton* (1907, 2 K.B., 345) an accident was caused to a cyclist by some fowls which had been frightened by a dog, and it was held that the owner of the fowls was not liable, the accident not being the natural consequence of their being on the road. In *Higgins* v. *Searle* (100 L.T., 280) the Court even went so far as to say that an animal straying on the highway is one of the ordinary risks taken by users of the highway. In *Ellis* v. *Banyard* (1911, A.C., 10) a cyclist was injured by some cows which had strayed through an open gate, and it was held that, in the absence of proof of negligence, the owner was not liable. And in *Jones and Another* v. *Lee* (28 T.L.R., 92), where a horse escaped from a field, owing to defective hedges, and injured a pedestrian, the owner was absolved from liability.

The question again came up for consideration in the recent case of *Heath's Garage, Limited, and Another* v. *Hodges*—noted in our issue of June 30th—which is of considerable interest. This was an action for damages for injury to the plaintiff's motor-car by a sheep belonging to the defendant under the following circumstances: The car was being driven along a public highway near Kenilworth, at the moderate pace of between 16 and 20 miles an hour, when the driver saw on the road, about 200 yds. ahead, a number of sheep (which had strayed from the defendant's land through a gap in his fence). The driver put on his brakes, and most of the sheep got to one side of the road, but two jumped from a bank on the near side, and one of these collided with the car and damaged the steering gear. The defendant was convicted and fined under sec. 25 of the Highway Act, 1864, but, of course, this in itself was not proof of negligence on his part, since that section applies (as already indicated) to the owner of sheep (and other specified animals) found straying or lying about on a highway, whether the animal's presence is attributable to any negligence on the part of the owner or not. The judge of the Warwick County Court held that the defendant had been guilty of negligence, or at all events of committing a nuisance in allowing his sheep to stray on to the road, and that the accident was the natural consequence of such negligence, and he gave judgment for the plaintiffs. This decision, however, was reversed by the Divisional Court, and such reversal was affirmed by the Court of Appeal. In delivering judgment in that Court, Lord Cozens-Hardy cited *dicta* showing that, at common law, the owner of land adjoining a highway is not under any obligation to fence his land, so as to prevent animals from straying on to the road, and that in ordinary circumstances there is no duty to prevent harmless animals like sheep from straying on to the highway. It was true, said his lordship, that under the Highway Acts, 1835 and 1864, penalties might be imposed on anyone whose cattle were found straying on the road—that was a new remedy given for the protection of the public—but it did not render a man liable to an action at law; the fine imposed by the justices was the only remedy available. To the plaintiffs we should think this last suggestion must sound rather a mockery, and there seems to us to be something anomalous in the state of the law with respect to this matter as laid down in this case.

* * *

An Important Question.

On Monday last Mr. Justice Bray concluded the hearing of the case of the *Metropolitan Water Board* v. *Messrs. Dick, Kerr & Co., Limited*, which arose out of the action of the Ministry of Munitions in temporarily stopping certain works so as to divert the labour to Government work for the period of the war. It appears that in July, 1914, the defendants contracted to construct for the plaintiffs certain works known as the Littleton reservoirs. They began the undertaking and continued at work until February, 1916,

when they were stopped by the Minister of Munitions, acting under the Defence of the Realm Act. Being unable to continue, they now contended that the contract was at an end; but the plaintiffs wished the contract to remain in force and asked for a declaration that it was still in existence and binding. A further point raised turned on a clause in the contract which provided that tools, plant, and materials brought on the site by the defendants should become the property of the plaintiffs until completion of the work, and should not be removed without the plaintiffs' consent. The defendants had disposed of certain tools, plant, and materials which they had had on the site before the stoppage, and the plaintiffs asked for damages for conversion. By their defence, the defendants contended that by reason of an order to stop work received from the Minister of Munitions they could not go on with the contract. Its further performance became impossible and illegal, and it came to an end.

The actual facts in regard to the stoppage were that on February 21, 1916, the Minister of Munitions gave notice to the defendants that they were not to employ any more workmen for the time being, as they were wanted elsewhere. Certain machinery and material, for which the sum of £40,000 was received, were also requisitioned and sent to various parts of the country. In the result, his lordship held that the contract was not abrogated, that under Clause 10 all the plant which came upon the site became the limited property of the board, and that defendants were not bound to repay the money already received from the Ministry of Munitions. He granted an injunction against Messrs. Dick, Kerr & Co. removing any machinery or receiving the proceeds of the sale of any machinery removed, or which might hereafter be removed, except so far as they were acting under the order of the Ministry of Munitions. The decision is of very great importance to local authorities, and particularly to the Metropolitan Water Board, as that body has several other large works in hand which have been stopped under similar circumstances.

* * *

Surveyors and Highway Policy.

The question of highway policy and the position of the surveyor in connection therewith was discussed recently (we gather from the *Coventry Herald*) by the Meriden Rural District Council upon a report from the Highways Committee, giving details of certain works. The exact point at issue was the extent to which in the present abnormal circumstances it is necessary or desirable to limit the work of tar-painting. The report of the committee was based upon the necessity for immediate economy, and it was vigorously opposed by certain members on the ground that, although tar-painting unquestionably involves immediate expense, that expense is justifiable in view of the ultimate saving upon road maintenance. It will be readily understood that we have not the least desire to quarrel with this view, but at the same time it was distinctly unfortunate that its advocates should have attempted to make the discussion an opportunity for attacking the surveyor. It appears that the committee in reporting as they did were influenced by the request that has been made by the Government for restriction in the use of tar, and in spite of this fact it was suggested by certain members that it was the duty of the surveyor to dictate to the committee, and that he was in a measure personally responsible for the report. One member went so far as to express the opinion that the surveyor should do something to bring the matter definitely before the council and get their decision; and this, apparently, in spite of the fact that the council already had under consideration a report of their Highways Committee on the subject. Whatever view may be taken as to the correctness of the opinion expressed in the report of the committee, we imagine that it will be generally agreed that in a matter of policy of this kind it is no part of the duty of an official to report to the council behind the back of his committee, even if he thinks the latter body to be in the wrong. The proper course to be followed by the council if they require a report from the surveyor direct to themselves is obviously to pass a resolution to that effect and to take the matter out of the hands of the committee to which it has been referred and with whose report they may disagree. It is satisfactory to observe that the attack on the surveyor did not succeed, and that the report of the committee was ultimately adopted.

* * *

Branston Rural Surveyors Under the Harrow.

The surveyors to the Branston, Lincs, Rural District Council have been evidently experiencing lately a sample of the tender mercies of the local councillor clothed in brief authority. With reference to certain proposed new works in the district, the War Office, through a divisional officer, requested that the council's surveyor, Mr. T. R. Howitt, should undertake the duties of clerk of the works, and it was recommended that he be paid £46 per annum, the difference between his Army pay and his present salary. The surveyor told the council that he would have ample time to devote to certain council work, and manifestly the proposed bargain was not a bad one for the council or for the nation. Even this fact could not restrain a councillor from indulging in a series of sneers, during which he remarked sarcastically that it was a "very good arrangement" (for the official), and that he "was only thinking it would be too economical for the War Office." Then another member chimed in with the graceless remark that as the other surveyors "had very little to do" they might have liberated Mr. Howitt and done the work themselves, which the councillor who first spoke agreed with. This elicited a protest from Mr. J. W. Watson, one of the surveyors concerned, and Mr. Howitt backed him up in replying to other criticisms, saying it was evident that one of the critics knew nothing about the work he had to do. This tempted the councillor to a Parthian rejoinder that "he still maintained Mr. Howitt had a far better job than most surveyors. He had a very good job. If he could get a better he would be gone to-morrow." Considering what they have to put up with from councillors, it would not be surprising if the Branston surveyors acted upon this latter suggestion; but meanwhile it is at all events consoling to note that they follow the commendable practice of countering abuse with a dignified and spirited defence.

Electricity Supply Economies.—In the House of Commons the Secretary to the Board of Trade was asked whether a circular had been issued by his department urging an arrangement to merge electrical supplies with a view to saving coal. Had he considered that new cables and other expense might be necessary to enable such plans to be carried out, involving capital expenditure; and would enabling legislation be introduced to render possible the desirable economies which the Board of Trade wish to effect in cases where statutory authority would be required? Mr. Harcourt said the answer to the first two portions of the question was in the affirmative. In issuing the circular the Board of Trade had not in mind any large schemes of interconnection involving heavy capital expenditure and a large use of material, but rather contemplated arrangements between undertakers whose areas of supply adjoined, or nearly so. He did not think that legislation for this purpose was requisite, but should the necessity for it appear to arise, he would be prepared to give the matter full consideration.

Sea Front Improvement at Exmouth.

A NEW MARINE PARADE.

Exmouth's New Marine Drive.

Since his appointment some thirteen years ago, Mr. Samuel Hutton, in his capacity as surveyor and water engineer, has done much to add to the attractiveness of Exmouth from the point of view of the holiday maker. Evidence of his activities was not wanting when in May, 1912, the members of the Institution of Municipal and County Engineers paid a visit of inspection to the town, and the intervening period, despite the advent of the war, would seem to have witnessed no diminution of his efforts. At the present time he is engaged in the carrying out of an important work of improvement in the shape of a new marine drive, which, when completed, will be a lasting monument to his skill as an engineer and to the enterprise of the local authority whom he serves with such conspicuous ability. The magnitude of the undertaking will be appreciated when it is stated that a sum of more than £30,000 will be expended in its execution; and in no small measure the carrying out of the scheme has been made possible by the generosity of Lord Clinton, the owner of the foreshore and beach. The new work is divided into three sections, one part, built by Lord Clinton, consisting of a bulk concrete wall about half a mile in length, with certain sloping of the cliffs; a second part, built by the urban council, consisting of a reinforced concrete and masonry sea wall of approximately the same length; and the third part, the construction of a reinforced concrete carriageway about a mile in length with concrete footpaths (partly reinforced) behind the two walls, this also being carried out by the council under the supervision of Mr. Hutton. Both walls have been carried down to the same level—viz., 2 ft. below ordnance datum, or low water neap tide level.

The wall constructed by Lord Clinton was begun in the spring of 1915 and completed last summer, while that undertaken for the council, which adjoins his lordship's wall, was commenced in May last year and finished a little over two months ago. The former wall is of mass concrete construction and affords a good example of heavy concrete work. The sloping of the cliffs, which has presented the usual difficulties in dealing with marl formation, is on the point of completion, and there is every evidence that the sloping will be effectual and at the same time will not have seriously destroyed the rugged appearance of the high land, so much a feature of the scenery in this part of the country.

The council's wall is of the slope type. The protection of the base is of reinforced concrete sheeting, the reinforcement being expanded metal mesh, supplied by the Expanded Metal Co., Limited, Westminster. The whole of the trench was excavated and the sheeting constructed in situ, thus avoiding the gaps which are common where piles are driven into beach gravel. From the beach the work is faced with rough limestone, reinforced with expanded metal and surmounted by a rounded parapet, which is about 2 ft. 6 in. above the promenade footpath. Bastions placed at regular intervals give an effective appearance to the wall, while stepways and a slipway give access to the beach.

Before the carriageway and footpaths behind the walls were begun, a trial section was laid down, and was subjected to a year's traffic, during which time 1,500 tons passed over it. The concrete is being laid on the sand to a depth of 5 in., reinforced in the centre with expanded metal laid longway of mesh from kerb to kerb. The sheets are overlapped not less than one mesh at joints to obtain continuity of reinforcement and the overlaps are not made in continuous lines, but are staggered. By the use of expanded metal reinforcement it is calculated that something like 4 in. of additional concrete has been dispensed with. The width of the carriageway is 39 ft. 6 in., while the footpaths cover an additional 25 ft. The roadway is being constructed in 24 ft. lengths, with felt expansion joints between each bay, while alongside the kerbs a wood feather-edge strip is placed, and afterwards withdrawn, and the space filled with sand and tar. Unwashed beach gravel, mixed with filtered sea water, is being used for the concrete. The surface of the carriageway is afterwards treated with distilled tar and beach grit, which gives quite a pleasing finish. It is anticipated that the council's section of the parade will be completed in the course of a few months.

On Saturday last members of the South-western District of the Institution of Municipal and County Engineers visited Exmouth for the purpose of inspecting the works above described, those present including Messrs. James Paton (Plymouth), district chairman, T. Moulding (Exeter), C. K. Henderson (Pewsey Rural), C. D. Bell (Camborne Urban), A. J. Mildon (Tiverton Rural), J. Siddalls (Tiverton), R. M. Stone (Devon County), G. Saunders (Tiverton), A. Woodgates (Tiverton), Owen Baines (Paignton), G. Paraford (Exmouth), R. A. Rogers (Newton Abbot Rural), C. D. White (Newton Abbot Urban), F. J. Harris (Bideford), C. R. Cole (Somerset County), R. H. Wymond (Exeter), J. Bennett (Exeter), W. P. Robinson (Devon County),

F. E. Simpson (Heavitree Urban), S. Hutton (Exmouth), E. Parr (Bridgwater), W. E. Dean (Exmouth), J. T. Pierce, J. Moore and H. Baines, and D. Edwards (Taunton), hon. district secretary.

Assembling at the council offices, the visitors were accorded a hearty welcome to the town by Councillor Kemp, chairman of the urban district council, and by Councillor Crews, chairman of the Roads Committee. The subsequent inspection, which was favoured by delightful weather, proved of the greatest interest, work being actually in progress when the members arrived on the scene. Tea was afterwards provided at the Undercliff Tennis Pavilion by Councillors Kemp and Crews, Mrs. Kemp, who presided over the arrangements, having the assistance of Mrs. Paton, Miss Crews, Miss Tatcham and Mrs. Hutton.

In returning thanks on behalf of the members, Mr. Paton remarked that a most enjoyable afternoon had been spent in examining the work upon which Mr. Hutton was engaged, and they were greatly indebted to the latter for having arranged the meeting. It was an extensive scheme for a town of the size of Exmouth to embark upon, and they were very fortunate in having had an opportunity of seeing such a work while it was in progress. In that connection their thanks were due to the contractors, Messrs. P. Wilson and Company. The data and costs which would be available when it was completed would be most valuable.

In returning thanks, Mr. Hutton said that, in view of existing conditions, he regarded the large attendance that day as a great compliment, and he realised that it must have been only with considerable difficulty that many had been able to be present.

We understand that when the whole scheme is finished it is the intention of Mr. Hutton to prepare a paper, giving full details of the cost of the works visited last Saturday, and an account of the many interesting problems which have arisen during their progress.

THE POSITION OF TEMPORARY ASSISTANTS.

LONDON COUNTY COUNCIL COMMITTEE'S RECOMMENDATIONS.

The Establishment Committee of the London County Council, in a recent report, state that they have had under consideration the question of the position on retirement of temporary assistants. "The approximate permanence of a large bulk of the council's work can," the committee observe, "be gauged with accuracy, and can be met by the appointment of permanent and unestablished staff in appropriate proportions, but there constantly appears and disappears a considerable quantity of work of varying character, the needs of which can best be met by the employment in a purely temporary capacity of staff as to whom freedom of engagement and discharge is quite unrestricted. In the organisation of a large staff the usefulness of temporary as distinguished from permanent and 'unestablished' staff lies chiefly in the means which it affords for dealing, without delay or extravagance, with this fluctuating work, and it appears probable that the exigencies of the council's work will in the future, even more than in the past, render desirable the existence of temporary staff. In nearly every class of temporary assistants there are men who have been employed continuously for considerable periods, and we have therefore directed our attention to the questions—(1) whether it is desirable that such a state of affairs should continue, and (2) if not, (*a*) what action should be taken as regards men who already have had long service, and (*b*) what steps should be taken to prevent its recurrence."

As regards the first question, the committee are strongly of opinion that, apart from those classes of temporary assistants who are appointed under special schemes—*i.e.*, tramways and stores departments—and those assistants who are classed or are to be classed "unestablished," temporary assistants should not be allowed to continue in the council's service for such a period as to lead them either to think that they will be employed indefinitely or to expect any special treatment on retirement.

The question of the action to be taken as regards temporary assistants who have already had long service presents some difficulty. The main distinction between the permanent and temporary staff has hitherto been the requirement that the former shall contribute to the superannuation and provident fund, and the committee consider it desirable on all grounds that this distinction should be maintained. They think that the case of men who have had fifteen or more years' continuous service, and who are fifty or more years of age, should be distinguished from other cases, and that the council might reasonably agree to extend the operation of the principle already approved of retaining certain assistants after they have attained the age of sixty five years by deciding that such temporary assistants *shall* be retained, where practicable, from year to year after attaining the age of sixty-five years, and they submit a recommendation to give effect to this proposal so far as temporary assistants, eleven in number, under their direction are concerned. The assistants so retained would not necessarily continue to be employed in the department in which they were serving at the time of their attaining the age of sixty-five years, and their retention, which, as indicated above, would be from year to year, would of course be dependent on the need for assistants and the existence of authority for the employment of such assistants. In some cases this might result in the rate of pay of an assistant after retention being less than the rate previously received. Their retention after attaining the age of sixty-five years would also, of course, be subject, as at present, to the committee being satisfied that they are capable of performing efficiently the duties assigned to them.

As regards the remaining temporary assistants under their direction, the committee have approved proposals as follows: (1) That a strict limitation shall be placed upon both the continuous and the aggregate period during which a particular assistant may be temporarily employed; and (2) that the number of temporary assistants employed shall be reviewed as far as possible at the same time as the annual review of the fixed staff.

BRANSTON RURAL COUNCILLORS AND THE SURVEYORS.

The War Office, through a Divisional Officer, asked the surveyor of the Branston, Lincs, Rural District Council, Mr. T. R. Howitt, to undertake the duties of clerk of the works in connection with certain new works pending in the district. The council were recommended to pay Mr. Howitt £46 5s. per annum, the difference between his Army pay and his present salary. When the matter came before the council recently the surveyor, answering the chairman (the Rev. R. E. G. Cole), said he commenced this work on the previous Monday. He thought he had the routine of it now, and there would be ample time to devote to council duties. He could not see that there would be any difficulty whatever.

Mr. W. G. Marshall: A very good arrangement. I was only thinking it would be too economical for the War Office.

Mr. W. Bartholomew thought the district surveyors could have liberated Mr. Howitt and done the work themselves. They had very little to do at the present time.

Mr. Marshall spoke in similar strain.

Mr. J. W. Watson, one of the district surveyors, said he must protest against the remarks of Mr. Marshall. He (Mr. Watson) had never worked as hard as he was doing now. He did a great deal of work, and work for nothing, that many people had little idea of. He had done his duty right along.

Mr. Marshall said he noticed that for one month Mr. Watson had paid in the noble sum of £21 13s.

Mr. Watson said a surveyor's work did not rest with that. He had had to go over every yard of road more than if he had twenty or thirty men working for him.

Mr. S. Horton moved that the £46 5s. be paid, subject to revision if necessary, and proceeded to refer to the work done by Mr. Howitt.

Mr. Howitt said from the remarks made by Mr. Bartholomew now and for several months past it was very evident he knew nothing about his (Mr. Howitt's) work. He could not undertake the whole of the work of the council while working for the War Office. He could look after cases of infectious disease, very urgent work, the Boultham sewage scheme, and so on. It would be an impossibility to look after the whole of the work.

Mr. Bartholomew said he still maintained that Mr. Howitt had a far better job than had most surveyors. He had a very good job. If he could get a better he would be gone to-morrow.

Mr. Horton's motion was eventually adopted.

Nine Years' Work at Sheringham, Norfolk.*

By F. HALL SMITH, F.A.S.I., Surveyor to the Urban District Council.

Sheringham as a watering-place dates back twenty years, but previously the fishing village had a fair share of visitors who came for quiet and the bracing air. The growth of the town is due to the enterprise of the Squires of Sheringham and Beeston and local builders. There are no works of very great magnitude, but 100 yds. of sea wall requires as much thought and care as 1,000 yds. . . . The district was made an urban district in 1902, previously being under the Erpingham Rural District Council.

GENERAL AND VITAL STATISTICS.

Area, 887 acres, excluding foreshore. 1901 -population, 2,359; houses, 713; rateable value, £15,841. 1911—population, 3,376; houses 1,000; rateable value, £22,997.

The census is taken when the large houses are unoccupied, and the estimated season population is 10,000 to 12,000.

In 1915 the rateable value was £25,434, but owing to the war this has been reduced to £21,386, and will be readjusted when times are normal on the East Coast.

This is a remarkably healthy district, and the average death-rate at all ages for the last fourteen years is 10·94 per 1,000, ranging from 7·83 in 1913 to 14·4 in 1906.

GAS AND WATER SUPPLY.

Gas and water are supplied by the Sheringham Gas and Water Company. The lamps, &c., are the property of the council, who pay the company for gas consumed, lighting and maintenance.

SEWERS.

The whole of the sewers are of stoneware socketed pipes, varying from 6 in. to 12 in., and are well laid; total length about 12 miles.

The outfall is 12-in. cast iron, socketed above high-water mark, and flanged below. This discharges 1,000 ft. from the sea wall, and has been lengthened since 1907 336 ft., to well below low-water level of spring tides.

In 1901 the rural district council constructed a septic tank, which exploded in 1903, and the chambers were filled in and covered over. In summer the sewage is screened, ⅝-in. and ¾-in. mesh screens being fixed, and the solids are carted away at night.

In 1914 a 6-in. sewer was completed to connect Beeston Common estate with the main system, for which the prices were as follows:—

Excavation to 6 ft. = 1s. 6d. per cubic yard; 6 ft.-9 ft. = 2s. Very poor prices for wet, clayey soil.

775 lin. yds. 6-in. pipe (cost 1s. 3d. at station) = 3s.

Manholes, £1 per foot in depth, size 4 ft. 6 in. by 2 ft. 6 in. clear.

Square covers, 1 ft. 10 in. by 1 ft. 10 in. = 45s. each.

The author prefers square covers, as entry to manholes is much easier and not so dirty as in the case of round covers. No gullies were fixed, as a stream runs alongside whole length. Total cost, £401 8s. 2d.

In 1914 sanction was obtained for a loan of £900 for a surface-water sewer for portion of town north of railway, between and including Church-street and High-street and Beeston-road, but the work has not been carried out yet.

Prices.—Excavation to 6 ft. deep, 3s. per cubic yard.

304 lin. yds. 6-in. pipe ...	cost 1s. 3d. ...	3s. 0d.
654 lin. yds. 6-in. pipe ...	cost 2s. 6d. ...	4s. 6d.
266 lin. yds. 12-in pipe ...	cost 4s. 1½d. ...	6s. 6d.

Gullies, £6 each connected.

Manholes, £1 per foot in depth.

Make good tar-macadam roadways, 2s. per super. yard.

The sewers are ventilated by means of vent shafts 30 ft. to 40 ft. high, according to surroundings; but there is by no means sufficient ventilation yet—when making up new roads the author includes vent shafts in the work.

HIGHWAYS AND FOOTWAYS.

The total length repairable by the council is 10 miles. The county council repair and scavenge the county roads, which is a very unsatisfactory state of affairs.

The greater portion of the streets have been made up during the last fifteen years; they are sewered by the landowners before houses are erected.

Specification of Roadways.—3-in. by 12-in. patent stone kerbs and channels, 3s. per yard, laid on concrete bed 3 in. thick. Whole flint foundation 5 in. thick, and broken flint topping 4 in. thick, with marl and gravel binding = 2s. 4d. per super. yard. Gullies and vent shafts.

Paths.—2½-in. tar paving on 3-in. foundation in the town, and 2½-in. gravel on 3-in. foundation outside the town. The author introduced concrete in situ for paths, owing to less cost of repairs and probable shortage of tar = 2 in. thick of 6 to 1 concrete, finished with ¼-in. granite chippings and cement, 6 to 1. This cost 2s. 3d. per super. yard, which was the same price as tar-macadam.

The roadways wear from six to ten years, and when repaired are scarified, levelled, rolled, and covered with sufficient 2½-in. tar-macadam to cover the surface when rolled, grouted with tar and spread with a good thickness of gravel, the excess of which is swept off when it has worked in. This makes a splendid surface, and only requires tarring every three years.

One ton of tar-macadam covers 12 to 14 super. yds., and cost was 1s. 6d. to 1s. 8d. per super. yard, when tar-macadam cost 14s. 9d. at station, and gravel 2s. 6d. on site.

Back passages are made up with 3-in. by 9-in. patent stone kerbs, and 4-in. tar-macadam on 4-in. whole-flint foundation.

Loans are obtained for the amount of the cost of making up roads, which the frontagers do not pay when the final apportionment notice is sent; the frontagers are allowed to pay in half-yearly instalments for seven years, adding 4 per cent interest, which is a great convenience to small owners.

Owing to the unsatisfactory way in which the gas and water company repaired their trenches, it was agreed to take over the trenches when filled in and repair the surfaces at the following prices: Tar-macadam, 2s.; granite, 1s. 6d.; flint, 1s. per super. yard.

BY-LAWS.

The building by-laws were the old Model Series of the Local Government Board, but two years ago they were revised and added to as follows:—

Reinforced-concrete walls exempt from thickness required for brickwork, but must have strength necessary to secure stability.

External walls may be 4½ in. less in thickness if built in cement, and cross walls 4½ in. less than external walls, but in no case less than 9 in. thick.

Walls of outbuilding not used for human habitation, not more than 8 ft. high and 10 ft. long, may be 4½ in. thick if built with cement mortar.

Floor boards may be laid direct on to concrete and nailed.

Outside water-closet to be provided, with opening for light and ventilation (window not necessary), and must have supply of water.

Movable ashbins to be provided of galvanised iron with covers.

Surface water from roof to be carried off by eaves gutters and down-pipes.

Height of rooms 8 ft. at least if not in roof; if in roof, 7 ft. 6 in. for two-thirds floor area, and in no part less than 4 ft.

DEPOT AND STOREYARD.

In 1908 ½ acre of land was purchased for £175, on which were erected sheds for vans and carts, tar-macadam shed, joiner's shop, general store, cement store, and fire station, at a cost of £600.

The author has since erected a 2,000-gallon tar tank with ½-in. round indented bars, floor 6-in. thick, walls 5 in., top 4 in., at a cost of £19 18s. 6d. The bars cost £6, cement 27s. per ton, granite chippings 11s., and sharp sand 1s. 6d. per load.

PROMENADE AND PROTECTION WORK.

The total length of sea-board is 1½ miles, the promenade and sea wall extending ¾ mile, protected

* From a paper presented at the Eastern Sub-District (Norfolk, Suffolk, and Cambridge) meeting of the Institution of Municipal and County Engineers at Sheringham on Saturday last.

by eleven groynes, six of which are the property of the council and five of the lord of the manor. The average erosion on this coast is 1 yd. per year.

The original sea wall and promenade were constructed in 1899-1900, at a cost of £19,950, a section is given in Fig. 1.

The cliffs consist of clayey sand, which when wet turns to thick mud, over blue clay, over marl, which comprises the sea bed.

In 1909 the wall was lengthened 113 yds. eastward to the east groyne, as the sea was getting behind the old wall. This was carried out by direct labour, at a total cost of £1,155. The sea wall, promenade and retaining wall cost about £9 per lineal yard, including excavation, cement costing 30s., and gravel and stone 3s. per load. For section see Fig. 2.

At the same time the east groyne was lengthened 250 ft. to below low-water mark, at a cost of £200, with 6-in. by 6-in. piles every 8 ft. and 3-in. by 12-in. planking. Piles driven 6 ft.

The author's experience of case groynes is that from slipping by struts from the back of the original promenade to the back of footings of the retaining walls. These struts are 18 in. wide and 8 ft. apart, of 8 to 1 concrete. Beach stones were used for this contract, and sufficient sand was found in the cliffs.

Cost of shelter, £284 17s. 6d.

Cost of wall and promenade, 115 lin. yds., £765 2s. 6d., including four flights of approach steps.

Compare cost of this shelter with the one constructed with reinforced concrete, and which is the same size exactly.

With respect to loans for protection work, the following are amounts of repayments:

1902-3. Principal, £366; interest, £638; rate, 1s. 1d. 1908-9. Principal, £649; interest, £625; rate, 1s. 1d. 1915-16. Principal, £665; interest, £578; rate, 1s. 3d. on reduced assessment, and 1s. if assessment had not been reduced.

It will be seen that this is a great tax on a small, growing place, and the author certainly thinks that

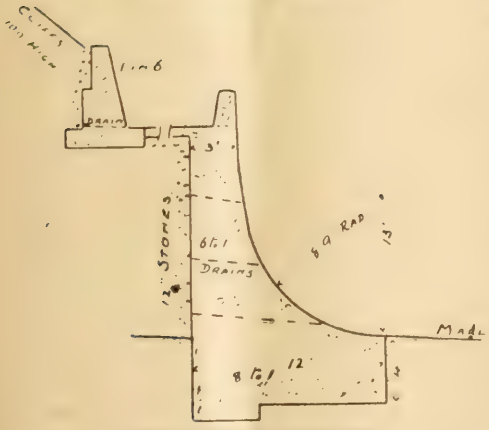

Fig. 2.—Walls, &c., Erected 1908.

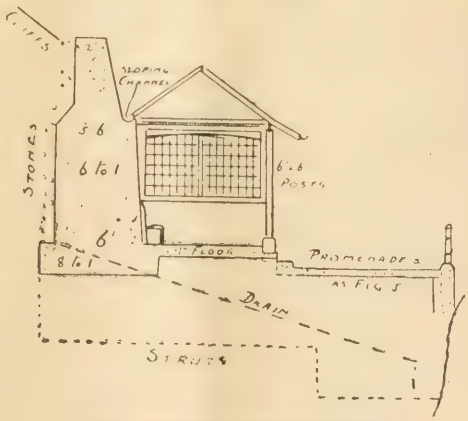

Fig. 4.—Shelter and Raised Promenade.

Sheringham Sea Wall and Promenade.

the beach is washed away round the shore end, so in 1908 he extended both to the sea wall with 6-in. by 6-in. piles, driven 6 ft., and 3-in. by 9-in. sheet piles, driven 4 ft. and standing 6 ft. above beach level, at a cost of £1 per lineal foot of groyne.

A shelter was erected in 1911 by direct labour—floor space 54 ft. by 10 ft.; back wall, partition, and end walls, and floor 6 in. thick, reinforced with ⅜-in. round indented bars. Total cost, including seats, retaining wall in front (not reinforced), and seats in front, £140.

Owing to the great rainstorm of August 25 and 26, 1912, which caused so much damage in Norfolk, and in which Sheringham had 5½ in. of rain, the lower portion of cliffs at the west promenade were washed on to the beach. Instead of filling up again with soil, the author recommended the construction of a raised promenade and shelter. This work was carried out by a contractor, and sections are given in Figs. 3 and 4. The elevation and size of shelter are similar to the previous one, and the whole of the work is prevented

the Government ought to pay for protecting the coast, or at least advance the money, as repayment of interest on loans is more than the repayment of principal. It is argued that the value of land saved is not worth the cost, but land once lost cannot be regained, and it is of national importance that Great Britain should not be allowed to become smaller. Many small places could afford to repay part or the whole of the principal, but cannot afford the added burden of interest, and work for protection only need not be on such a large or elaborate scale as is usual in seaside resorts. At any rate the Government ought to bear some of the cost.

General and Conclusion.

The whole of the works enumerated have been carried out by the author between the years 1907-14. Since 1914 the staff has been reduced and the town is just kept clean. Street watering has not been discontinued, as the council think that it is not advisable to sacrifice the health of the district for the sake of saving a penny rate.

Institution of Municipal and County Engineers.

EASTERN SUB-DISTRICT MEETING AT SHERINGHAM.

A meeting of the Eastern Sub-District of the Institution of Municipal and County Engineers, which comprises the counties of Norfolk Suffolk and Cambridgeshire, was held on Saturday last at the Council Offices, Sheringham. Mr. Arthur E. Collins (Norwich) was in the chair, and others present were: Messrs. F. Hall Smith (Sheringham), L. Keyworth Kerridge (Swaffham), R. Croome (Cromer), F. L. Burch (Dereham), W. A. Lavender (Swaffham), Chas. L. Hamby (Beccles), Henry Miller (East Suffolk), L. Leeper (Great Yarmouth), H. Read (Harwich), and J. R. Mead (Ipswich), hon. secretary of the sub-district.

Mr. H. R. Johnson, chairman of the Sheringham Urban District Council, extended to the members a hearty welcome to the town. Their profession, he said, played a very important part in the local government of the country, and as time went on it was destined to play an even more important part, when such questions as town planning and housing accommodation came to be dealt with more fully. One of the greatest problems Sheringham had had to face had been that of protection from sea encroachment—when he became a member of that council twelve years ago they regarded it as the bugbear of their lives. They were faced with a very serious position indeed, but by the hard work and devotion of capable men of their profession they had got over that difficulty to-day. In former days they lost on this part of the coast an average of about a yard a year through the encroachment of the sea. There was still room for improvement at the east end of the town, but so far as the major portion of the front was concerned, he thought they had got over their difficulty. Mr. Johnson proceeded to refer to the natural attractions that Sheringham had to offer, and particularly the beauty of the inland wooded scenery in the immediate vicinity.

Mr. Collins, on behalf of those present, returned thanks for so hearty a welcome, and said they were very pleased to have an opportunity to come to Sheringham for a meeting. A growing and "live" place such as Sheringham was the type of town where they could get very valuable experience, and that was the reason why they came. He had known Sheringham slightly for twenty-two years, and the development which it had made in that period was extraordinary. It spoke volumes for the enterprise of Sheringham people.

The business of the meeting was then commenced and the chairman at the outset made an appeal on behalf of the Orphan Fund, for which he said funds were badly needed.

Mr. F. Hall Smith, the surveyor to the urban district council, presented a paper on "Nine Years' Work at Sheringham"—reproduced elsewhere in this issue.

SEA DEFENCE.

The hon. secretary said some interesting letters commenting on the paper had been received from members who were unable to be present.

Mr. H. Clegg (Felixstowe) wrote: The question of sea defence is one of paramount importance to dwellers on the East Coast. The vagaries of the North Sea cause, perhaps, more erosion on the East Coast than on any other coast of Great Britain. I am of opinion, formed after several years of experience, that sea defence work cannot be generalised. A system which is admirable in every respect as a protection to a given length of coast line may, if applied to another length of coast line, be its undoing. Therefore, anyone with a universal panacea by whomsoever employed should, to my mind, be avoided, excepting perhaps as a consultant. A brief consideration will, I hope, bear out what I say. Sea defence works must be designed according to the geographical, geological and maritime conditions. Erosion invariably takes place at high water. When a north-westerly wind is prevalent over Great Britain it drives an abnormal amount of water from the Atlantic into the North Sea, round the north coast of Scotland. This condition, prevailing simultaneously with spring tides, has often disastrous results, especially if the north-westerly wind has a tendency to veer. Fortunately, the sea is never very rough during prevalent north westerly winds. A glance at the map will show that the elongated sand banks parallel to the mainland form a sort of double outlet to the English Channel, and to coast lines lying approximately north-east this condition is an additional adversity. The geological formation of the coast must have a great bearing upon the extent of erosion during high tides; an indurated formation is obviously better able to resist the attacks of the sea than alluvial formations of comparatively recent geological age. When the sea is shallow for a considerable distance from the coast, the erosion of foreshore or destruction of coast defence works is not so disastrous as when there is deep water contiguous to the coast. Deep water is necessary to float large waves, which obviously are more destructive than the smaller waves of the shallows. There are many other considerations, but the foregoing are perhaps sufficient to show that local knowledge is essential to successful sea defence work. Indeed it is, I consider, impossible for an engineer to hope for success without an intimate knowledge of local conditions. The bringing in of a stranger to construct defences on stereotyped lines is as futile as it is absurd. A consideration touching nationalisation, perhaps, should not be overlooked, and that is that seaside places which have spent large sums of money on their sea defence work should not at any time be called upon to pay for work in districts where no protective measures have been attempted; also it would be highly inequitable to utilise money from poor agricultural districts to help comparatively wealthy seaside resorts in their expenditure on defence schemes. It seems to me that every portion of coast worth protecting must work out its own salvation, and Government grants to localities requiring assistance would, I think, be a better and cheaper solution than nationalisation.

Mr. J. S. Hurst (Southwold) wrote: I am quite in agreement with Mr. Hall Smith's views that the Government should pay some proportion of the cost of the necessary work. There is no question but what the construction of defence works is a matter of national concern. This erosion is far more serious than many imagine. Take the Holderness coast of Yorkshire—from Flamborough Head to the Humber—then take the coast in the vicinity of Southwold; the erosion at both these places averages about 11 ft. per annum, which means one and a third acre per annum per mile of coast. This erosion of course does not take place where protection works have been carried out in the front of the different towns, but along the unprotected coast line, and where this occurs nothing is done, as the owners cannot afford to protect land when the cost is more than the land is worth, and this is where a helping hand is needed. Southwold, like Sheringham, has had to pay for its safety. £23,500 has been sunk up to the present (considerably more than the rateable value of the town) in fighting the sea, this amount not including any elaborate promenades, but being simply for necessary works. The corporation have the consolation, however, of knowing that up to the present the fight has been waged successfully. Surely, in face of these facts and the courageous way in which the smaller towns have struggled, it is not asking too much when one mentions the words "Government grant in aid." Some few years ago a Commission on this subject was appointed, the coast inspected and full particulars obtained of the erosion in different parts of the country, but nothing has been done. With regard to the construction of groynes, my experience teaches me that the best type of groyne for this part of the coast is long, low, timber-planked or sheeted groyne extending well below low-water mark. I have found these to answer much better, both here and on the Yorkshire coast, than high groynes.

Mr. Hamby pleaded for more unity in sea defence schemes between one council and another. At Sheringham, for instance if they put out a system of groynes for their own protection they caused the scouring of the coast to the eastward. It was the same at Lowestoft; protection works there caused damage at Pakefield, and heavy burdens placed on a rural district council that could not afford to bear it.

Mr. Leeper pointed out that a great deal of land was reclaimed yearly from the sea more, in fact, than was lost by it.

The Chairman. What is the value of such land? Except to such places as Yarmouth it is practically worthless.

Mr. Croome said that coast erosion was a serious matter for this part of the coast. Recently he had the opportunity of comparing an old map of Cromer, dated 1747, with the Ordnance Survey of 1885, and he found that during this interval of 138 years the land lost on the west boundary was 160 yards and on the east boundary 107 yards. This erosion had stopped during recent years, except at the boundaries, the front of the town having practically lost nothing. They were now suffering most on the eastern side. Cromer had now excellent shore protection, but it required extension to the east. Cromer had put in large groynes and good walls; he considered these groynes were far too light. The difficulties of the present position of shore protection were that small authorities had no obligation to protect, no means and no power. Work in one district under present conditions might cause considerable injury to an adjoining district. If the Government granted loans on the lines of those granted by the Road Board, great help would be afforded; but in face of the fact that it had cost Belgium £2,000,000 to protect only some fifty miles of coastline, it was useless to expect our Government to take over the cost of protection of our extensive coastline.

On the motion of Mr. Croome, hearty thanks were accorded Mr. Hall Smith for his paper and hospitality. A similar compliment was paid the chairman and the hon. secretary.

During the day the members had lunch at the Sheringham Hotel, and were entertained to tea by Mr. Hall Smith.

ANNUAL GENERAL MEETING AT BLACKPOOL.—(*Conclusion.*)

With this instalment of our account of the recent annual meeting of the Institution of Municipal and County Engineers at Blackpool we conclude the report of the discussions of papers. As will be remembered, time did not permit of the consideration of the whole of the papers prepared in connection with the gathering, and these will be reproduced as opportunity offers. In moving discussion on the paper entitled

THE DESTRUCTION OF A MACADAM ROAD,

by Mr. T. W. Arnall, Assoc.M.Inst.C.E., of the city engineer and surveyor's office, Birmingham, the president (Mr. J. S. Brodie) described the contribution as one of the finest on road construction it had ever been his lot to read.

The paper in question was reproduced in The Surveyor of last week.

Mr. C. H. Cooper (Wimbledon) said he did not think they had ever had a better paper on this subject, although he might be allowed to differ from the author on several points. As regarded waterbound macadam, Mr. Arnall seemed to advocate it and at the same time to point out the absurdity of attempting it. Where they had got stones of different sizes it was utterly impossible to get those stones into position so as to have all the voids filled up. The only thing they could do was to get the various sized stones as they were required to build up a road foundation. Large stones might be very well in the bottom, but he had noticed for many years the tendency of large stones to get to the surface. There was one thing stated which he could not accept—that large stones got their corners knocked off at the bottom of a road. He agreed that where they got wave action that might take place. He had had some trouble with a tar-macadam road, and in that case he was getting some trial holes open, and they found the ordinary London stock brick, 10 in. under the surface, and the corners had not been knocked off. Now, that was a very soft material when compared with the stone used in London, and they would think the traffic would be very capable of knocking off those corners. As regarded what Mr. Arnall said as to the effect of wet on the roads, there could be no doubt about its ill effect on the road. They had only to go along a road on an autumn day. If the day was not too wet or too dry they could see the places where the bicycles went. It would be all right if they could get a certain amount of moisture in the road. He had a waterbound macadam road which had stood 'bus traffic perfectly. They laid a road down in spring or autumn, when the weather was often very wet. The coarse material was taken away for about 4 in. to put down a tar-macadam top, and below that was the ordinary gravel, which contained a good deal of binding material and a good deal of clay. It stood perfectly well as a road before, but the wet had got into it, and it was extraordinary how it held up the wet. The great destroyer of the roads now was wet. He had been rather surprised that in the paper the author had not alluded to wave action, because that was an absolutely destructive force to the roads. A road might be able to carry the weight which was brought on it just as a bridge was able to carry the weight brought on it. But so soon as they had wave action there was no doubt that was the great destructive force. If a road was to carry traffic economically, they must treat it in exactly the same way as they treated the bearings in the case of machinery they must keep it as smooth as possible. They had great advantages in keeping the road smooth, one was that they were able to maintain it more economically, and, further, it was able to carry more traffic. The idea of allowing roads to get into their present state was the most ridiculous thing possible, because it was like throwing hundreds of thousands of pounds away, and economising in a few thousands of pounds, the spending of which would produce great economy in the use of the roads.

Mr. A. E. Collins (Norwich) referred to the question of the sizes of wheels, and the way the effect of the allowable weight varied with diameter. He quite agreed that the rules of the Board of Trade were reasonable as to weights with vehicles of moderate sized wheels; but when they came to wheels of considerable diameter he did not think the rule should hold good. They all knew that with the use of vehicles with wide tyres those tyres would not bear weight equally over their whole width. What was wanted was some means of equalising the pressure through the whole width of wide wheels. He knew it was a complicated question. He had been trying to work out a machine for doing it. Unfortunately, the makers of vehicles did not want to do it, because they wanted to sell their vehicles; but engineers wanted users to allow their roads to have a chance, and they did not stand a chance if too wide widths of wheels came on the roads.

Mr. O. E. Winter (Hampstead) said in this paper they had stated afresh in a way that only a scientific mind could the old-fashioned objections to macadam roads. The paper should be a knock-out blow to the old-fashioned macadam road. They were utterly sick of it. The less they had to do with water-bound macadam roads the better it would be for their councils and for those who used the roads. There was no doubt that water was insufficient to bind roads. With the motor-omnibus traffic, the water-bound macadam road was utterly out of the question. They were trying to do their best with tarred surfaces and with bituminous materials to get a nice even surface. His recent experiments during the last two or three years with a bituminous carpet on an adequate foundation was one of the best ways of sustaining the traffic, and at the same time the most economical. That had been their experience in Hampstead. His road costs were going down, because for the last seven or eight years he had adopted a bituminous construction.

Mr. W. Harpur (Cardiff) remarked that Mr. Cooper had mentioned that Mr. Arnall did not refer to the effect of wave movement in the road surface. As he read the paper, he thought Mr. Arnall did most clearly refer to it. He said: "That there is such a sideways tendency to escape is well seen in a pulpy road; the rut formed by a heavy-loaded wheel is plainly due to a lifting at the sides as well as to a sinking under the wheel. Often it may be seen in front of a roller at work on a thick coating; the mass rises as a flat wave in front to be forced down again as the roller moves over it. In any case there is no salvation, whether the view of one big crack is taken or a multitude of small ones; whichever view is taken the destruction of the material goes on just the same." He was afraid Mr. Cooper had not read the paper very carefully.

Mr. H. E. Stilgoe (Birmingham) remarked when he approached Mr. Arnall the latter said he would prefer to write upon the destruction of roads rather

than the construction of roads. He thought it was greatly to their benefit that Mr. Arnall had done so, because he had put the case so very clearly before them that the information given was of the very greatest value. He could not understand anyone considering for a moment that the internal wear upon a road was a small matter. He happened the other day to read an original contribution, which was written in 1821, by the late Mr. Loudon M'Adam, and he began that report upon the old roads of London with the statement that the gravel of which so many London roads were made at that time was unsuitable on account of its roundness. If there was, he said, no interstitial wear, or internal wear, there would be no objection to using the round stone in the course immediately below the wearing surface. They all knew that those roads which had for the upper part of their foundation, immediately below the wearing surface, material composed of rounded stones, were always in trouble. Those stones were really never at rest, because of the influence exerted by the pressure transmitted through the wheel to the internal portion of the road. As Mr. Arnall very ably illustrated it by the cone, one expected naturally that that disturbing influence was decreased according to depth. Mr. Cooper had mentioned an instance in the road he opened of a London stock brick 10 in. below the surface with the edges practically as they were when put into the road. That might very well be; there might be reasons for that, and it was a very fair depth below the surface. But they knew in opening the road for repairs, for trenches, and for making renewals, they did find this very great internal wear upon the stone. They must have some other means of binding the stone, and holding it firmly in its grip to keep it up to its work. With a granite sett they held that up firmly to its work as a tool was held firm to a grindstone. If they put a tool to a grindstone with a wobbly hand they got no result, and he thought this applied to roads. These points were not always appreciated. Mr. Arnall had mentioned another important matter, the great quantity of clay in road surfaces, with many stones employed in road making. He knew stone which, wash it as they please, and break it with a hammer, they found clay on the surface; crush it and test it in the tube and they found clay. That would take days to settle, according to the quantity. The heavier parts, the dust and the fine chippings sank to the bottom. He believed clay had a great deal of influence upon this subject. These matters were entirely put upon one side when they took into consideration bituminous bindings. The effect of wetness, which Mr. Arnall had referred to, also pointed in the direction of the greatest care being taken in keeping the surface of the roads solid. The wetness which was observed at potholes would show them that destruction took place there more than at any other part. If they could only keep their surfaces solid and intact they would have arrived at what they were striving for, and he thought the only way to do that was by using a binder of a bituminous nature in the construction of the roads.

Mr. Matthew Jones (Chester), speaking as to remedies, said as they were aware he had constructed some reinforced concrete roads. He had brought the reinforced concrete up to the surface for the traffic to travel over, and he was quite convinced that every road must be bound with some material that was going to keep the granite in its position. He had to keep his roads closed for three weeks or a month, according to the weather conditions, to allow the road to set thoroughly. That was the great drawback at the present time, but there was no doubt that concrete roads would come into use in this country. They stood the wear of traffic very much better than tar-macadam roads. The whole thing was put together as one mass, and so far as he could see there was not the slightest movement whatever. In a tar-macadam road they still got movement, because they had got weather conditions, rain and snow, to contend with. A concrete road became impervious if they allowed it to set properly. If they once got a concrete road set they might take it from him that they had got an excellent road. If they tar-sprayed the surface and spread with granite chippings after it was set, they went still further to make it impervious to weather. There were no potholes in the road which he constructed four years ago. There was no brushing, or very little, required, because when the rain came down it washed the road clean. He had been asked by several members with regard to women's labour at Chester, which was mentioned in the Presidential address, and he would like to say one or two words on that. At Chester they employed women labour in various departments, and on various kinds of work. He had got women doing tar-spraying, and they were doing it exceedingly well, equally well as some of the men he had working on the same class of work. They brushed the roads, they actually did the tar-spraying, and spread the chippings. The only man he had on the job was the man who looked after the tar boilers and the boiling of the tar. He had not been able to get the women into the way of boiling the tar to the right consistency. They had women working on the sweeping of the streets, and they did it exceedingly well. A friend of his spoke to a woman who was brushing the road, and she brushed the sweepings right on to the top of a gully. This was what they had to contend with. His friend said to her: "You should brush round that grid," and she replied: "It is less work, because it goes down." Unfortunately, many of his gullies had been stopped. The surveyor must not expect the same work from a woman as from a man, as they had not got the strength to do it. He was rather surprised to read the other day that the women brushed too heavily and brushed up the macadam. He wrote to a friend and said they brushed the streets as if they were carpets and not macadam, and not hard enough to his liking. He was sure woman labour had come to stay in this country; he had not anything like the trouble with women as with men. They had also women engaged in the collection and stacking of paper, and they were making a very good profit. He tried women on the refuse tip, but he was not able to say he had succeeded there. It was rather dirty work, and not very nice. He had women engaged in the parks cutting the grass with lawn mowers and planting flowers. He could assure them that, so far as Chester was concerned, woman labour had been the salvation of keeping their roads going in very good condition.

Alderman Bainbridge (Stockton-on-Tees) said they had three streets running east and west and three running north and south. They were made of tar-macadam. The streets running east and west had been trenched down and filled in for a depth of 15 or 16 in. with good slag and clinker, properly rolled in, and 5 in. of tarmac on the top. The roads running east and west they had trouble with. The roads running north and south were like the roads in Blackpool—good roads. Their experience had been that the foundation which had been laid under those roads running east and west had been too rigid, and if they got too rigid a foundation they got more pounding upon the tarmac. The traffic seemed to push the tarmac out of place, and they got depressions in the road.

Mr. H. T. Wakelam (Middlesex) said it was not his object to make any remarks upon the paper, but he rose to ask Mr. Matthew Jones for some particulars as to concrete construction. He wanted to know the tonnage per day on these concrete roads; particulars of the aggregate of the concrete and particulars of the other materials.

A Member also asked the number and weight of the mechanically-propelled loads on these roads.

Mr. Matthew Jones replied that the weight of the traffic over these roads was anything from 80 to 120 tons per day.

A Member: What is the width of the road?

Mr. Matthew Jones: The width of the carriageway is 20 ft. The largest weight which had gone over the road at one time was 15 tons.

Mr. Wakelam: A traction load?

Mr. Jones: A traction load on four wheels. Then with regard to another concrete-made road, the Whitefriars-road, he could not say what the weight of the traffic was. It was lighter, but more constant. There would be anything up to 500 vehicles a day passing over it.

Mr. Wakelam: One-horsed vehicles?

Mr. Jones: Yes. The aggregate was mixed five to one. The stone was graded ¾ in. to 1½ in., and that was mixed together.

The President: What kind of stone?

Mr. Jones: Granite. The Whitefriars-road was done with granite from Penmaenmawr.

Mr. S. S. Platt (Rochdale): Was the concrete reinforced? And what is its thickness?

Mr. Jones: 6 in.

Mr. Platt: What sort of reinforcement?

The Surveyor

And Municipal and County Engineer.

Mr. Jones British reinforcement. The road has a clay bottom.

Mr. Wakelam: What was the cost?

Mr. Jones replied that the cost of the road worked out very cheap. The railway siding was only 300 yds. away from the tip, therefore the carting was very much cheaper. The cost of the cement and stone all had to be taken into consideration. This particular road, he believed, cost 3s. 10d. per yard.

A Member: Is that the Whitefriars-road?

Mr. Jones: No, the Whitefriars-road cost more than that. The Whitefriars-road cost 4s. 8d. per yard, owing to the longer distance of carting and the increase in the price of material.

The President: What is the average price to maintain over a period of four or five years?

Mr. Jones replied that he had never had to touch the road in four years, but once per tar-spraying, and the road was as good to-day as when laid down.

Mr. H. G. F. Gillan (Belfast) said he quite agreed with Mr. Sturge that it was the holding up of the surface of a road to the work that was the main factor in resisting destruction, and the whole question was the best method of doing that. Mr. Stilgoe had dealt with stone in block. In the form of a setted paving it would probably last ten times as long as a stone which was broken and put down in the smaller shapes of ordinary macadam. Then they found the intervening method of closing their voids and sealing with a bituminous binder something like five times the life of ordinary water-bound macadam. That was because the stone was bed to the work. He would like to mention another point which had come to his notice this year. He dared say that other places like Belfast had been restricting street watering. The men had told him that the wear of the roads had been greatly lengthened by not doing any street watering. That was significant. They wanted a binder that would resist street watering. It was a point worth knowing, and people would have an opportunity of considering it. He wanted to add one other question with regard to Mr. Jones's remark, and that was as to the repair of concrete surfaces. The great difficulty with concrete was to bind concrete with concrete. If they found the surface wearing off with a fine lamination they had got to reinstate that. How were they going to do it? That was a point he should like to know something about.

Alderman Harwood (Worcestershire) said he had been a good deal interested in noticing an omission from Mr. Arnall's paper, and also from the speeches of those who had spoken on it. That was the effect of the expulsion of a jet of water from a pothole. He had always imagined, and his observation had confirmed the view, that it had a very destructive effect on the road. The small detritus must be forced out and the pothole increased in size from that action. He thought that was borne out by observing the potholes during a period of fine weather, and then, a month later, after a period of wet weather. Mr. Arnall, in developing his argument on interstitial wear, said the destruction of a macadam road was not a question of wear on the surface. A wheel might pass by and leave no track behind. He admitted a wheel might pass by in fine weather and not leave a track, but he had never found a wheel bearing in wet weather which had not left one. And he thought where that track was, in nearly every case, the edge of the stone had been broken down.

Mr. H. T. Chapman (Kent) said that on the London-Dover road they had a traffic of 1,000 tons per twenty-four hours, varying from traction engines to bicycles. A section of this road they laid with concrete 6 in. in thickness, some portion reinforced, the other portion with plain concrete. Unfortunately they could not close the road during the carrying on of the work. Consequently 1,000 tons of traffic a day was concentrated on 10 ft. of road, while the other portion of the road was made; as a result the heavy traffic caused serious damage to the concrete. After consultation with the Road Board it was decided to carry out the work with 3 to 1 in sections with different kinds of concrete. The section laid with 3 to 1 concrete was as good as when laid, but the 6 to 1 concrete, graded from ¾ in. to 1½ in., was not a success. He did not know the reason why the more rough graded concrete would not stand the compression of exceedingly heavy traffic. It might be that tar-spraying would do something for it, but if Mr. Jones would experiment with a road on which there was some traffic it would not be so successful as in Chester. If a contractor came to him and promised to lay a road he found him the worst possible conditions for experiments. He thought before they laid a material at such an expense per super. yard they should test the material under the most trying conditions. He liked to hear of failures—they were more interesting to him than successes.

Mr. J. Paton (Plymouth) said he thought it would be unreasonable to ask local authorities to make roads in such a way as to stand any kind of traffic. Surely road users had some kind of responsibilities in the kind of tyre used upon their vehicles, and the Legislature should deal with them. He had had forced upon him in Plymouth on the roads the conveyance of coal from the docks to the gasworks. They were using steam lorries for the carrying of the coal. The road was constructed of granite setts on 6 in. of foundation to begin with. The road gave way very soon, and they found the foundation was crushed. They reconstructed that road and put in iron bars and repaved with Penmaenmawr setts. What happened then, with a perfectly rigid foundation, was that a grinding action was going on and the setts were being worn away. He thought it was unreasonable to throw upon the local authority the responsibility of keeping that road in good condition. There ought to be some limit to the load that should come on the road, and some restriction on the kind of tyre used on the wheels.

Mr. Arnall said he was very pleased indeed at the kindly way in which they had received the paper. Mr. Cooper referred to the upward forces as being destructive. Perhaps he should not say that he wilfully left that out, but he did so. It seemed inconsistent with the assumption that they were only dealing with the top surface, and assumed there was a good solid foundation beneath it. If he had taken into effect these upward forces they would have vitiated the underlying assumption and led to a lot of indefinite expressions. He thought it better to confine it to one basis, and thereby leave it much easier to discuss. That was his only reason for leaving that out. He quite agreed with Mr. Collins that the size of wheels and the width of tyres had an effect. But the Board of Trade by-laws had to be of a cast-iron nature, and when they got the wheels beyond a certain width they began to lose the good effect of the width; he would not say they began to lose the effect—they did not get it at all, as they did not have a level surface to travel over. They would not get the effect of the width unless the road was a dead level. If they had a soft tyre they got the weight distributed over a larger surface, but with a rigid tyre they did not. That was one of the sins of the road roller. When they began to roll it might not go on a quarter of the width, so they got the projecting portion of the surface crushed to the general level. If there was a good camber on the road instead of the tyre acting as a roller, they might have the roller acting as a destructive effect and breaking up the road. These remarks about even surfaces met

the remarks of Mr. Winter. An even surface was of very great importance: it stopped the concentration of the load which they must have upon the projecting parts of an uneven surface. They could not have the weight of a portion with the cone he had described, that cone having a tendency to break away from the macadam round it which did not carry the load. That was the principal reason why they got so much interstitial wear. He agreed that potholes were due to the horses' hoofs upon an imperfectly rolled surface. They disturbed the surface; they only got it restored, and that left a weak place in the road. That was the cause of the pothole in the road. When it was once formed a pothole went on in increasing formation. Whatever caused unevenness in the surface must cause local weakness and resulting potholes. The peculiar thing about potholes was that one pothole insured the formation of another, until they got a row of these potholes all having their origin in one place. He agreed with Mr. Stilgoe that a thing of great importance was to keep the surface solid. If they kept the surface solid the water ran off before it got in. They could not get it perfectly solid. If they could get enough moisture in to keep it damp, and yet not allow the wet to get in to the road, it would be better than a dry road. They had one piece of concrete road in Birmingham which had been down about twelve or fifteen years. It had been repaired, and was still in very good order. But it was on a dead level surface, and there was not very much traffic on it. The trouble was that when the surface did begin to wear out they could not repair it with effect. With respect to Alderman Bainbridge's remarks, he should like to get some more knowledge of those roads running east and west and these running north and south. He maintained there was a considerable difference in the wear and not the construction. Mr. Gullan referred to the importance of holding the stone to the work. It was a long time ago when he made a comparison between the wear of the actual amount of stone used on a macadam road as compared with the amount of stone used on a granite-paved road. They had granite-paved roads in Birmingham where the granite had been down for fifty years. They were 6-in. setts, and he did not suppose they had worn ½ in. He supposed if it had been put on in the form of broken stone they would have had to put 3 in. or 4 in. on every year and cart it away in the form of mud. They would have had to put 10 ft. of stone on the road in that time in little pits, and scrape it off as mud. It was enormous the difference between the wear of setts and broken stone. The remark of Mr. Gullan about the beneficial effect of not watering the roads was a very useful one, and ought to have a useful application. He only hoped it could be confirmed. With reference to Mr. Harwood's remarks, he had evidence upon surface wear, but he was not going into that, and wanted to point out that it was unimportant as to what was going on down below. He was not quite able to follow Mr. Chapman's remarks on the London-Dover road, but he understood him to say that the rough concrete would not stand where the finer concrete did. He did not know why that should be. His notion of a concrete body was that it should be perfectly solid, and it should not make much difference whether the stone was large or small so long as the other things were equal. It might be that the larger stone when it began to wear would show isolated points, and the stone would give way. If they crushed the stone which formed part of the solid mass they made a pothole there, and the trouble would extend. That was the difference probably between the rough and the smooth surface. Mr. Paton made remarks about the steam lorries destroying the setts. He gathered that was due to the foundation giving way. They had during the last three or four years the destructive agency by which setts were being crushed, and those setts would not be crushed if the foundation were not as good as it was. It was like putting the sett upon an anvil and giving it a blow with a 10-ton hammer. They had got a good many granite setts crushed in that way. The only thing they could do was to repair the road. They got none of that effect with rubber tyres. That pointed to the fact that rubber tyres were the proper thing, and they ought to do as much as they could to extend their use provided they could have a road surface to suit them.

Sir William White Memorial. £3,000, collected for a memorial to the late Sir William White, will be devoted to a research scholarship fund, a medallion portrait in the Hall of the Institution of Civil Engineers, and a grant to Westminster Hospital.

ACTION AGAINST AN IRISH COUNTY SURVEYOR.

At the Londonderry Assizes, on Friday last, Mr. Justice Gibson and a special jury heard an action brought by three farmers and road contractors—Michael M'Guckin, Derrychrin, Eglish, County Tyrone; James M'Guckin, and John M'Guckin, of Ardagh, County Londonderry, all brothers—against Charles L. Boddie, county surveyor of Londonderry, to recover £500 damages for alleged libel. Defendant pleaded privilege.

The alleged libel was contained in a report made by the defendant to the Magherafelt Rural District Council concerning a road for which the plaintiffs' father had been contractor. After the father's death the plaintiffs continued the work on the road. The report was as follows:—

"I have to report a serious case of fraud in connection with the materials on first-class road No. 26, from Ballyronan to Coagh. The materials were measured by Mr. M'Farlane on September 6th last, and the road contractor was credited with the value of the materials then measured. Since that date there have been stolen from the road 55¼ cub. yds. of metal and 11¼ cub. yds. of stone screenings, the total value being £33 5s. It is impossible to believe that the representatives of the contractor, who, it is said, died recently, were not privy to this act, and therefore I must hold these representatives responsible for the loss of materials and breach of contract. Under the circumstances I don't see my way to certify for any further payment in respect of this contract. Further, the county council may consider it necessary to prosecute the persons concerned. I have pleasure in stating that it is due to the care and vigilance of Mr. M'Farlane that the theft was discovered, and he was ably assisted by Mr. M'Nulty in measuring the materials and checking quantities."

The plaintiffs were examined, and stated that the stones could not have been removed without their knowledge, and no stones had been taken away after the date they had been measured and certified.

Mr. Brennan and Mr. Tipping, surveyors, proved that there was no shortage in the metal which they measured.

Mr. Elliott, chairman, Magherafelt Rural District Council, and Mr. William Hastings, clerk of the council, were also examined.

Mr. Babington (for the defendant) asked his lordship for a direction on the ground of privilege, and that there was no evidence of malice.

His lordship said the occasion was highly privileged. There was not a particle of evidence of malice. It would be a hard thing if these respectable young men should be aspersed in this way if there was no real shortage.

Mr. Babington said his client was quite willing to withdraw any imputation contained in the report.

His lordship directed the jury to find for the defendant, the latter disclaiming any imputation on the honesty of the plaintiffs. His lordship also expressed the opinion that the county council should absolve the plaintiffs from costs and indemnify the county surveyor.

Concrete Drinking Troughs.—Many estate agents and estate clerks of works employ their bricklayers and labourers during slack times in making concrete articles for the farmers on the estate. Drinking troughs for cattle, which were formerly made of wood, are now made with Pudloed cement on the Earl of Dudley's estate. The troughs are 10 ft. by 2 ft. by 18 in. deep, 2½ in. thick at the bottom, diminishing to 1¾ in. at the top of the sides. These troughs are indestructible, and we understand give great satisfaction to the farmers.

Building Regulations.—An inquiry during the week at the Ministry of Munitions regarding the new Order in Council regulating building elicited the information that work which was in progress before July 20th need not be stopped pending the granting of a licence. Any building commenced before that date should be continued until such time as a licence should be definitely refused. There is no desire to restrict building unless a national purpose can be served. The principal purpose of the Ministry is to limit the use of structural steel, a further purpose being to assist the Ministry of Munitions in obtaining such building labour as is urgently required upon munition factories.

Motor Vehicles for Municipal Work.

DISCUSSIONS AT CLEANSING SUPERINTENDENTS' CONFERENCE.

(Conclusion.)

On the presentation, at the recent conference of the Institute of Cleansing Superintendents of papers* by Messrs. W. Greig, Glasgow, and James Bee, Blackpool, dealing respectively with the subject of street cleansing by motors, and street watering with electric vehicles.

Alderman Hornby (Manchester) proposed the customary votes of thanks. In his opinion motive power for street watering and street cleansing was absolutely necessary. In Manchester they had been somewhat backward in this respect, but he hoped the corporation would benefit from the excellent papers read that day.

Mr. L. S. Mackenzie (city engineer of Bristol) seconded. He said the papers were eminently practical and contained a good deal of useful information. At Bristol they were keeping their eyes open. They had not introduced any electric traction yet. He saw the watering machine at Blackpool a few weeks ago, and he was very pleased with the work done by it. As far as road-sweeping was concerned, they had had two Lathy machines in Bristol since last October, and were more than satisfied with the results obtained. He had not got any figures, but he agreed with Mr. Greig that it was no good taking any notice of remarks about doing away with seven, eight, or nine horses with this machine. He kept the cost for three months as compared with three months in the previous year, and there was not the slightest doubt they were effecting a saving of £150 per annum on each machine. The only thing they found with these machines was that they did more sweeping than before they got over the ground so quickly. They were able to get the busy part of the city cleared by nine o'clock.

Councillor Holden (Manchester) asked Mr. Bee by what means he was able to save £50 on the water.

Councillor Blackburn (Leeds) said he could say ditto to almost all Mr. Greig had said. Mr. Greig had said that in Glasgow as nearly as possible they were overtaking the work of three horses. In Leeds one of their

MOTOR SWEEPERS

was taking over the work of three horses. He thought the motor sweeper had a great future in store for it. The difficulty they had at Leeds at the present time in all departments was the shortage of labour. When the war was over, and the difficulty was removed, he thought that in most of the large municipalities there would be a very large fleet of motor sweepers, because they did the work most expeditiously, and working as they did mostly in the night, they could cleanse the town and have it in perfect order for the early morning.

Mr. H. F. Wigfield (Leicester), Bailie Coughtrie (Motherwell), and Mr. R. H. Stoker (Tynemouth) asked for further information on points in the papers.

Councillor Dr. Greenhalgh (Bury) said that some of the large railway companies had taken up electric motors for cartage work, and this in itself was sufficient to cause local authorities to watch developments in this class of traction.

Mr. J. Priestley (Sheffield) said the conference had demonstrated that they had some very good readers of papers. He wished Mr. Greig to clear up one or two points. The first was whether the sweeping of the streets in Glasgow was carried on during the day or night, or both. If it was carried out both day and night, did we use the motor sweepers on both shifts? and if not, why not? because if the machine would do the work of rather more than three horses on one shift it would do the work of double the number on two shifts. Mr. Greig had also dwelt on the

MOBILITY OF THE HORSE

and used the argument that a horse was more valuable in one respect than a motor, in short, it could be transferred from one class of work to another, and he instanced the transference of the horse from the removal of house refuse to the clearing of snow. He wished to know if Mr. Greig had had experience as to the efficiency or desirability of using motor sweepers during the early parts of a snowstorm in perambulating the streets and preventing the accumulation of snow. He believed that in some districts that plan had been used with good results. Turning to Mr. Bee's paper, Mr. Priestley said it was stated that the vehicle, during the dinner hour, was given a boosting charge of about 1½ to 2 hours' duration. Did he mean that the vehicle was boosted for that period, or merely that it was charged at normal rates for 1½ to 2 hours? Mr. Bee also said that his figures were based on 1½ units per mile. Was that the result of actual experience, or merely an estimate? Mr. Priestley asked Mr. Bee for further information with regard to the saving of £95 7s. 2d. in two months in comparison with the previous year. Before the figures could be of any value they ought to know the climatic conditions for the two periods. Mr. Bee did not say, too, whether the mileage of the streets was identical in both cases. Mr. Bee had mentioned for depreciation on the batteries for a period of two months a sum of 8s. He (Mr. Priestley) wished to know what was the guarantee that accompanied the battery, because he understood the guarantee usually given with this class of battery was limited to two years' use. If 8s was the rate of depreciation for a period of two months, or £96 for the two years, that seemed not to be anything like sufficient, because it did not provide a sufficient sum for the renewal of the battery at the end of the guaranteed period. He also wished to know why Mr. Bee had made no allowance in his estimate of cost for the maintenance of the vehicle.

Councillor Stephens (Bristol) said he had come to the conclusion that horses could not be entirely replaced by mechanical power. Everything was against the horse to-day—the price and the cost of provender, which was almost double. In his opinion, when the war was over they would go back to the horse, which we always thought so much of in this country.

Councillor Broadbent (Oldham) said that Mr. Greig had not said anything about taking up the refuse after the sweeper had done its work. He would like Mr. Greig to tell them the difference in the picking up of the refuse by motor sweeper and by horse sweeper, and show a comparison as to how many men followed the machines.

Bailie R. Mitchell (Glasgow) said that Mr. Greig had been a strong advocate for the work of the horse, but he had been public-spirited enough to recognise that they must move with the times; and while the horse was a most valuable animal, they had to recognise that they had to make greater progress to-day, and to make more

USE OF MECHANICAL POWER

in the cleansing of their streets than they had in the past. He recognised that they had to take into account not the present cost of a horse and the price of provender, but the cost and the price before the war. Mr. Greig's paper was based on that calculation. They had given this question careful study in Glasgow, because they had had more experience of motor sweeping there than in any other town in the United Kingdom. They had at present a fleet of twelve motor sweepers. They had not confined their attention only to one company, but they had three different classes of motor sweepers. Mr. Greig did not say which was the best, but he might give the information privately. He congratulated Mr. Bee on living in a district where he had to water the streets forty-eight days in two months. In Glasgow they were fortunate if they were called upon to water the streets forty-eight hours in two months.

Councillor Tebitt (Southampton) said that, while he was in sympathy with any movement in favour of traction motors, he was not satisfied that the method of collecting refuse and street watering had been improved. Still they were working on the right line. It was suggested on the previous day that if they bought anything out of revenue there was no need to provide for interest. With that proposition he entirely disagreed.

* See The Surveyor, July 21st.

Mr. W. J. Steele (city engineer of Newcastle) said he agreed with the president that, whether they used horses or mechanical vehicles for their work was only part of the whole. The president had said that the question must be looked at in a broad light, and explained it by saying that the motors he used damaged the streets, and therefore it was a question whether any advantage they might save in scavenging was really a saving to the ratepayers on the whole. One of the best books of statistics he had seen was issued by the London County Council, and in an excellent preface the clerk to the council said that any

COMPARATIVE FIGURES

were of no avail unless based on the same standard. Personally, he was thankful to all gentlemen who had given figures, but he would not like to base a single conclusion on any one of the figures given. Unless, for instance, figures showed the whole of the cost of the alteration of a system they were of no value. He would suggest that the committee should base a standard of tables for statistics, so that in making comparisons the whole of the figures should be on one standard. He did not think it was altogether a question of cost, because they had to consider the economy of the nation as a whole. Supposing, by any additional cost, 2d. or 3d., or whatever it might mean in the £, upon any work the municipality might do, they saved so many lives per annum, or they decreased the rate of sickness, that was all to the good of the nation, and particularly after the war, so that the question of a mere little detail was of small moment.

Councillor Diggle (Rochdale) said it seemed to him that the Blackpool vehicle was an expensive machine. To have £1,000 in a machine hung up for at least half the year seemed to him to be extravagant. It did not seem to him that the experience of Blackpool was of much use to industrial towns.

Mr. T. H. Whitewick (Surbiton) said he had had two steam motors, one of which had been worked nine years and the other six years. They worked from eight to twelve hours a day, and he found them very satisfactory. They were used for watering, sweeping, flushing, hauling, and steam rolling for light work. He found the sweepers only lasted ten days with the motor against seventeen days with the horse, but they did a much greater mileage.

Mr. W. H. Hamblett (Salford) said it was possible for the water tank to be taken off the Blackpool machine and the machine turned into a refuse carrier during the winter months.

Alderman Brown (Blackpool) said that Mr. Bee had found work for the machine all the year round. The corporation had never bought anything which gave them greater satisfaction than the water sprinkler.

The President (Mr. W. Harpur) said he agreed with Mr. Steele's remarks that, in arriving at the cost of anything, everything, including interest, sinking fund, and establishment charges, should be included. They could not arrive at the proper cost of an article if these items were not added on. Mr. Steele also suggested there should be standards for arriving at the cost of these different articles. He was glad to tell Mr. Steele that a committee had been appointed by the institute to standardise a form in which these costs should be based and arrived at.

Mr. Greig, replying to the discussion, said they had no experience in Glasgow of working the machine on the double shift. He agreed with Mr. Priestley that if they had worked a night shift the results would have been better. As to the mobility of the horse, under certain conditions the machine could be used in a snowstorm, but when the snow was lying a depth of 6 in. the machine was of no use whatever. He agreed with Mr. Steele that the institute ought to have a standard of figures, otherwise comparisons were useless. Motor sweepers required less accommodation than horse-driven machines, and this should be borne in mind when making comparisons between the two classes of traction. As to the length of

LIFE OF BRUSHES,

he found in Glasgow the sweepers covered about 210 miles with one brush, the pressure on the road being more evenly distributed by the motor machine.

Mr. Bee, in his reply to the question as to how they saved £50 on water, said it had been their method before the war to spray with the hose pipe, but they were short of water and labour, and now did this work with the electric motor on the sweeping machine.

Alderman Brown, interposing, said that they formerly paid the engineer's department for the water. Now they did not. That was how they saved the £50.

Mr. Bee said the motor had displaced six horses, and when the second vehicle arrived it was their intention to dispose of all the horses employed on the work. The machine now in use was paid for out of revenue. The battery on it was guaranteed for two years, and he put depreciation down at £12. Mr. Bee added that the machine had been used for refuse collection in the winter.

The vote of thanks to the speakers was carried.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Why should the minds of some of the members of the Lewes Town Council have been exercised because some fencing was taken from the cemetery, presumably because it was not wanted, and erected at the sewage disposal works where it was needed? Why should it be "incongruous," as one member stated, to do this, and was it objected to because the fencing was taken from consecrated ground? Is not this going a little too far with sentiment?

* * * *

Apropos of consecrated ground, who was responsible for the following story? A council were experiencing some trouble in having consecrated a small portion of ground which they had added to the cemetery, and after listening for a short time to the discussion, one of the members rose and said: "Mr. Chairman, I don't see no difficulty about this; I had my back yard consecrated a month ago and now it is as dry as a bone."

* * * *

Was there not a good deal of truth in the statement made recently by the Deputy Minister of Highways at Ontario that "Nations have prospered without railways, but common roads, 'good roads,' have always been vital to national development and progress"? What will be the condition of this country if, owing to mistaken war economy, our roads are neglected and allowed to get into a state of disrepair?

* * * *

Do not the idealists in connection with town planning sometimes ask for such expensive schemes that they rather frighten local authorities, who are obliged to study the ratepayers' pockets? For example, is it not asking rather too much to say "that all roads should have the buildings 60 ft. apart, measured from opposite sides of the road, and that each building should be set back 10 ft. from the road"? Who is to pay for the land thus given up, and who is to pay for the upkeep and cleansing of roads of such dimensions? Are such widths really necessary in some roads?

* * * *

Would it not be interesting to know what salary is paid to the surveyor of Barkisland, Yorks, Urban District, who continues not only the work of surveyor to this district, but also that of waterworks manager and rate collector? What are the other duties of this official, who was recently granted exemption from military service until September 1st? Could there be any doubt that such a man was a real "indispensable"?

* * * *

Are there not a large number of problems which will have to be faced after the war, such as the restoration of our roads, housing the labouring classes, town planning, the completion of half-finished schemes, the reconstruction—on more modern lines—of sewage disposal works, better provision for the collection and disposal of house refuse, larger combined water supply schemes, and defences against sea encroachments? But how will these be paid for, in addition to the repayment of the huge national debt which is mounting by leaps and bounds every minute that the war lasts?

* * * *

Will not the late Mr. John Hutchinson, who did so much towards the improvement and simplifying of laboratory work in connection with bituminous road materials and tars, be greatly missed by road engineers? Was not his personality one that is not likely to be easily forgotten by his many personal as well as professional friends?

Surveyors: Their Security of Tenure and Defence.*

By J. H. DREW, M.Inst.C.E., Borough Surveyor of Grantham.

Although "security of tenure" has been referred to from time to time in presidential addresses to the Institution of Municipal and County Engineers, and in the reports of the "Proceedings" of the council, the author is not aware that a paper has previously been submitted for discussion at an annual meeting, and this must be his excuse, if one be needed, for asking the members to give the subject their serious thought and consideration in the interests and welfare of municipal surveyors as a body, and not merely from the point of view of individuals.

For some reason or other, our esteemed retiring president (Mr. Wakelam) made no reference in his presidential address in June last to the question of "security of tenure," although it is well known to many members that for years he has been working assiduously in the direction so frequently indicated by his predecessors. A few years ago Mr. Wakelam and Mr. W. H. Prescott endeavoured to formulate a mutual defence scheme, but their efforts came to nothing; since then the council of the institution has taken a ballot of the whole of the members, but only a very small percentage took the trouble to return their ballot papers; while still more recently an association registered as Official Security, Limited, has been founded, but only 1 per cent of the members of this institution have joined. Is it that members are absolutely indifferent, or do they want something for nothing?

OFFICIAL SECURITY, LIMITED.

This association—*i.e.*, Official Security, Limited—has been formed on co-operative lines by public officials to effect policies of insurance against loss or diminution of official salary, litigation risks, and larceny of money in transit, and its members comprise head officials in all branches of local government work. The articles, forms of policies and contracts were settled by eminent King's Counsel.

The scheme has been approved and adopted, after careful inquiry into its financial basis, by the Institution of Municipal and County Engineers, the Association of Rate Collectors and Assistant Overseers, and the London, Liverpool and Manchester Incometax Collectors' Association. The very low premium of 5s. per cent is charged for normal risks for security of tenure, with three years' salary as compensation. The litigation policy of 5s. per cent is specially valuable and attractive. For instance, one member was defended successfully in police court proceedings at a cost of £29 2s. 6d. (which he would otherwise have had to bear personally), in respect of an assault by one of his councillors. The premium paid by this member was only 10s. The larceny policy covers loss of money in transit and while at the office or house until banked at 5s. per cent. Complete security is attained by Official Security, Limited, underwriting with a strong group at Lloyd's, having an annual premium income of £200,000, a part of all risks not covered by the company's own funds consisting of an issue of debentures, premium income and surplus profits.

The attitude of this association towards surveyors as a class is that, owing to their control of the chief spending department of local authorities, and the supervision of the employment of labour and necessary connection with labour disputes, building by-laws, and the administration of various Acts of Parliament, their offices constitute a risk of insecurity of tenure probably double that of other officials. Hence, while surveyors are admitted to the scheme on the same terms as others, no special efforts to canvass them are made, as an undue proportion of such risks would endanger the funds of the association, especially during the present war, when the further risk of reduction of staffs and salaries consequent upon the restriction of capital outlay upon engineering works has to be faced. The author submits that these considerations prove that a scheme restricted to surveyors alone could not be so commercially sound as one embracing other less risky offices, the combination of which tends to give a fair average rate of loss which can be covered by a moderate premium, within the means of the less highly paid officers.

* From a paper submitted at the annual meeting of the Institution of Municipal and County Engineers.

The author wishes to bring prominently to the notice of members the

UNFAIR AND INEQUITABLE POSITION OF SURVEYORS

in comparison with other local government officials who in their respective duties have more or less protection from dismissal by appeal to a central authority.

Even an appeal to the Local Government Board may prove the official concerned to be resting upon a broken reed. There is on record a case of a medical officer of health not far from London who was called upon by his council to resign, and he was suspended from office. He appealed to the Local Government Board, who at this time saw no reason for the action of the council, and communicated accordingly to that authority, and the medical officer was duly reinstated. Rhetorical threats were made by members of the council to resign in consequence of the attitude of the Local Government Board. Further trouble and allegations followed, and on a second application to the Local Government Board the medical officer was dismissed.

Although the author believes that Mr. John Burns, when President of the Local Government Board, had a good deal of sympathy for members of our institution when the case for surveyors was laid before him, he is reputed to hold the view that if an official should have any friction with his council—even if that friction were caused solely by zeal and attention to duty—it would be better for the official to resign.

Mr. H. Samuel and Mr. Walter Long, by their attitude towards medical officers of health and sanitary inspectors, have shown that they more fully appreciate that in the administration in an impartial manner of the various Acts, by-laws and regulations, it is almost impossible for officials to steer clear of vested interests and subsequent unpleasantness, particularly in the smaller districts where local influences are more keenly felt than in the larger towns and cities. A surveyor has not even the right of appeal to the Local Government Board.

RISK OF LOSS OF OFFICE OR REDUCTION OF SALARY.

The risk of a surveyor losing his post otherwise than from his own misconduct is an extremely variable one, dependent upon a variety of causes, constantly shifting its storm centre, and often falling upon the most unsuspecting victim like a stroke of lightning. Amalgamation of one or more districts into a combined district or borough often results in a surveyor being thrown out of a situation, with meagre and inadequate compensation for loss of office; and especially so with a surveyor having only short service. The cry for economy and the work of Retrenchment Committees is a very frequent and favoured method of reducing expenditure, and often no consideration is given whether the dismissal of a member or members of a staff will impair the efficiency of the department. Reduction of salaries has been mooted, and may in some towns and districts be carried out on the plea of necessity and "war economy"; dismissals have already taken place.

NECESSITY FOR TENURE OF OFFICE.

The author believes that at the present time our case requires little, if any, proof to convince the present President of the Local Government Board that security of tenure is just as necessary for surveyors as other health officers, and the problem we, as an institution, have to solve is to find a scheme which will secure for surveyors the object at which we aim. It is very probable that if security of tenure were to be obtained by the right of appeal to the Local Government Board or some other central tribunal, the Government would insist upon having a voice in the future appointments and qualifications of surveyors, to satisfy themselves that only competent candidates were appointed to surveyorships, and the author considers that no member of our own or other properly constituted institution could cavil at this.

Is there a member of the institution who will uphold that security of tenure is not absolutely necessary, not only as a protection to surveyors, but also to the better and more impartial administration of local government than the conditions of employment

obtaining to-day can possibly admit? To err is human, and often one has to decide whether it is worth the worry and anxiety to place in the balance the risk of losing one's appointment on the one hand, and a strict and rigorous combat for the enforcing of some Act of Parliament, by-law or regulation on the other. An official may gain his point to-day, but what will the morrow bring? Insidious and tortuous are the ways of the malicious, and the appointment of surveyor is only held during the will and pleasure of the council employing him. This hard fact is always looking one straight in the face, and many members will, no doubt, at some time or other in their careers, have come to a sudden stop at this hurdle in their path of duty.

(To be concluded.)

PERSONAL.

Mr. J. Thomas, surveyor to the Gwyrfai Rural District Council, has resigned, and the council have appointed the clerk (Mr. D. G. Jones) and the sanitary inspector (Mr. D. Price) to perform his duties.

Mr. Charles le Maistre, Assoc.M.Inst.C.E., M.Inst.E.E., who has been in charge of the work of the electrical section since 1903, has been appointed secretary to the Engineering Standards Committee in succession to the late Mr. Leslie S. Robertson, M.Inst.C.E., who was lost with Lord Kitchener in the disaster to H.M.S. "Hampshire," while on an important Government mission.

KILLED IN ACTION.

Mr. T. Wood, surveyor to the Mutford and Lothingland Rural District Council, has lost his son in an engagement at the Front.

Mr. Alexander Brown, son of Mr. Angus Brown, formerly burgh surveyor of Wishaw, has, we regret to state, been killed at the Front. He was twenty-six, and a professional associate of the Surveyors' Institution.

Mr. E. B. Boothby, a much-respected member of the firm of Tuke & Bell, Limited (the Carlton Engineering Works, High-road, Tottenham, London, N.), who held a commission in the 13th Rifle Brigade, and was in charge of a machine gun section, was killed in action, we regret to state, on July 11th.

Reconstruction at Dublin.—In the House of Commons on Wednesday Mr. H. Samuel introduced a Bill to amend the law as to the erection of buildings and the making and improvement of streets in connection with the reconstruction of areas, streets, and buildings recently damaged or destroyed in Dublin, and for other purposes incidental, and it was read a first time.

Timber, Plywood, and Woodwork.—Our readers will no doubt be interested in a page advertisement in our issue of next week, which will give various particulars of timber, plywood, and woodwork which Messrs. C. Jennings & Co. have for sale. The page will be found useful for reference by all who make use of such goods. The firm's head office is at Pennywell-road, Bristol, but they have branches at Leicester, Porthcawl, and stocks warehoused at Swansea, Hull, Pembroke Dock, Neyland, Newcastle, Manchester, Liverpool, and elsewhere.

Municipal Employees' War Allowances.—Doncaster Town Council on Wednesday decided to continue to pay one-half to one-third wage war allowance to employees who presented themselves for attestation or enlistment prior to the date of closing of Lord Derby's first scheme; such one-half or one-third allowance to be paid whether or not the amount plus the Army pay and separation allowance, exceeds the civil remuneration, provided the Local Government Board consent. Employees who attested or enlisted subsequent to the date of the closing of Lord Derby's first scheme, and had not presented themselves for attestation or enlistment prior to that date, are to be entitled to one-half or one-third war allowance provided they had at the time of attestation or enlistment been for six months in the corporation service, and had attested or enlisted before the passing of the Military Service Act dealing with them respectively; and that the amount of the soldier's pay, separation, and other allowances, does not exceed their civil employment pay.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Gloucester T.C. (July 25th. Mr. W. O. E. Meade-King).—£1,606 for excess expenditure on works at the outfall sewers.—The town clerk, Mr. G. Sheffield Blakeway, stated that the work of improving the city outfall sewers was commenced on March 30, 1913, and had now been completed. The original amount authorised to be borrowed was £17,491, which was expended in payment to two contractors, the one carrying out the sewer work and the other the construction of a tunnel under the river Severn. The actual work originally provided for had been carried out at a lower cost than estimated by the engineer, but it had been found necessary to deepen the shafts on each side of the river and lengthen the syphons, and to widen the distance between the shafts and the river bank, with a resultant extra cost, including other small items, of £1,606.

Ilfracombe U.D.C. (July 27th. Mr. P. M. Crosthwaite.)—This was an enquiry with respect to the appeals of Miss E. Potter and Mr. W. C. Hutchings, regarding the apportionment for St. Brannock Park-road, taken over by the urban council. Mr. Hutchings objected to the apportionment of £9 4s. 6d. for making up the road, as he had not had any notice either preliminary or final. The road did not require repair, as the previous owner had done all that was necessary. While the first cost of making it up was estimated at £253, the actual cost was £443.—The surveyor (Mr. O. M. Prouse) said that was due to the alteration in the class of road decided upon.—Mr. Hutchings said the road should not have been made up until building operations had ceased.—Mr. Rowe said the notices had been sent to Miss Potter, but had been returned through the post. With regard to the increased work, power was given under the Act to amend, and no illegal action had been committed.—The inspector said he would visit the locality and report in due course.

Sheffield T.C. (July 26th. Mr. George L. Pepler).—This was an inquiry into an application for authority to prepare town-planning schemes in respect of two city areas.—It was stated by the deputy town clerk, Mr. E. B. Gibson, that in respect to the two areas known as Nos. 4 and 5, no objections had been put in with regard to the former, and it was only necessary to deal at length with No. 5. No. 4 area included Stumperlow, Fulwood, and Whirlow; and No. 5, Bannercross, Brincliffe, Kenwood Park, &c. The latter had an area of 142 acres. It was within reasonable distance of the city, and enjoyed excellent tramway facilities. It had been partly developed, and was also in course of further development. The corporation were desirous that the town-planning scheme should operate over the district with the object of limiting the houses per acre and securing the amenities of the neighbourhood. Mr. E. Partington, improvements surveyor to the corporation, described the density of housing in the adjacent estates. In Gainsborough-road there were eleven houses to the acre, in Machon Bank-road forty-nine to the acre, and in Osborne-road thirty to the acre. In the Violet Bank-road the density was twenty-six and a-half houses per acre. In another place 109 houses had been erected on an area formerly occupied by one house. It was this sort of thing which the corporation desired to control.

APPLICATIONS FOR LOANS.

Birkenhead T.C.—£2,500 for the provision of benzol recovery plant at the gasworks.

Rochester T.C.—£7,020 for the main drainage scheme.

FORTHCOMING INQUIRY.

SEPTEMBER.

Town Planning. £

13. **Neath.** (Mr. George L. Pepler) ... ... —

Road Tarring in Surrey.—In his annual report on the main roads, Mr. A. Dryland, the county surveyor of Surrey, states the expenditure on tarring outside certain urban districts was £13,362, of 1·73d. per yard, the length of roads tarred being about 157 miles. Owing to higher prices, the cost increased by ·11d. per yard super.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars have reached us during the present week. Other reports will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

East Sussex C.C.—It has been agreed to meet the Kent County Council with respect to the repair of Brim Bridge by subscribing towards the cost a sum not exceeding £70.

Edinburgh T.C.—The Electric Lighting Committee recommend an extension of the McDonald-road power station, at an estimated cost of £1,300.

Essex C.C. It is proposed to build a school for 150 girls at Brentwood and a school for 470 boys at Leyton.

Grimsby T.C. It has been agreed to proceed with the erection of a corrugated iron building as a temporary fire station.

Guiseley U.D.C.—The council, at a meeting in committee, considered a request from the military authorities for the provision of an auxiliary hospital in Guiseley, and a resolution was passed to invite subscriptions for the purpose of equipping the town hall with beds for twenty-five patients.

Okehampton T.C. Tenders are to be invited for the construction of a cattle market in Lodgeroad.

Torquay T.C.—A tender at £143 has been accepted for heating the bath-rooms at the Bath Saloon by steam radiators, this being in addition to the architect's estimate of £75 for builder's work.

HOUSING AND TOWN PLANNING.

Coventry T.C. The annual accounts of the Housing Committee show a loss of £563. It was stated that the chief causes of the deficiency were the rise in the rate of interest and taxes. In the houses which were being finished the rents were being raised on occupation, and the committee were fixing the rents at Stoke Heath at a figure which would ensure there was no loss.

Southend T.C. It has been agreed to apply to the Local Government Board for sanction to prepare a town planning scheme for the eastern area of the borough and portions of the Shoeburyness urban and Rochford rural districts.

Shrewsbury T.C.—Authority has been given the Improvement Committee to apply to the Local Government Board for permission to proceed with a town planning scheme. The committee submitted details of an arrangement which had been arrived at for laying out Lord Barnard's Raby estate adjoining Belle Vue Gardens, and Longden road on town planning lines, and these were approved. Lord Barnard gives up 3,500 yds. for widening Longden-road, and the cost for widening is estimated at £2,600.

MOTOR TRANSPORT.

Coulsdon and Purley U.D.C.—It is proposed to purchase a motor hose van.

Poplar B.C.—It is proposed to purchase a motor-car for the works department at a cost not exceeding £600.

Salford T.C.—The council on Wednesday approved of a proposal by the General Purposes Committee to purchase four motor ambulance vans for the conveyance of wounded soldiers to and from hospitals, and to present them to the Red Cross Society. It was stated that the action of the corporation in this matter had already served as an example to others, with the result that thirteen other motor ambulances had been forthcoming.

Surbiton U.D.C.—The removal of house refuse by motor vehicles is being considered by the council.

Tynemouth T.C.—It has been decided to purchase a motor fire engine.

PARKS AND OPEN SPACES.

Bradford T.C.—A new recreation ground for the Little Horton district—the fifth added to the open spaces of the city this year—was opened last week. It is about 12,640 sq. yds. in extent, and was taken over by arrangement from the Street Improvement Committee.

Golcar U.D.C.—Arrangements are being completed for adapting a plot of land between Leymoor Top and Swallow-lane, on the Savile estate, as a park and recreation ground.

REFUSE COLLECTION AND DISPOSAL.

Bristol T.C. The city engineer, Mr. L. S. McKenzie, reported that a commencement had been made with the collection of waste paper. A number of circulars explaining what was required of householders had been issued and 5,500 sacks distributed. So far only 10 tons of waste paper had been collected, but the amount would rapidly increase and the system would shortly be extended to other districts.

Nantyglo and Blaina U.D.C.—The surveyor, Mr. W. J. Davies, has been instructed to report on the provision of a refuse destructor for the district.

ROADS AND MATERIALS.

Bexhill T.C. The Road Board have sanctioned a grant of £300 towards the cost of repairing Barnham road.

Branston R.D.C. It has been decided to purchase a tar-sprayer at a cost of £25.

Bungay U.D.C. The council have accepted the tender of the Mountsorrel Company for a supply of granite at 16s. 6d. per ton, and for steam rolling at 27s. 6d. per day.

Clonakilty R.D.C.—The council have approved an estimate, at £580, for repairs to the road from Clonakilty to Ring.

Cumberland C.C.—Consideration is being given by the Highways Committee to the repair of the roads in the Longtown district from Kingstown to the Scottish boundary, and the improvement of the road from Sark Bank House, on the Glasgow main road, to its junction with the Longtown Springfield road.

Dorset C.C.—The Road Board have offered to lend the county council £7,000, free of interest, for seven years, for the construction of a new coast road at Lyme Regis. German prisoners of war are to be employed in the work.

East Riding C.C.—The Highways and Bridges Committee recommend the county council to contribute £350 towards the purchase of a second steam roller by the Bridlington Rural District Council.

East Sussex C.C.—The county council have adopted a proposal to inform the urban authorities that, in consequence of the difficulty experienced in obtaining ordinary macadam, the council would allow the use of tarred macadam during the current year for the repair of main roads.

Lindsey C.C.—The county surveyor, Mr. J. Thropp, reports that owing to the difficulty of getting tar and chippings, only a portion of the main roads have been tar-sprayed. He also reports that the Road Board have consented to contribute £747, being one-half of the estimated cost of the tar-spraying recommended by the Highways Committee.

Mallow U.D.C.—It has been agreed to expend an additional sum of £200 on the main street improvement.

North Riding (Yorks) C.C.—The county council have passed the following grants for the improvement of roads: Resurfacing with tarred macadam the York and Northallerton road between Easingwold and Fleet Bank, £3,896 (Road Board grant £1,400); Darlington and Boroughbridge road, between Blackman Plantation of Croft, £1,700 (Road Board grant £600); tar-spraying various roads in the Riding, £3,386 (Road Board grant £1,000); Whitby and Pickering road, tar-spraying in the Pickering rural district, £660 (Road Board grant £369); Richmond and Darlington road, strengthening and repairing £3,087 (Road Board grant £1,000).

Notts C.C.—In the report of the Highways Committee it was stated that the Road Board had agreed to make a grant to the council of £1,555 towards the cost of surface tarring which it is proposed to carry out this summer on Tarmac roads. Sir Lancelot

Rolleston stated that the committee were endeavouring to prevent what was happening in many parts of the country namely, the deterioration of the roads. In that he believed they were succeeding, and the roads were rather improving. He also mentioned that the work of widening Thackham's-lane at Chilwell, and the construction of the new road across the fields from Attenborough lane, had been commenced. The cost would be £9,200, £6,000 of which was for a new bridge.

Salop C.C.—It was reported that the Road Board had forwarded grants aggregating £2,200 in respect of tar-surfacing and tar-painting improvement works to be carried out on rural main roads during the ensuing year. Additional grants had also been received for surface tarring a number of main roads for military purposes.

South Stoneham R.D.C.—A scheme, supported by voluntary subscriptions, is being promoted for the repair of Broadlands-road, Hampton Park. The surveyor of highways, Mr. F. Heather, who has collected between £60 and £70 on behalf of the fund, has been thanked by the council for the trouble he is taking in the matter.

Surrey C.C.—The Trinidad Lake Asphalte Company, who have had a contract with the council for the last five years for the maintenance of the London and Portsmouth road within the district of the Maldens and Coombe at 1s. 2d. per yard super., have agreed to continue the work for another five years at 1s. 5d. per yard.

West Sussex C.C.—A resolution has been passed affirming that in view of the large increase of heavy motor traffic on the roads, it was most important that heavy motors should pay a tax or contribution towards the expense of the upkeep of the roads commensurate with the use they make of them.

SEWERAGE AND SEWAGE DISPOSAL.

Coulsdon and Purley U.D.C.—The council recently sealed an agreement with the Croydon Corporation for the reception and disposal of the local sewage. The question has been under discussion by the two authorities for some years, and the completion of the negotiations has been received with much satisfaction. Practically it means that the urban council will pay 7d. in the £ for sewage disposal over a larger area than under the old agreement, while the differing charges of 6d., 8d., and 1s. will be done away with.

East Riding (Yorks) C.C.—The county council have agreed to get the attention of Parliament called to the "failure of the War Office and the Local Government Board to give attention to the repeated representations made by the council" with respect to the disposal of sewage at a certain military camp.

Martley R.D.C.—It has been decided to take up a further loan of £1,000 for the Hallow sewerage scheme.

Melton Mowbray R.D.C.—The sanitary inspector has submitted a preliminary report on the sewerage and sewage disposal of Asfordby Hill. He proposed, subject to arrangement with various parties concerned, to carry a 6-in. sewer across the Asfordby tunnel and county council garden to join the main sewer running down the Pasture Hill to the valley. It would be also necessary to find a new site for the treatment of the sewage, the combined volume of which, from the hill and valley, would be 36,000 gallons per twenty-four hours. He had selected as a site for the farm a field on the glebe land, and the area they would require to take would be about 1 acre. The sewage from the valley would require lifting to the new site, and he proposed to do this by means of an automatic lift. An approximate estimate of the cost was £1,723.

Middlesex C.C.—The county council adopted recently a strongly worded recommendation by the Rivers Committee relating to the condition of the Wembley sewage works owing to the action of the Local Government Board in refusing sanction to a loan for their reconstruction.

Woolwich B.C.—With regard to the supervision of drainage work in connection with the hutments and hostels now being erected in various parts of the borough, the Works Committee have reported that the War Department is exempt from the operation of the Metropolis Management Acts and the London County Council by-laws relating to the construction and supervision of sewers and drains. Plans in connection with these buildings are submitted to the borough council as a matter of courtesy and for the information of the council only, and not as formal applications for the council's approval.

WATER, GAS, AND ELECTRICITY.

Barking U.D.C.—Application is being made to the Local Government Board for sanction to a loan for additional electric mains and transforming plant.

Keighley T.C.—It was reported that from a loss of £2,000 on the first year's working of the electricity undertaking there was now a profit of £758, and it was hoped to show better results in the future.

Liverpool T.C.—A special report has been presented to the Water Committee on the subject of the water supply, and it was indicated in the course of a discussion at the city council that, while economy in the use of water is imperative, an effort will be made to induce the council to rescind a recent resolution postponing the application for Parliamentary powers to construct the proposed third-line pipe from Vyrnwy to Prescot. Meanwhile plans and estimates for the project will be prepared.

Maidstone T.C.—An extension of the electric cable is to be effected at an estimated cost of £120.

Poplar B.C.—Considerable electric main extensions are contemplated in the borough, and it is also proposed to build a new sub-station in High-street.

Rotherham T.C.—A scheme is being considered for the provision of generating plant for the electricity works at a cost of £50,000.

Southgate U.D.C.—The surveyor, Mr. Sutherland, has received instruction to obtain estimates of the cost of boring and maintaining an artesian well for the public baths.

Stoke-on-Trent T.C.—The council have approved the scheme for plant extension at the central power-house, at an estimated cost of £12,000.

Widnes T.C.—Plant for the production of toluol and benzol is to be installed at the gasworks, at an estimated cost of £1,500.

Worthing T.C.—The council have agreed to the electrical engineer's proposal to fit an additional fuel pump to the larger of the two Diesel engines, at an estimated cost of £269, to enable the engine to be worked with tar oil as well as with residual petroleum.

MISCELLANEOUS.

Chiswick U.D.C.—It has been agreed to loan a piece of land on Back Common to the War Office for the purpose of a miniature rifle range.

East Sussex C.C.—An expenditure of £1,250 has been sanctioned on the dumping of shingle for the protection of the works of sea defence at Rottingdean. It was stated that the £5,000 voted some two years ago for works of sea defence at this place had been expended.

Phillack U.D.C.—Difficulty having been experienced in getting carters to do the council's work at 7s. a day, it has been decided to raise the scale of payment to 8s.

South Shields T.C.—A nett profit of £6,504 was earned by the tramway undertaking last year, as compared with £5,594 in the previous year.

Twickenham U.D.C.—All the regular men in the employment of the council have been granted a week's leave of absence, with full pay.—The gangers and general labourers on works of sewer and road maintenance have been granted an increase of ½d. an hour, from 7½d. and 6½d. to 8d. and 7d. respectively, but they are to be graded into two classes.

Willesden Paper and Canvas Works.—Although as a result of a recent fire this company's works were totally destroyed, the directors have every reasonable expectation of resuming operations by November 1st. The rebuilding of the company's factory has already commenced.

Shanghai's Roads.—"I took particular note of the excellence of your roads and the large number of motor cars," was a remark made by Dr. Reinsch, American Minister to China, to a representative of the *North China Daily News*, when leaving Shanghai on July 5th, after a four days' visit.

FOR OTHER ADVERTISEMENTS
See End of Paper.

WANTED immediately, Hire or Purchase, 6-8-ton Steam Roller; good working order.—Full particulars and lowest cash to Box 1,579, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C. (3,062)

SOME RECENT PUBLICATIONS.*

The Planning of the Modern City. By Nelson P. Lewis. Price $3.50 nett. New York: John Wiley & Sons.

Mr. Lewis's book on "The Planning of the Modern City" is a valuable addition to the literature on this subject. It is an important work for the reason that it approaches city planning from a new point of view—namely, from that of the municipal engineer. Mr. Lewis makes the point that up to the present time most of the literature has been contributed by architects who have emphasised the architectural and artistic side, and by students of city government who have regarded it as an administrative problem. Mr. Lewis's idea is that city planning is essentially the work of the municipal engineer. The engineer "is the first man on the ground," he holds the key to the situation, and should be the official most interested in the subject. At the very beginning attention is called to the necessity of correcting mistakes, and as an illustration of the difficulty, expense and time required to make changes the new "Strand to Holborn" improvement in London is referred to at length.

The present work differs from many of the books previously published in that most of the illustrations are modern. Mr. Lewis says that "while we may well look to the ancient cities for inspiration, we shall make a great mistake if we shall use them as models. Modern cities must be adapted to modern needs." The characteristic of the book which above all others will strike the attention of the reader is its sanity. Mr. Lewis, while a man of vision, is always practical. The book reflects the man, and the man ably fills his position as the chief engineer of the Board of Estimate and Apportionment of the City of New York. In many ways this is the most important municipal engineering position in the United States. The engineering profession, and especially municipal engineers, will gratefully receive this excellent treatise on city planning.

The various reports and papers of the congress on "Home Problems After the War," held in April last at Caxton Hall, London, have now been published, and are obtainable from the National Housing and Town Planning Council at the price of 5s.

THE HYDRAULIC MINING CARTRIDGE.

The hydraulic mining cartridge, a machine for breaking rock, concrete, &c., which was described in these columns some months ago, and which has been used at many electrical generating stations and in many docks and harbours during the last few years, has recently been used in connection with an important Government contract for alterations to dock walls in a North of England seaport. The work involves the disintegration of about 30,000 cub. yds. of concrete, which was laid down about twenty years ago. The walls are approximately 10 ft. above water level and 30 ft. below, and a series of holes have been drilled about 6 ft. apart and 38 to 40 ft. deep.

The upper sections, averaging about 10 ft. in thickness, are first removed to a depth of 15 to 20 ft.; below this depth divers are employed to insert the machine in the hole, pressure being applied from the pump at the surface. The power required to break the concrete varies according to the conditions of each operation, but is usually about 150 to 200 tons, representing a pressure of 6 or 8 tons per sq. in.

The breaking up of the walls by explosives is impossible in this instance, as not only is it desired to avoid explosive shots because of their effect on valuable plant and war vessels in the vicinity, but because portions of the walls below water level must be secured from damage and shock of every kind.

Besides the machines used in these important operations, hydraulic cartridges have recently been sent out to Algoa Bay for similar work.

Women Labour.—Nuneaton Corporation are employing women on the repair of the roads.

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

SEWAGE FARM MANAGER.—August 5th.—East Barnet Valley Urban District Council. £2 2s.—£2 10s. per week.—Mr. T. A. Buckley, clerk, Council Offices, Station-road, New Barnet.

TEMPORARY ASSISTANT INSPECTOR. — August 10th.—Corporation of Bootle. £100-£110.—Mr. J. Spencer Tumilty, town clerk, Town Hall.

TEMPORARY ASSISTANT.—August 11th.—Surrey County Council. £3 per week.—Mr. A. Dryland, county surveyor, County Hall, Kingston-on-Thames.

DISTRICT SURVEYOR.—August 14th.—Alresford Rural District Council. £150.—Mr. J. Ridley Shield, clerk, East-street, Alresford, Hants.

TEMPORARY MAIN ROAD SURVEYOR.—August 19th.—Cornwall County Council. £150 per annum.—Mr. L. D. Thompson, county surveyor, County Hall, Truro.

SURVEYOR OF HIGHWAYS.—Peterborough Rural District Council. £125.—Mr. W. B. Buckle, clerk, 49 Priestgate, Peterborough.

TEMPORARY DRAUGHTSMAN.—Corporation of Blackburn.—Borough and Water Engineer, Town Hall, Blackburn.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Buildings.

BRIDGNORTH.—August 10th.—For work in connection with the construction of a wall at Winterburn Bridge, for the rural district council.—Mr. F. Richards, surveyor Oldbury, Bridgnorth.

WILTON.—August 12th.—For the repair of a bridge, for the rural district council.—Mr. R. A. Skelton, surveyor, Wilton-road, Bemerton.

LICHFIELD.—August 17th.—For the construction of a brick and concrete culvert, for the rural district council.—Mr. C. D. Rawstron, surveyor, Station-road, Lichfield.

CARDIGAN. — For cementing and waterproofing walls, constructing new lead valleys, improvements to water supply, and general repairs to a school, for the Education Committee.—Mr. G. Dickens-Lewis, county architect, Aberystwyth.

Engineering: Iron and Steel.

MANCHESTER.—August 10th.—For the supply of an electrically-driven circulating water booster pump, for the Electricity Committee.—Mr. F. E. Hughes, secretary, Electricity Department, Town Hall.

SINGAPORE.—August 14th.—For the construction of a steel bridge, for the Public Works Department.—Chief Clerk, Colonial Engineer's Office, Singapore.

BARKING.—August 15th.—For the supply of extra high-tension cables, main switchgear, sub-station switchgear, and transformers, for the Electricity and Tramways Committee.—Mr. W. E. Kidner, acting engineer and manager, Electricity Works, East-street, Barking.

LONDON.—August 22nd.—For the supply of 1,000 forged steel driving wheel tyres, and 500 forged steel trailing wheel tyres, for electric tramcars, for the county council.—Chief Offices, London County Council Tramways, 62 Finsbury-pavement, E.C.

STOCKBRIDGE.—For the creation of 80 yds. of fence and 60 yds. of retaining wall, for the rural district council.—Mr. W. J. Ayles, district surveyor, Broughton, Stockbridge.

Roads.

BASINGSTOKE.—August 10th.—For steam rolling, for the rural district council.—Mr. R. Forrester, surveyor, Chequers-road, Basingstoke.

ROMFORD.—August 14th.—For the supply of 920 tons of granite, for the rural district council.—The Highway Surveyor, 16a South-street, Romford.

JOHANNESBURG.—August 14th-15th.—For the supply of 1,600 tons of tar or tar substitute, for the municipal council.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, E.C.

LONDON.—August 15th.—For the supply of 370,000 creosoted deal paving blocks, for the county council.—Chief Officer, L.C.C. Tramways, 62 Finsbury Pavement, E.C.

SCUNTHORPE.—August 30th.—For the supply of any quantity up to 400 tons of broken granite of approved quality, for the urban district council.—Mr. Herbert Heap, engineer and surveyor, 110 High-street, Scunthorpe.

Sanitary.

CHEADLE.—August 10th.—For the construction of an additional catchpit at the sewage works, for the urban district council.—Mr. F. R. Gibbins, Council Offices, Cheadle.

WANDSWORTH.—August 21st.—For surface water drainage works at Wandsworth Cemetery, Magdalen-road, Wandsworth, for the borough council.—Mr. P. Dodd borough engineer, 215 Balham High-road, London, S.W.

Stores.

GOSPORT.—August 10th.—For the supply of artificial stone paving, broken stone for macadamising, brooms, castings, cement, lime, disinfectants, stoneware pipes and ironmongery, for the urban district council.—The Surveyor, Town Hall.

ROCHESTER.—September 5th.—For the supply of road metal, brooms, horse hire, and tools, for the corporation.—Mr. W. Banks, city surveyor, Guildhall.

Miscellaneous.

PLYMOUTH.—August 7th.—For the supply of a motor van, for the corporation.—Chief Constable, Central Police Office.

WARSOP.—August 14th.—For laying out a portion of the new burial ground, for the urban district council.—Messrs. Vallance & Westwick, White Hart-chambers, Mansfield.

SOUTHAMPTON.—September 4th.—For dredging work in the River Itchen, for the Harbour Board.—The Engineer, Harbour Board's Offices.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.

ERITH.—For laying cast-iron and stoneware sewers and air main, construction of an ejector chamber, and the installation of three ejectors, for the urban district council.—Mr. H. Hind, surveyor.

A. Hyslop, South Wales	£4,708
H. Farrow, Brixton, S.W.	4,429
G. Wimpey & Co., Hammersmith, W.*	3,997

ERITH.—For the extension of the open-air swimming bath, for the urban district council.—The Surveyor:—

— Myall, Southend-on-Sea	£595
R. N. Marrable, Leytonstone *	527
Friday & Sons, Erith *	472

SOUTHAMPTON.—For the construction of a conduit for electric mains, for the Harbour Board.—The Engineer:—

Grounds & Newton, Bournemouth	£154
J. Douglas, Southampton	130
C. Daysh, Southampton	105
J. J. Udall & Co., Limited, Southampton *	103

APPOINTMENTS OPEN.

SURREY COUNTY COUNCIL.
COUNTY SURVEYOR'S DEPARTMENT.

Temporary Assistant (ineligible for Military Service) required with a knowledge of Surveyor's accounts, shorthand, and typewriting. Salary £3 per week. Applications and testimonials to reach the undersigned by Friday, 11th August.

A. DRYLAND,
County Surveyor.

County Hall,
Kingston-on-Thames. (3,057)

COUNTY BOROUGH OF BLACKBURN.

WANTED at once, Temporary Draughtsman for Waterworks Department. Must be ineligible for Military Service. Apply, stating salary required, experience, and full particulars, to the Borough and Water Engineer, Town Hall, Blackburn. (3,056)

TENDERS WANTED.

SCUNTHORPE URBAN DISTRICT COUNCIL.

SUPPLY OF ROAD MATERIAL.

The above Council invite Tenders for the supply of any quantity up to 400 tons of Broken Granite of approved quality, delivered in trucks, carriage paid at Frodingham Station, G.C. Railway.

Official Tender Forms and further particulars may be obtained at the office of the Engineer and Surveyor (Herbert Heap, Assoc.M.Inst.C.E.), 110 High-street, Scunthorpe.

Tenders, duly sealed and endorsed "Granite," are to be addressed to me and delivered at the Council's Offices, 110 High-street, Scunthorpe, on or before Wednesday, the 30th day of August, 1916, and must be accompanied by an average sample of the material.

The Council do not bind themselves to accept the lowest or any Tender.

GEORGE E. DAVY,
(3,061) Clerk to the Council.

METROPOLITAN BOROUGH OF WANDSWORTH.

TO CONTRACTORS AND OTHERS.

THE WANDSWORTH BOROUGH COUNCIL invites TENDERS for SURFACE-WATER DRAINAGE WORKS at WANDSWORTH CEMETERY, MAGDALEN-ROAD, WANDSWORTH, S.W.

The Specification, Drawings, and Form of Contract may be seen, and Forms of Tender obtained, at the Office of the Borough Engineer, Mr. P. Dodd, M.Inst.C.E., 215 Balham High-road, S.W.

Tenders (each enclosed in a sealed envelope, endorsed "Tender for Surface-water Drainage Works, Wandsworth Cemetery") are to be delivered at the Council House, East Hill, Wandsworth, S.W., or may be placed by the person tendering in the box provided for the purpose, not later than 12 o'clock noon, on Monday, the 21st August. No Tender will be received unless it is made upon one of the Forms issued for the purpose.

The Council does not bind itself to accept the lowest or any Tender.

D. A. NICHOLL,
Town Clerk.
July 26, 1916. (3,059)

APPOINTMENTS WANTED.

DEMONSTRATOR.—Lady, experienced (Naval Officer's daughter), requires permanent position; gas, electric light, domestic patents, or similar.—Reply, stating remuneration offered and full particulars, Box 1,576, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C. (3,044)

YOUNG Gentleman (20 years), with army discharge, requires appointment in Architect's or Surveyor's Office. Tracing, designing and clerical work. Good professional references. Apply W. E. Jefferiss, "Elm Villa," North-street, Romford. (3,060)

EX-PUPILS AND JUNIOR ASSISTANTS.

CIVIL Engineering and Surveying Assistant (23), rejected for military service, desires appointment. Passed A.M.I.C.E. Exam., is A.M.Inst.M. and Cy.E. Seven years in Municipal Engineer's office. Good draughtsman, surveyor and leveller.—Box 1,578, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C. (3,055)

MISCELLANEOUS.

WANTED, The Surveyor, Vols. 24 to 42 inclusive, and Vol. 44, in publishers' cases or unbound. Offers to the Publisher, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C.

The Surveyor

And Municipal and County Engineer.

Vol. L. AUGUST 11, 1916. No. 1,282.

Minutes of Proceedings.

Security of Tenure.

The paper by Mr. J. H. Drew entitled "Surveyors: Their Security of Tenure and Defence" was among the "slaughtered innocents" at the Blackpool meeting; otherwise there can be no doubt that there would have been a lively discussion on a matter which so materially affects the members of the institution. That there is among the members a surprising amount of apathy on the subject is proved by the result of the efforts to formulate a mutual defence scheme, which, in spite of strong backing from influential members of the institution, came to nothing a few years back. This apathy is all the more surprising as there are many well-known cases where surveyors have been unfairly and badly treated. The nature of their profession frequently makes it necessary for them to sit in judgment on some member of their council, and as a result they are often subjected to petty persecutions, which are intolerable in the case of a sensitive man. The security afforded by the Local Government Board to medical officers of health and sanitary inspectors makes the case of the surveyor still more anomalous. If it is necessary in one case more than another it is surely in that of the surveyor, as the official whose duty will most likely bring him into collision with some member of his council. The jerry-builder and land-jobber still find a way on to many councils, and the surveyor cannot expect to get a sympathetic support from them in his efforts to see that the by-laws relating to new buildings and streets are properly carried out. Improvements carried out either under the Town Planning or the Public Health Acts frequently rouse considerable and bitter opposition from influential ratepayers, and while human nature remains unchanged a scapegoat will be most often found in the poor surveyor. In the larger towns or the county councils the surveyor's lot is generally much happier than in the smaller districts. The class from which the more important towns and counties draw their councillors is generally better than in the smaller urban and rural districts, and there is safety from the influence of small cliques in the greater number of councillors on the big council. One bitter and unscrupulous councillor, always on the pounce, can in a small district frequently make an official's life hardly worth living. There are so many ways in which this petty spite can be wreaked on a man who is unable or unwilling to see eye to eye with his councillors, that it is only against the most glaring case of injustice that protection can be provided. The cry for economy is often raised by these men as providing a means of "straffing" the surveyor by giving them an opportunity of moving a reduction in his salary. On occasion this spite goes further, and leads to the surveyor being thrown out of office without compensation or provision in any shape or form. Even in the case of amalgamation, if the surveyor who may have had twenty or thirty years' municipal experience with various councils has only had a few years' service with the amalgamated district he may find himself stranded with a paltry and inadequate compensation for loss of his office at a time of life which makes it next to impossible for him to secure another suitable appointment.

That there is little immediate prospect of the Government giving the desired recognition and protection must be admitted, but Mr. Drew suggests that when the war is over an early opportunity should be taken of sending another deputation to interview the Local Government Board on the subject. In the meantime he is of opinion that it is necessary to provide self protection by accepting the offers made to surveyors by the association registered as Official Security, Limited, which offers policies of insurance against loss or diminution of official salary, litigation risks, and larceny of money in transit. There are several other important points raised in the paper, such as the appointment of unqualified and inexperienced men as surveyors, and superannuation. Our own columns have, unfortunately, provided many glaring cases where men with no suitable experience have been appointed surveyors simply owing to having friends or relatives on the council. The veto of the Local Government Board which is now exercised in the case of the appointment of inexperienced men as sanitary inspectors should be extended to surveyors, and this would naturally follow any action they may take to afford surveyors security of tenure. Superannuation is, in Mr. Drew's opinion, not of much use without security of tenure, but once this security is obtained he believes that superannuation would quickly follow.

* * *

Diesel Oil Engines.

The use of internal combustion engines for all branches of municipal work has become very general during the past few years, and therefore the paper on "Diesel Oil Engines," by Mr. F. R. Phipps, which is reproduced elsewhere in this issue, is not only opportune, but a valuable con-

tribution to the literature on the subject. Up to the present time the use of the Diesel engine in this country has been chiefly confined to the generation of electricity, but there does not appear to be any sufficient reason why it should not also have a greatly extended use for pumping plants in connection with sewage and waterworks. The most suitable prime mover to be used can only be arrived at after a very careful consideration of all the factors bearing on the matter. Steam, oil, and gas engines will give very different results so far as working costs are concerned according to the locality in which the engines are erected, and will depend chiefly on the cost of fuel in the various districts. In many cases it is possible to utilise the steam raised by the destruction of refuse for the generation of electricity for lighting, tramways, or pumping, and in these cases there can be little question that steam will be the most economical form of power. Again, where coal is cheap, as in the colliery districts, steam will nearly always beat other competitors. There are, of course, other factors to be taken into account as well as cost of running, such as the size of buildings and æsthetic and hygienic considerations, but speaking generally the running cost is nearly always the deciding factor.

Mr. Phipps gives some very useful figures with regard to the costs of various forms of power, which he obtained before deciding on the form of engines to be used in the electricity scheme he has recently carried out for the Basingstoke Council. Though very different results would bound to obtain in towns near the coalfields, the figures given are still of great interest, and will be very helpful to many surveyors in different parts of the country. Town's gas he dismisses as too costly at 3s. 1½d. per 1,000 cub. ft., as this works out at ·75d. per b.h.p. hour. Producer gas with anthracite at 30s. per ton costs at Basingstoke ·25d. per pump horse power (roughly ·22d. per b.h.p.). Steam with coal at 26s. 6d. per ton costs ·35d. per p.h.p. (·30d. per b.h.p.), while the Diesel engines with oil at 82s. per ton gives a b.h.p. of ·22d. One great objection at the present time to the adoption of the Diesel oil engine is that the crude oil used in these engines has practically gone up in the same ratio as petrol or petroleum, which is in most places much greater than the advance in the price of coal. Mr. Phipps says three years ago he obtained his oil fuel at 45s. per ton; to-day he pays 82s., and has entered into a contract for next year at 146s. 6d., with the important proviso that it is to drop to 50s. per ton six months after peace is declared. The paper touches on many other practical details of working, all of which contribute to the success or otherwise of the Diesel oil engine. Thus he insists on the need of choosing an engine of low speed, with as low a mean effective pressure as possible, of providing a sufficiently firm and massive foundation, so as to avoid vibration, the prevention of nuisances from noise and fumes from the exhaust, the silencing of the air inlet pipe, the adequate lubrication of all parts of the engine, and the arrangement of the engines, cooling, and details of erection. Mr. Phipps is to be congratulated on the very successful working of his electricity scheme, for, despite the fact that the station has only been completed since the war began, and the disadvantage of the high cost of fuel and other increased running expenses which the war has entailed, a nett profit of £325 has been made on the first year's operations.

* * *

Diversion of Highways.

The Act which was recently passed for the purpose of simplifying the language in which criminal indictments are drawn serves as a reminder that there are other directions in which legal reform in the nature of simplification would be welcome, as, for example, in the case of the procedure for securing the diversion or stopping up of an unnecessary highway. At common law a highway which has once been dedicated to the public remains a highway for ever, but this general rule was modified in 1835, when, by the Highway Act, a procedure was laid down by which unnecessary highways could be stopped or diverted. This procedure is in itself by no means simple, and it has been further complicated both by the extraordinary language of one of the sections and by the judicial interpretation of others. Take as an example the simplest possible case—namely, where a highway authority commence proceedings of their own motion. The first step is that they must, "by order in writing, direct the officer whom they appoint to deal with the matter to apply to two justices to view." It has been held that the view of the justices must be a joint one, and further that if two justices view the highway and refuse to make an Order, application may be made to two other justices without any fresh resolution being passed. So far the procedure is at least clear, but the next provision is really difficult to understand. It relates to the giving of notices, if the justices approve of the proposed diversion or stopping up. In such a case the justices shall direct the local authority to affix a notice in the prescribed form "at the place and by the side of each end of the said highway from whence the same is proposed to be diverted or stopped up."

It is hardly surprising that these last words have been the subject of litigation, and they have been interpreted as meaning that the notices are to be put at the side of (and not *in*) the highway at the two ends of the portion to be diverted or stopped up. When the justices are satisfied that the necessary notices have been duly published, and a plan has been delivered to them particularly describing the old and the proposed new highway "by meters, bounds, and admeasurement thereof," they have to certify in writing the result of their view, giving reasons. The certificate and plan are then as soon as possible to be lodged with the clerk of the peace for the county, and, having been kept for four weeks, must be read at the next quarter sessions in open court. Finally, unless any aggrieved person lodges an appeal against the proposal, the documents are enrolled among the records of the Court and the Order for stopping up or diverting the highway is made. We have indicated the procedure in the barest outline. If the highway be situated in a rural parish, the consent of the parish council and of the district council is required for its stopping up or diversion, while in all cases of diversion consent in writing is necessary on the part of the owner of the land through which the diversion is to be made. All this is very complex, at least to the lay mind, and the whole procedure is capable of simplification. After all, a procedure which was adapted to the conditions of almost a hundred years ago is naturally not quite in accordance with modern ideas. Perhaps the matter of the simplification and codification of certain branches of the law may be one of the tasks the Government will be able to take in hand "after the war."

* * *

The Bill for Dublin Rebuilding.

The difficulties of Irish legislation just now have their origin in politico-social movements which need not be enlarged upon here except to say that it would be regrettable if these influences upon one side or another jeopardised the effort on behalf of the reconstruction of Dublin which is being made by the Government. The Bill for this purpose, as it is drafted, makes

provision for the compulsory purchase of land by the Dublin Corporation for the purpose of widening or otherwise improving streets by means of an Order submitted to the Local Government Board, and confirmed by that authority. This is a substitution of the Government department for the procedure under sec. 203 of the Public Health (Ireland) Act, 1878, or any subsequent amendments of this measure. Sec. 41 of the Act is extended so as to enable the corporation to make by-laws "with respect to the structure, materials, design, alignment, and general symmetry of the new buildings." This is, of course, a considerable advance upon the powers given to the corporate authority under the existing law, and it is an essential element of the situation if any concession is to be made, as appears to us highly desirable, to the very general demand for the rebuilding of certain at least of the ruined areas upon improved lines. For the purpose of reconstruction the corporation are authorised to advance money on the security of the ownership of the site of any house or building which has been damaged or destroyed, the advance not to exceed the difference between the amount which the Local Government Board certify to be the total cost of rebuilding or restoration, and the amount of the compensation granted in respect of destruction or damage. These are the main provisions of the Bill, and so far as they go there is little to which exception can be taken. But it may be questioned whether they go far enough in attaining one of the objects in view, which is, we take it, to provide a worthy scheme of reconstruction, and take advantage of what may be termed a unique opportunity. There is, therefore, much cogency in the proposition of Mr. R. M. Butler, of Dublin, that some administrative commission or tribunal, working in harmony with the corporation, should be created to deal with the many problems of practical construction and planning, as well as of beauty and fitness, such as it is hardly possible a municipal council could solve. Some such advisory body would seem to be essential if the best results are to be obtained alike from the architectural and economic points of view.

* * *

The Commercial Value of Improvements.

Attention has been called to the remark made by Mr. John Burns, in the course of the recent discussion on the Bill relating to the strengthening of Charing Cross railway bridge, that "beauty is not only pleasing to the eye and consoling to the mind in a great city; it pays in solid cash." This dictum was made the text of an excellent article by Mr. Ernest Newton, R.A., the president of the Royal Institute of British Architects, in a recent issue of the *Daily Telegraph*. In the course of his article Mr. Newton called attention to the connection which necessarily exists between the corporate life and aspirations of any city and its architecture. An excellent illustration of the truth of this principle is afforded by the magnificent municipal buildings which have been erected all over the country during the last thirty years, a period which has also witnessed an enormous development in municipal life and activity. The improvement of the architecture and planning of a great city are not only worth while on account of their intrinsic value, but also on account of the effect which they have on commercial life. As Mr. Newton said, money which is spent upon well-planned streets and fine buildings is well invested. Our business firms already recognise this. The magnificent and costly premises erected for our big banking and shipping corporations, the luxurious establishments of our great retail houses are witnesses to the value of appearances, the impression produced on the public by a display of solidarity and wealth and the attractiveness of handsome surroundings. It is well that this commercial aspect of municipal improvements should be borne in mind if only for the reason that the cash argument is the only one which appeals to certain minds in connection with improvements that are primarily required in the interests of public health.

A Tramcar Accident.

In connection with the accident which occurred a short time ago on the Wigan Corporation narrow-gauge tramways an inquest was held last week, and in the course of the inquiry some interesting theories were advanced as to the cause of the accident. Mr. Frank Buckley, the general manager of the corporation tramways, stated that the car was fitted with three brakes—the ordinary hand-brake, a slipper-brake, and an electric brake—and that it had been overhauled the previous day. He further pointed out that after the accident the car ran on the lines and through all the points to the depot without any trouble. The driver of the car advanced the theory that the front wheels jumped the metals at the points, and ran off the lines from the points to a crossing, the back wheels keeping on the track all the time. Upon the car reaching the crossing it tended to turn across the road, and so overturned. Mr. Buckley pointed out, however, that if this theory were correct, and the wheels took the wrong road, any projection getting into the points would stop the point tongue going back into the socket. Apart from some foreign substance getting into the rail, there was, he thought, nothing to account for the car leaving the rails. A juryman asked whether the line would not have been safer either with a broad gauge or with a one-deck car, and in reply it was pointed out that the present system had been approved by the Board of Trade, and so must be presumed to be safe. It was further stated that this was the first car that had overturned in twenty years. The coroner said he had no hesitation in advising the jury that there was no evidence of any criminal neglect, and a verdict of accidental death was returned, the foreman stating that the jury "do not hold anybody responsible for any negligence in any shape or form."

* * *

Appointments During War Time.

We have already drawn attention to the desirability of local authorities as far as possible only filling temporarily appointments in their offices which may fall vacant during the war. The reason for this is two-fold. In the first place, a local authority can hardly expect to get applications in present circumstances from many of the best possible candidates, who are serving their country in the field, and in the second place, if lucrative appointments are now filled, those who have given up so much for the sake of their country will be handicapped and possibly their whole careers affected by being precluded from applying for such appointments. But even while holding these views, we are quite at a loss to understand the attitude of a certain Mr. Bramham, a member of the Wath-upon-Dearne Urban District Council, who objected to the appointment, even temporarily, of the assistant surveyor as surveyor and waterworks engineer, although that gentleman is already in the service of the council and has several times been rejected as unfit for military service. It is satisfactory to observe that Mr. Bramham found himself in a minority of one.

Assistant County Surveyors' Petrol Allowance.—Assistant county surveyors who ride motor-cycles will have their claims for additional petrol considered by the Board of Trade.

Diesel Oil Engines.*

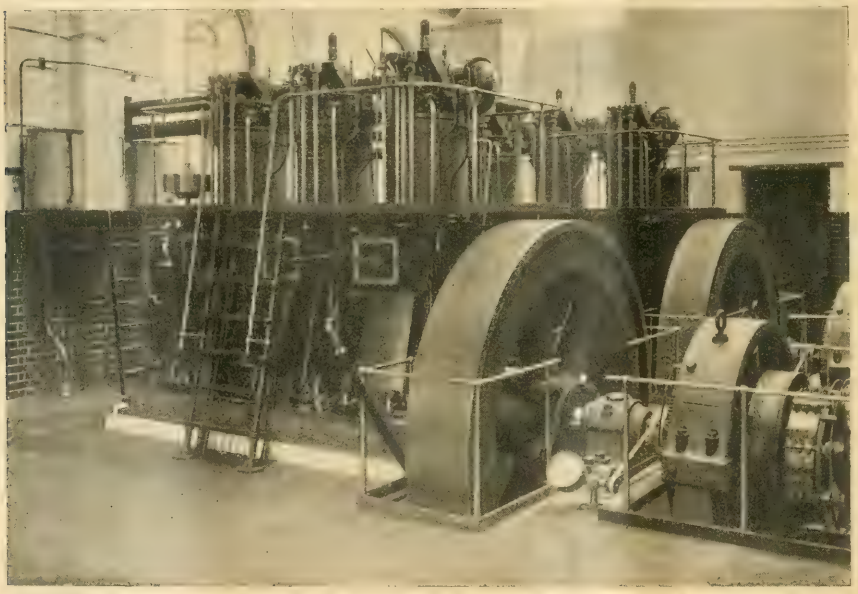
By F. REGINALD PHIPPS, Assoc.M.Inst.C.E., F.S.I., Borough Engineer of Basingstoke.

The use of Diesel engines has of late years come prominently to the front for electric light works, sewage and water pumping, and the author hopes that an account of their use may be welcome and instructive.

Having been instructed by his council to carry out an electric lighting scheme for the town, the question of the most suitable prime mover to be used was one of the most important points to be decided.

The merits of steam, oil and gas engines were carefully considered. Gas engines worked by town gas were, of course, ruled out at once by the high running costs; allowing a consumption of only 20 cub. ft. of town gas per b.h.p. hour, the cost at the local price of 3s. 1½d. per 1,000 cub. ft. would be ·75d. per b.h.p. hour. If producer gas is used, as in some towns, the economy becomes more marked, open to conjecture; but it is apparent that even at 82s. per ton the economy in power production is most marked.

The use of suction-gas engines, however, is limited by other reasons than the question of economy; some of these are—the difficulties of direct driving, and the unsatisfactory nature of belt driving; the tarnishing of electrical instruments and other brass work from the gas fumes; the difficulty of disposal of scrubber water, and the appreciable time required in blowing up the gas before starting. In addition, it is difficult to run on a light load for any considerable period, owing to the cooling of the fuel in the producer; also, should a heavy load be applied suddenly, the speed of the engine tends to drop, as the fuel cannot be made incandescent quickly enough to supply the necessary gas.



Diesel Oil Engines at Basingstoke.

and nearly approaches that of Diesel oil engines. Thus in the waterworks which are worked by suction gas the average yearly cost per pump horse-power hour, with anthracite averaging 30s. per ton, has continued to be about ·25d.

With the Diesel engines, which were decided upon and eventually installed, the cost of fuel per kilowatt-hour, with oil at 82s. per ton, is about ·30d., equivalent to a price per horse-power-hour of actual work of ·22d.

Even allowing for a higher efficiency of engine and dynamo over that of engine and pumps, the advantage in economy is with the oil engine.

Comparison of Cost of Fuel.

When considering these costs the price of fuel must be taken into consideration. Anthracite delivered at the station has varied in the last eight years between 26s. and 32s. per ton, while oil fuel has undergone greater fluctuations. Oil three years ago could be obtained at about 45s. per ton at station; our present contract price to August, 1916, is 82s. per ton, while the high price of 146s. 6d. has had to be paid to secure a contract for delivery in 1917. This is subject to a reduction of 50s. per ton six months after the declaration of peace.

This price is bound to drop considerably after the war, but whether it will ever reach its old low level is

As regards steam, its great advantage is its reliability, but unless large units are being installed, so that superheated steam and turbines can be used, the fuel costs are high in comparison with the Diesel.

For a medium-sized engine, say up to about 150-b.h.p., the consumption of good steam coal per p.h.p.-hour under actual working conditions of electricity supply would not be less than 2½ lb. Such coal now costs here 26s. 6d. per ton at railway, which gives a cost of ·35d. per p.h.p.-hour, or an equivalent of ·47d. per kilowatt-hour.

Beyond the question of fuel costs, the capital expenditure must be considered. With a Diesel engine a considerable saving is made in the cost of buildings by the fact that no boiler-house, chimney shaft or economiser is required. In addition, a large quantity of water is not required for feed and condensing purposes, though a certain amount is required for jacket circulation.

Cost of Machinery.

As regards the capital cost of the machinery, it can generally be taken that the Diesel engine will cost as much as the steam engine and the necessary boiler.

The cost of two 150-b.h.p. Diesel engines, and all requisite accessories, erected in 1914, was £2,762; the water cooler for dealing with 36 gallons per minute was £195, and the softener, of 200 gallons per hour-size, was £63.

* Paper submitted at the recent annual meeting of the Institution of Municipal and County Engineers at Blackpool.

The cost of these engines was very low, and the cost of an exactly similar engine which was added in April, 1915, was £1,739.

After carefully weighing up all the various points, the author decided to recommend the adoption of Diesel engines, and two sets of 150-b.h.p. each, coupled to direct-current dynamos of 100 kilowatts, were installed.

The following fuel guarantees were given with the tender, and have been easily fulfilled on the test and in actual working:—

Full load	·44 lb.	per b.h.p. hour	·68 lb.	per kw. hour.
¾	,, ·47	,,	·70	,, ,,
½	,, ·54	,,	·83	,, ,,
¼	,, ·70	,,	1·18	,, ,,

The engine was also guaranteed to run satisfactorily on an overload of 10 per cent. for two hours.

Before describing the practical points in connection with Diesel engines, the general theoretical principles involved may be considered.

THEORETICAL PRINCIPLES.

The economical working of the Diesel engine is due to the fact that the heat value of the fuel is utilised to a greater extent than in any other prime mover.

Thus the Diesel engines consume per b.h.p.-hour about 7,500 b.t.u.

Gas engines consume per b.h.p.-hour about 9,000 to 12,000 b.t.u.

Steam engines consume per b.h.p.-hour about 16,000 to 28,000 b.t.u.

This high efficiency is due in the first place theoretically to the fact that the range between the high temperature of the ignited fuel and the low temperature of the exhaust is very great.

The efficiency formula for the Carnot perfect engine cycle is—

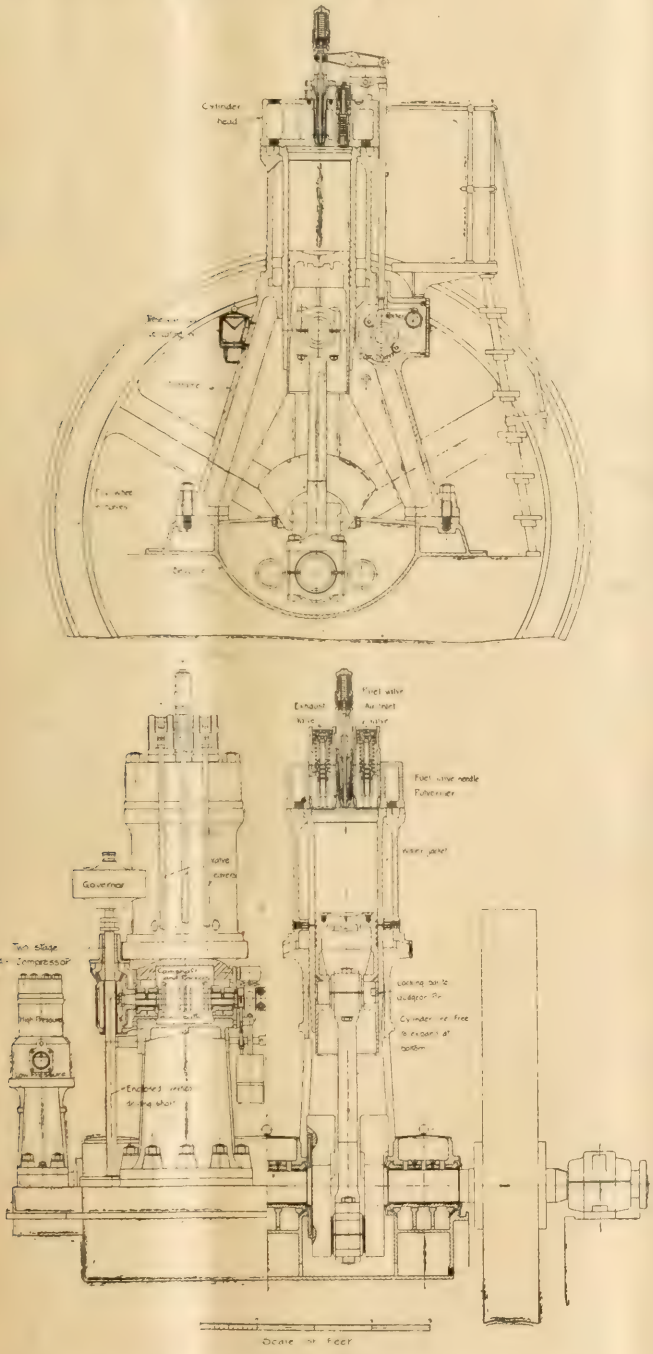
$$\frac{\text{work done}}{\text{heat expanded}} \qquad \frac{T_1 - T_2}{T_1}$$

T_1 being the initial absolute temperature of the gas, and T_2 being the final absolute temperature of the gas.

Practically, also, the Diesel works with such high compression that the clearance space is very small, so that there is very little surface for cooling the gases when they are at their highest temperature—*i.e.*, on ignition of the fuel.

There are no losses from boiler or producer plant, and less loss in cooling or condensing water; also fuel is only being consumed during actual running, there being no standby losses as in steam or producer gas. In addition, any class of liquid fuel can be used, from petroleum to tar oils; that generally in use is the thick heavy residual oil which is left after the lighter oils—petrol and petroleum—have been distilled off from the original crude oil. This fuel oil has a specific gravity of about ·92-·95, and a heat value of about 18,000 b.t.u. per lb. It has a high-flash point of about 200 deg. Fahr., so that there is little risk of fire in storage or use.

Owing to the present high price of fuel oil, the use of tar oils is likely to come prominently forward in the near future. These tar oils are the heavy oils (creosote and anthracene) which are obtained in the fractionation of coal tar after the lighter oils



Diesel Oil Engines: Section of Single Line Set of 50-h.p.

(benzol, phenol, &c.) have been distilled off. They are also a by-product from coke ovens, which it is becoming increasingly remunerative to recover. The specific gravity is from 1·0 to 1·10, and the heat value is about 15,800 b.t.u. per lb. They cannot, however, except at high loads, be used without an auxiliary, which takes the form of a pump which delivers a very small quantity of easily burning oil, such as paraffin, into the cylinder to start the ignition of the tar oil. More frequent attention to the valves is also required, as they are more liable to clog and stick up than if a cleaner fuel oil were used.

The outstanding and distinguishing feature of the Diesel engine is that ignition is not obtained by any external agency, such as sparking plugs, lamps, &c., but by high compression generating sufficient heat to ignite the fuel mixture. The majority of Diesel engines in this country, and especially the smaller sizes, are single acting and of the four-cycle type, the sequence of which is shown in Fig. 1.

On the first and outgoing stroke of the piston air is drawn into the cylinder through the air valve.

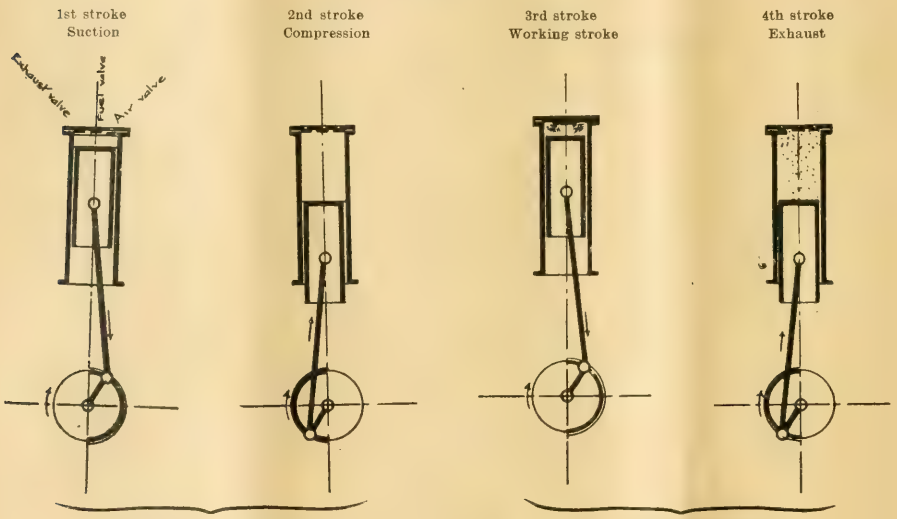


Fig. 1.

On the second and return stroke all valves are closed and the air within the cylinder is highly compressed, usually to about 450 to 500 lb. per square inch, with an accompanying increase of temperature to about 1,000 deg. Fahr. On the third stroke the fuel valve opens, and the fuel which has been accumulated in the passages of the fuel valve is blown through a pulveriser into the cylinder by compressed air, stored at a pressure greater than that in the cylinder. This process mixes the injection air and the oil intimately, so that when it reaches the cylinder it is in the form of a spray. Directly this spray enters into the highly compressed and heated air it automatically burns, increasing in volume and driving the piston down. This, therefore, constitutes the power stroke of the cycle. It will be seen that no explosion takes place in the true sense of the word, and this type of oil engine therefore works much more quietly than any other type of internal combustion engine. On the fourth stroke the burnt gases are exhausted into the atmosphere, and the cycle is then repeated.

The corresponding indicator diagram is shown in Fig. 2.

In this cycle there are, of course, two revolutions of the crankshaft for one working stroke.

In the two-cycle type of engine there is only one revolution for each working stroke. This is shown in Fig. 3, from which it will be seen that the exhaust is taken through ports in the body of the cylinder, and not in the head. A special scavenging pump is also required for the removal of the exhaust gases, and for filling the cylinder with fresh air. On the first portion of the ingoing stroke of the piston the exhaust gases are scavenged out of the cylinder and replaced with fresh air; on the second portion of the same stroke the air is compressed. At the commencement of the second stroke the fuel oil is injected and ignited, thus constituting the working stroke; near the end of this second stroke the exhaust gases are allowed to escape, and then a fresh cycle commences.

The indicator diagram, Fig. 4, is similar to the preceding one, except for the sudden drop of pressure near the end of the working stroke.

PRACTICAL CONSIDERATIONS.

In the author's opinion two of the most important points to be borne in mind in choosing a Diesel engine are to obtain as low a speed and as low a mean effective pressure (m.e.p.) as possible. The cylinder heads and pistons are subjected to such great pressures and temperatures that any reduction of these, while still obtaining the same power, is most beneficial. The continual heating and cooling induces fatigue of the metal, and the more rapid

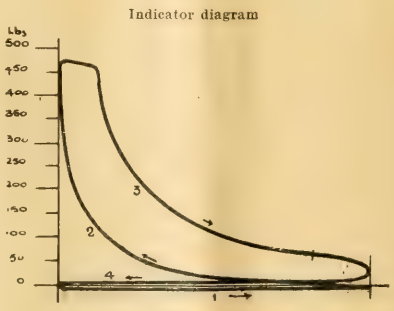

Fig. 2.

these alternations are the quicker the fatigue. A slow speed is therefore of great value in reducing the trouble often met with in high-speed oil engines of cracked heads and pistons.

The m.e.p. is obtained as follows, the actual dimensions of the engines installed being taken:—

A mechanical efficiency of 75 per cent is usually assumed; therefore a b.h.p. of 50 is equivalent to an i.h.p. of 66⅔

Diameter of cylinder 13 in.

Area of piston 132·73 sq. in.

Stroke 20 in.

Number of revolutions per minute 210.

Then $\frac{\text{PLAN}}{2} = 66\frac{2}{3}$

Therefore $\frac{P \times 1{\cdot}66 \times 132{\cdot}73 \times 210}{2 \times 33{,}000} = 66\frac{2}{3}$

Therefore P = $94\frac{1}{2}$ lb. per sq. in. = M.E.P.

The largest maker of Diesels on the Continent quoted for an engine of this size, having a speed of 195 r.p.m., with an m.e.p. of 96·1, while that quoted by probably the largest maker in England had a speed of 250 r.p.m., with a m.e.p. of 102½.

A further point requiring attention when installing Diesels is that great care is necessary in providing a sufficiently firm and massive foundation for the engine, so as to prevent trouble from vibration. A peculiarity of this vibration seems to be that it is not very noticeable in the engine-house itself, but is more pronounced some distance away. Trouble has arisen in various towns from this cause, and an injunction has been obtained against a neighbouring council at the instance of an aggrieved householder living near a Diesel engine station.

tion obtained by drawing air from inside the engine-house might be an advantage.

In actual running special care is required to see that the lubrication of all parts is adequate. Failure in this direction has been the cause in many cases of melting of the white metal of the bottom bearings, and in some cases this has been followed by fracture of the crankshaft—an expensive item to replace.

Other results often due to faulty lubrication are seized and cracked pistons, though the latter more often is caused by running the engine for long periods on overload and at high speeds. Many engineers on this account hesitate to put their engines for long runs on more than 90 per cent of their rated capacity, and if this is necessary it should be taken into account in the comparison of capital costs.

ARRANGEMENT OF ENGINES.

The general arrangement of Diesel engines is that of having one, two, three or four cylinders in a line, the power of these cylinders varying as desired. Few English makers go beyond 125 h.p. per cylinder, and

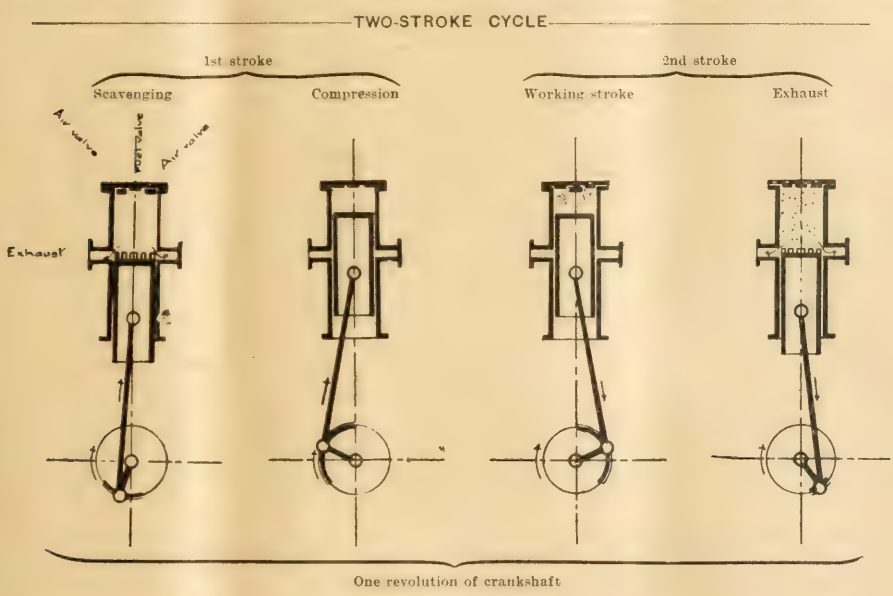

FIG. 3.

In the majority of stations nothing more appears to be done than to provide a massive foundation of rich concrete carried down on to a solid bearing. In one or two instances a cushion of a few inches of sand has been interposed between the base of the concrete and the substratum. A space has also in some cases been left round the sides and ends of the concrete so that no vibration should be transmitted to the adjoining earth. Several patent methods of combating this trouble are also in vogue, comprising chiefly the use of cork layers to surround the foundation concrete.

In the author's case a plain 5 to 1 concrete foundation was used, carried down to a depth of 7 ft. on to a solid chalk foundation, and no trouble has yet been experienced.

Nuisance is also occasionally caused by noise and fumes from the exhaust, and noise from the air-inlet pipe. A quiet exhaust can, however, generally be obtained by providing an underground baffle pit, from the end of which the vertical exhaust pipe is carried up to the roof of the building, and capped with a cast-iron silencer. A smoky exhaust should never occur if the valves are in correct adjustment, except possibly for a few moments at starting.

The air inlet pipe requires silencing, and this is usually done by closing the end of the pipe, and providing a series of long, narrow slits in lieu of the open end. If the air-inlet pipe is carried outside into the open, a quieter engine-house is the result, and the air obtained is certainly no less suitable for combustion purposes than that inside. On the other hand, in a confined engine-house the ventila-

Indicator diagram

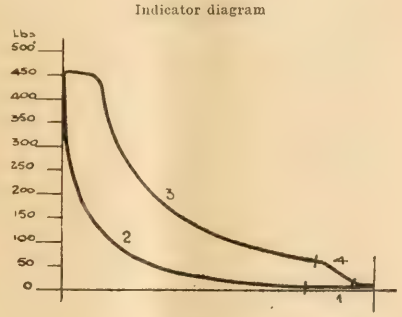

FIG. 4.

the Basingstoke set, which was manufactured by Messrs. Cole, Marchent & Morley, of Bradford, is a three-line set of 50 b.h.p. each. Sections of a one-line set are shown.

The cylinders are carried in the usual "A" frame, which is in its turn bolted on to the bed-plate; the latter is secured by 2-in. holding-down bolts, going 5 ft. down into the concrete foundation, finishing with 9-in. plates, the whole as usual being grouted up with cement.

On top of the cylinders are bolted the cylinder heads, on which are fitted the fuel valve in the centre,

with the starting valve in front, and the exhaust and air inlet valves on either side. These valves are actuated by three outside levers, worked from a camshaft supported on the "A" frame; in most cases the valves are driven direct from the camshaft without the intervention of levers, but it is claimed that the former has an advantage by simplifying the casting of the cylinder heads and "A" frames in doing away with the projections to carry the camshaft bearings; also that the starting gear can be more easily operated from the ground, and again that it makes it possible to enclose the whole of the cams and rollers in an oil bath, so reducing wear and noise.

The camshaft is operated from the crankshaft by a vertical driving shaft, fitted with skew and bevel gearing. The same shaft also drives the governor, which controls the speed of the engine in a very sensitive manner. Each cylinder has its own fuel pump driven by an eccentric from the camshaft, and the governor acts by limiting the amount of fuel oil delivered by this pump. It does this by controlling the suction valve. When the speed increases, a tappet underneath the valve is lifted by the governor, the period of lift varying with the speed. Thus, with a full load and normal speed, the tappet does not touch the suction valve, but if the load is lightened and the speed automatically goes up, the suction valve is proportionately held up during part or the whole of the suction and delivery strokes, thus limiting the amount of fuel oil reaching the cylinder.

The fuel pump is also provided with a by-pass, which allows the pipes to the fuel valve to be charged with fuel by means of a hand pump, so as to facilitate starting up.

The camshaft also operates a lubricating pump, which forces the oil round the cylinder walls, and also to the gudgeon pin of the piston. This oil is supplied by drip feed from an oil reservoir bolted on to the standards, another drop from the same reservoir going direct to the centrifugal oiler bolted on to the crank for lubricating the big ends of the connecting rod. The main and camshaft bearings are ring-oiled, and fitted with inspection covers for maintaining the proper oil level.

The air compressor is driven off the extreme end of the crankshaft, and supplies air to the starting and running cylinders or bottles. It is of the two-stage type, the bottom low-pressure piston compressing up to a maximum of 100 lb. per square inch, and the top high-pressure piston raising this to the blast pressure required, a maximum of about 750 lb. The compressor is water-cooled in the usual way.

The compressor delivers to two large bottles, the air from which is used for starting up the engine, and also to one small bottle for supplying the air for blowing in the fuel oil. The bottles are usually of welded steel, and are tested to 2,000 lb. per square inch. Three pressure gauges are provided, giving the pressures in the intercooler, the starting bottles, and the running bottle.

After the engine has been started up, the throttle valve on the low-pressure side is opened fully, so as to restore the full pressure to the starting bottles, and it is then adjusted to maintain the correct pressure in the running bottle.

The fly-wheel is of massive proportions, being 8 ft. 6 in. diameter and 7½ tons in weight, and is in halves. It ensures very steady running, the cyclical variation being 1/150.

The fuel oil is stored in a large cylindrical iron shell outside, holding about 23 tons. It is pumped thence by hand to the daily service tank in the engine-house, holding 200 gallons, and gravitates from this to the filter tank, which strains out any thick matter which would clog the pipes.

A second filter tank is also provided for the storage of gas oil or paraffin, and the engine is run from this for starting up, and for about five minutes before shutting down, in order to leave the valves, &c., in a cleaner condition. A three-way cock allows either oil to be used as required. The oil gravitates to the fuel pump, and thence is delivered to the fuel valve, situate on the top and in the centre of the cylinder cover. Inside the fuel valve is a pulveriser, which consists of several brass plates with small holes through which the oil is forced, thus dividing it into a fine spray. This spray of oil is forced into the cylinder by the blast of compressed air from the running bottle.

The amount of compression in the cylinder at the moment the fuel is injected is constant, and generally averages about 450 lb. per square inch, but this can be varied to suit the particular type of oil used. The running-bottle pressure varies according to the load from 550 lb. to 750 lb. per square inch.

COOLING.

A water-jacket having a 2-in. water space surrounds the cylinders, and the flow of water should be sufficient to keep the temperature of the outlet water below 140 deg. Fahr.

It is essential that the jacket space should be kept free from scale or deposit, and the circulating water must therefore be soft and clean. The town water is used in this case, and as the hardness is 15 deg., of which 11 deg. are temporary, it is softened before use. If the cooling water is supplied at a temperature of 60 deg. Fahr., and the outlet does not exceed 140 deg. Fahr., about 6 gallons per b.h.p. hour are required. Unless, therefore, suitable water can be obtained from a canal or stream, the cost of the circulating water would be a considerable item. To reduce this, a Heenan & Froude's cooler has been installed, by which the actual amount of water wasted is reduced to 2½ per cent of the above figure; the actual amount of water required for the generation of 200,000 units was 39,000 gallons; the cooler is compact and economical, and can deal with 36 gallons per minute.

The gearing and pump are actuated by a 5-h.p. motor, and 3 units an hour are used with both engines running. At "works cost" price the current used costs 3d. per hour.

The cooler comprises a circular drum containing galvanised steel sheeting wound in a spiral, which dips for about a third of its depth into a receiver, and is revolved through gearing from the motor. The exhaust water gravitates to the receiver, and is picked up by the slowly revolving plates. A current of air is drawn through these plates by means of a fan, and the resultant evaporation of the thin film of water picked up produces a considerable cooling action by the abstraction of the necessary latent heat from the plates, in addition to the cooling due to the contact of the air and water. The cooled water is taken from the other end of the receiver and is lifted to an overhead storage tank by a centrifugal pump. This water is then ready once more to circulate through the water-jackets. The only make-up water, therefore, required is to replace that evaporated, and only this small quantity requires softening.

Dealing as we are with comparatively high speed and considerable pressures, the liability to accidents is probably greater than with steam, but, given a well-designed Diesel of adequate strength to withstand the stresses set up, these accidents should be few and not of serious character. The economy in fuel is undoubted, and ought to outweigh the attendant disadvantages.

COST OF WORKING.

The works since completion in October, 1914, have been under the able management of Mr. George Broadhurst, A.M.I.E.E., who, having previously acted as clerk of works during construction, was appointed electrical engineer, and so successful have they been that a third engine of similar size, and from the same makers, had to be put down last summer.

The financial results have also been most satisfactory, the following being the figures for the year ending March 31, 1916:—

Earnings		£3,212
Expenditure—Working costs ...	£1,725	
Loan charges ...	1,162	
		2,887
Net profit		£325

Units sold, 406,465. Load factor, 22·4 per cent.

Total costs per unit *sold*.

Working costs—Fuel oil	·33d.
Oil, waste, water and stores	·05d.
Wages	·18d.
Repairs and maintenance ...	·14d.
Rates and taxes	·04d.
Management, salaries, insurance, &c.	·27d.
	1·01d.
Loan charges, interest and redemption ...	·68d.
Total cost ...	1·69d.

It is very rarely that a small town can show a nett profit in the first year of an electrical undertaking, and this fact and the lowness of the working costs per unit sold are a great testimony to the efficiency of the Diesel engine. The attention of municipal engineers might usefully be turned more closely to this source of power in the future when considering the installation of water and sewage pumping machinery.

Surveyors: Their Security of Tenure and Defence—(2).*

By J. H. DREW, M.Inst.C.E.I., Borough Surveyor of Grantham.

Members are told from time to time that in regard to security of tenure and superannuation, the council of the institution are in close co-operation and consultation with the National Association of Local Government Officers, who have the same objects in view. The council, the author believes, fully realise how necessary it is to take any opportunity towards obtaining security of tenure for the members, who have often very difficult and trying positions to fill. The author fully appreciates the work being done by the National Association of Local Government Officers, but is it not a case for considerably more self-effort? Does not the duty of helping one's self in the highest sense involve the helping of one's neighbour?

Union is strength, and if the majority of the members would band together in some scheme, or join the excellent association founded by Official Security, Limited, to insure themselves against loss of office, and for the purpose of defence against libellous, slanderous or other illegal attacks, it would no doubt help any deputation to prove to the Local Government Board that they were helping themselves to defend their positions, although, having to administer the laws and regulations issued by the State, they nevertheless consider the necessary protection in our offices should be provided impartially.

Although up to the present the results achieved have been *nil*, three Presidents of the Local Government Board have been petitioned and interviewed upon this question of security of tenure first at the initiation of the institution in 1872, again in 1884, and lastly in February, 1914, when Mr. John Burns held office.

It will be observed that a period of thirty years elapsed between the second and third deputations, but one hopes that a recent prediction in one of the leading technical journals to the effect that surveyors are likely to be still clamouring twenty-five years hence for protection will prove very wide of the mark, and that long before then their efforts will be rewarded by success.

Mr. Herbert Samuel, when President of the Local Government Board in 1915, was the first president to concede the principle of security of tenure to whole-time medical officers of health and inspectors of nuisances, and in that decision the present president, Mr. Walter Long, in a letter to Sir Philip Magnus, M.P., on December 30, 1915, stated that he entirely agreed with the decision at which Mr. Samuel arrived and that he was strongly in favour of security of tenure for these officers.

As members are aware, an order has now been prepared to give security of tenure to whole-time medical officers of health and inspectors of nuisances, but the steps towards this were well ahead before war broke out, although the issue of the order has, unfortunately, had to be postponed until the conclusion of the war.

The author appeals to the council, particularly on behalf of the surveyors to smaller districts, to take the first favourable opportunity again to interview the Local Government Board and press the case for security of tenure, and if possible to obtain the inclusion of surveyors in the order dealing with the appointments of the health officers previously mentioned. The author appreciates that the great congestion of work at the Local Government Board and the preoccupation of the president and his chief officials with problems connected with the war will not permit of a petition being presented until the return of normal times and peace has been declared.

POSITION REMAINS AS IN 1872.

The fact must be faced. The position of surveyors appointed under the Public Health Act, 1875, in regard to security of tenure is to-day exactly as it was in 1872, or forty-four years ago. What is the cause? Is it inertia on the part of surveyors themselves? The author rather thinks that has been a great factor in the non-success of previous efforts. What has been achieved for medical officers of health and inspectors of nuisances should not be beyond achievement by surveyors. For a period of thirty years between 1884 and 1914 no official deputation from the Institution of Municipal and County Engineers waited upon the Local Government Board to put forward claims for security of tenure.

SECURITY OF TENURE AND QUALIFICATIONS OF SURVEYORS IN IRELAND AND AUSTRALIA.

Mr. P. C. Cowan, D.Sc., M.Inst.C.E. (honorary member of the Institution of Municipal and County Engineers), the chief engineering inspector of the Local Government Board of Ireland, in an extremely able and thoughtful address to a conference of engineers and surveyors at the Royal Sanitary Institute Congress at Belfast in July, 1911, pointed out that in some respects the law in force in Ireland is more favourable to engineers and surveyors than the corresponding statutes in England and Wales. County surveyors, assistant county surveyors, and practically all town surveyors, as well as sanitary officers, have security of tenure in Ireland, and can only be removed from office with the consent of the Local Government Board of Ireland, which is a separate department from the Local Government Board in England.

Mr. Cowan stated that, in his opinion, this provision has proved very beneficial, and though now and then a tactless officer may presume too far on the protection the law affords him, the control of the authorities over their servants is not unduly affected.

Sec. 27 of the Labourers (Ireland) Act, 1906, enacts as follows: "Every person whom a district council propose to employ as architect, engineer, surveyor, or clerk of works, for the purpose of the Labourers Acts, shall satisfy the Local Government Board that he has sufficient knowledge and experience for such employment."

It can truthfully be said that the thin end of the wedge has been inserted by the provisions of this Act to the securing of only properly qualified persons for such appointments.

The Act further empowered the Local Government Board to make rules and regulations, and a General Order of 1906 states: The following persons shall be deemed eligible for employment as architect, engineer, or surveyor:—

(*a*) Fellows, members, associate members, or professional associates of any recognised professional association or institution of architects or civil engineers, who have been in practice for at least two years.

(*b*) County surveyors.

(*c*) Persons who have a diploma or degree in engineering from a university or college of science in the United Kingdom, and have had two years' experience on works.

(*d*) Assistant county surveyors who are certified by a county surveyor to be possessed of a sound knowledge of building construction.

(*e*) Persons who have been trained for not less than four years in the office of an architect or civil engineer, in good practice, and have had responsible care of works of importance.

(*f*) Persons who by examination, or the production of testimonials or other evidence, can satisfy the board that they have sufficient knowledge and experience for such employment.

Recently the Local Government Minister of the Commonwealth of Australia has assented to a proposition that municipalities having a revenue of not less than £10,000, and that of shires having revenues of not less than £5,000, shall be compelled to employ duly qualified engineers.

The author submits that in the precedents established in Ireland and Australia is the nucleus upon which the Institution of Municipal and County Engineers, in conjunction with other recognised professional associations or institutions if necessary, should again approach the Local Government Board or Parliament, in an earnest endeavour to obtain security of tenure, and the future appointment to the position of engineer or surveyor of persons possessing at least such minimum qualifications as may be prescribed by the Local Government Board in a General Order.

APPOINTMENT OF COMMITTEE SUGGESTED.

The author may perhaps be excused in his zeal

*From a paper submitted at the annual meeting of the Institution of Municipal and County Engineers.

if he suggests to the council of the institution the immediate formation, from among the members of the council (or any other member whom the council may decide to co-opt), of a strong committee to deal specially with security of tenure and the consideration of a scheme to submit to the Local Government Board dealing with the problem in a satisfactory manner to all concerned. The author may be told that such a course has been adopted, but if so, the censor must have prevented the proceedings becoming known to the majority of our members. This committee could put the case before the Local Government Board, and at the same time collaborate with the National Association of Local Government Officers or any other institution or institutions having the same objects in view.

Once security of tenure becomes an accomplished fact, there is no reason to doubt that superannuation will, in due course, quickly follow. Without security of tenure, superannuation, in the opinion of the author, is of little moment.

(To be concluded.)

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

APPLICATIONS FOR LOANS.

Batley T.C.—£25,000 for the extension of the gas-works.

Cumberland C.C.—£1,200 in respect of the rebuilding of Esk Bridge.

Leyland U.D.C.—£6,900 for a new water main.

LOANS SANCTIONED.

Battersea B.C.—£3,728 for electric supply purposes.

Royton U.D.C.—£8,729 for sewerage works at High Crompton.

Crompton U.D.C.—£8,729 for sewerage works at High Crompton.

Derby T.C.—£9,000 for electric mains and motors.

Loughborough T.C.—£700 for electric cable extension.

Newhaven R.D.C.—£4,050 towards the cost of the Newhaven to Seaford road scheme.

Stafford T.C.—£6,280 for the provision of a 500-kw. turbo-generator.

FORTHCOMING INQUIRIES.

A Useful Book for Road Engineers.—There is, we understand, a large and increasing demand for the late Mr. John Hutchinson's excellent little work, "The Testing of Tars and Pitches for Roads: A Practical Guide for Engineers and Surveyors." The price of the book is 1s. 7d., post free.

Wood Blocks at War Prices.—On Monday, of four tenders received by Hampton Wick Urban District Council for the supply of 5,000 wood blocks, the lowest, that of Sir W. Burnett & Co., Millwall, at £15 12s. 6d. per thousand, was accepted. Under the previous order the price was only £10 4s. 6d. per thousand.

Decimal Coinage and Metric System.—The President of the Board of Trade was asked in the House of Commons whether the introduction of decimal coinage and the metric system was under the contemplation of the board; and whether in view of the advantage to the internal and external trade of the country, he would consider the appointment of a committee to inquire into the matter and make recommendations. In reply, Mr. Harcourt pointed out that the use of the metric system of weights and measures had been lawful since the passing of the Weights and Measures (Metric System) Act, 1897. Its compulsory use was not under contemplation by the Board of Trade, and he doubted the desirability of appointing a committee with special reference to the question. The introduction of a system of decimal coinage was primarily a matter for the Treasury.

SURVEYORS' PETROL ALLOWANCES.

To the Editor of The Surveyor.

Sir,—I was much interested in the Minute on "Surveyors and Petrol" in your issue of 28th ult. I quite expected to find in your last issue a great many complaints from other afflicted souls, and am much surprised that no one "has lifted up his voice." Here is my tale of woe: I am surveyor (unassisted) of a district the area of which is 359 square miles, and my annual mileage on duty for several years back averages 6,000. Several of my journeys "out" exceed 20 miles, while one is actually 35 from my office, and to discharge duties which involve 6,000 miles travelling per annum I am allowed 2 gallons per week (I asked for 18 gallons per month, instead of 25), which at 20 miles to the gallon gives 2,080 in the year. If I make any journey exceeding 20 miles "out" I cannot complete the return run on a week's supply, and when, as I frequently have, and must continue to do, make the 35-mile run "out," my week's supply is exhausted before I am 6 miles on the way homeward. There is no railway in my district, and no other means of travel by which my duties can be efficiently carried out. I am working with a much depleted staff, part of it engaged on work for which Government grants have been received. I am asked to exercise the most rigid economy, which means increased supervision, and all this is to be done on 2 gallons per week. How is it to be done? Who is responsible for this muddle? Who is to help to straighten out the tangle? (I should like to make it clear that the muddle will pay me, as my travelling allowance, small as it is, will be paid in full, whether I complete my 6,000 miles this year or not. I mention this to show that the petrol is not for "joy riding," and that the less I have to pay for the less I will have to pay out for petrol from my allowance.)

Now for the other side. We all know the story of the transport man who washes his car in petrol, and of the airman who always pours out whatever remains in the can rather than carry it back a few yards to the store—both perfectly true, I believe—and also the other of the engines left running at the door of the "White Hart" for several hours while the drivers slake their thirsts within. Leave these out of count. I take only those round me here. Every pleasure car I know of has got a vastly greater supply than has been allocated to me, while one enterprising gentleman who has never had a car has applied for and been granted a licence for a very ample quantity which he may use in the car he has been "talking" of purchasing for the last six years, and which, when, if ever it does arrive, will be used solely for pleasure. To crown it all, though this wonderful committee have got my money I have not yet got my licence. At this very moment I ought to be far from home, but my tank is dry and I can neither beg, borrow, nor steal the precious spirit. Meantime we may have another cloudburst and have all traffic dislocated, and I can do nothing to carry out the necessary repairs. Cloudbursts have been rather frequent of late.—Yours, &c.,

A County Road Surveyor.

August 7, 1916.

The Building Restrictions.—The Ministry of Munitions calls attention to the Order in Council issued on July 20th, which makes it necessary for a licence to be procured for works of construction of various kinds to be proceeded with or commenced. Provided that a licence has been applied for, any building which was actually in progress before July 20th may be continued until a licence has either been granted or refused. Therefore it is not necessary to stop work while the granting of a licence is being considered.

Manchester Corporation and Enlisted Men.—A conference of Manchester Corporation committees and departmental managers has agreed that each department should do its best to find work for returned soldiers. In cases where the men are fit and in good health the places they left for the war will be restored to them without question; for men who have been disabled in any way the departments will find suitable work, and Manchester men, on discharge from the Army, will have preference over all others for any vacant places under the corporation.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Were the Westminster City Council justified in withdrawing their support of the Metropolitan Paving Committee, and has the work of this committee been sufficiently useful to warrant the expenditure of £100 a year in obtaining the reports and statistics which have been annually published? Will the eight out of the nine Metropolitan "paving authorities" which have hitherto supported this committee carry on the work without the aid of Westminster, or will the committee feel that their past useful work may now come to an end, especially during the altered conditions due to the war?

* * * *

Is it a fact that a company has been formed to manufacture sanitary pipes and paving flags out of molten lava, as it issues from a certain volcano "somewhere abroad," at a temperature of about 1,500 deg. Fahr.? Have we not heard that a certain hot locality is paved with good intentions, and, if this is so, should not the proposal go one better than good intentions and produce a really first-class paving?

* * * *

Is it a fact that a German society, called the "Friends of Cremation," has lately been founded, and that they have made representations to their Government with a view to the systematic and wholesale cremation of corpses in the battlefields? Will the complete adoption of such a system for soldiers assist the general movement of cremation on sanitary and other grounds, or will the suggestion appear to be repellent to the friends or relatives of men who have died for their country—whether that country was in the wrong or not?

* * * *

Was not the paper submitted to the annual meeting at Blackpool by Mr. W. H. Schofield, the county surveyor of Lancashire, prophetic of the vastly increased and altered character of the traffic which our roads will have to bear in the near future? Is it not evident that manufacturers and others will make less and less use of the railways for conveyance of their goods and resort more and more to conveyance by road? As this becomes evident will it not be necessary to build up certain roads to withstand this traffic, and will not the best granite setts laid on a reinforced-concrete foundation, be the road of the future in and near our large industrial centres? What other description of road is going to stand the traffic without constant and costly repairs?

* * * *

Where would our railroads have been now if the railway directors and their engineers had not foreseen the growth of the weights and speeds which the rails were destined to carry, and what is going to happen if our local authorities and their surveyors do not realise what is in store for the highway of the future?

* * * *

Are not the Torquay Town Council acting patriotically with regard to national afforestation by proposing to plant out with trees another 40 acres of their water-gathering ground? Is it not also good to read that, whereas in 1899 there were only about 11 acres so planted, there are now nearly 183 acres of forest trees? As, however, it is well-known that the planting of trees on gathering grounds sometimes seriously affects the quantity of the run-off of water from a gathering ground, is it not to be hoped that the water engineer has considered this question before planting more trees?

* * * *

Why is the Poole Town Council so averse to the erection of huts at Sandbacks, within their jurisdiction? Why should not people, if they prefer it, live in huts temporarily and enjoy the "natural life," if these huts are not insanitary and are provided with a proper water supply and arrangements for getting rid of the occupiers' "waste products"; and was there any sound argument in one of the councillor's statement that it was unfair to put up these small huts alongside substantial property which had cost £500 or £600?

* * * *

How is the surveyor of Ham, Surrey, going to solve the problem of altering Ham Common so that it shall be isolated in squares, to prevent the spread of fire, and at the same time avoid the chess-board appearance which one of the members of the council feared? Has any other surveyor in this country grappled with a similar problem?

SOMERSET ROADS.

A DIFFICULT YEAR.

Mr. E. J. Stead, the county surveyor of Somerset, is on military service, and the customary annual report on the maintenance and repair of the county roads and bridges is issued this year over the name of Mr. Gordon R. Folland, the acting official.

Mr. Folland states that the period covered by his report has proved a very difficult one in regard to road maintenance, and he anticipates that the ensuing year will prove even more difficult. On the whole, the roads have been maintained in a satisfactory manner, but the effects of the shortage of labour and materials are becoming apparent.

The audited expenditure for the maintenance and repair of the rural main roads for the year 1914-15 (exclusive of establishment charges and improvements) was £93,501, or £107·53 per mile. The estimated expenditure for 1915-16, which Mr. Folland's report covers, was £79,692, a rate of £91·39 per mile.

Only improvements of an urgent character were carried out during the year. The total area of main roads covered, coated, was 999,004 super. yds., with an approximate length of 104·4 miles.

In regard to urban main roads, Mr. Folland states that the audited and allowed expenditure (exclusive of improvements and establishment charges) for 1915-16 was £12,410, which, based on 81·59 miles, averages a rate of £152·102 per mile. The expenditure was £5,031 below the amount of the estimates. The estimated expenditure for 1916-17 is £17,315.

No grants were made during the year towards improvements of a special nature.

SURFACE TARRING.

The estimate for the treatment of an area of 1,732,538 super. yds. was £11,445, being an average rate of 1·58d. per super. yd. The Road Board made a grant of £1,500, based on this estimate. The total length of roads treated was 256,847 yds., with an area of 1,677,841 super. yds. The actual expenditure was £10,715, being an average rate of 1·53 per super. yd. As this expenditure was below the estimate on which the Road Board based their grant of £1,500, the latter was reduced proportionately to £1,404.

Ealing's War Allowances.—Ealing Town Council expenditure in respect of salaries and wages of its staff and employees serving in the Army and Navy has reached a total of £10,946.

Sewage Disposal at Caerphilly.

COMPLETION AND OPENING OF NEW WORKS.

The Caerphilly Urban District Council's consulting engineers, Messrs. Willcox & Raikes, Birmingham, having recently reported the completion of the new scheme of sewerage and sewage disposal for the populous parish of Nelson, the works were formally inspected and opened on July 25th, when the scheme and its development were briefly explained by Mr. Raikes.

The total cost of the scheme is £16,356, which includes £14,366 for works and the remainder for land, easements and incidental expenses, but about half this expenditure is met by the £8,342 received under the conditions imposed by Parliament in the Act of 1912, which provides for sewering the Rhymney Valley, in which the rest of the Caerphilly district is situated.

The sewage disposal works consist of settling tanks and circular bacteria beds, similar to those which were constructed some years ago by the same engineers at Cefn Coed, near Merthyr Tydfil, and both schemes afford the means of very effectually preventing the pollution of the river, which previously occurred at these places.

The site of the disposal works is within the parish adjoining the Nant Mafon, about half a mile west of Nelson, which lies on the watershed between this and another small tributary of the River Taff, so the main outfall sewer had to be constructed in tunnel through the watershed to drain the north end of the village.

The construction of this tunnel involved very considerable difficulties, owing to the waterlogged character of the subsoil met with for a great part of its length, and the remainder was in very hard rock, which necessitated the use of compressed air drills and a considerable amount of blasting.

These difficulties were much less serious, however, than those involved by either of the alternative schemes previously proposed, which provided for disposal works within the borough of Merthyr, or irrigation on unsuitable land within the parish of Nelson, and the scheme adopted is undoubtedly the best.

The works were commenced in August, 1913, and about 100 men were employed in July, 1914; but this number was considerably reduced after the outbreak of war and during the winter months, although special lodging accommodation was provided by the erection of huts on the works.

A large proportion of the labour and material having been obtained locally, most of the money has been spent in the neighbourhood, and the total cost of the works is substantially less than most of the tenders received from other contractors, in spite of the war and other difficulties.

CAPACITY OF WORKS.

The new sewage disposal works are designed to provide for an ultimate population of 8,000, but as this is so much in excess of the present population, only six out of eight bacteria beds have been constructed at present, and these are sufficient to treat the sewage from 6,000 people, whereas the tanks, &c., are sufficient for 8,000. As there is no trade waste and the sewers only receive rainwater from the back roofs and paved yards, the sewage may be described as purely domestic, and the dry weather flow is estimated at 20 gallons per head per 24 hours. This represents 160,000 gallons per day, or, say, 260,000 tons per annum of foul sewage, which the works are designed to purify, together with the usual allowance for storm water before the effluent is discharged into a very small stream adjoining the main road.

The whole plant is so arranged that only one man is required to manage and control the entire process, which produces a bright and perfectly clean effluent, and the degree of purification is such as entirely to prevent the very serious pollution of the Nant Mafon which previously occurred. The site has the great advantage of affording ample fall for the process of purification to be carried out by gravitation, while the length and gradient of the main outfall sewer is such that the sewage reaches the works in a very short time after entering the sewers from the house drains. In order to provide a convenient means of access to the works a new bridge has been built over the Nant Mafon, with an entrance from the main road, and, although the land was inclined to slip before the works were constructed, this tendency has now been stopped by a thorough system of underdrainage to carry off the subsoil water with which the ground was previously saturated.

On reaching the works the sewage is discharged into a small detritus chamber, from which it passes over a gauging weir into the settling tanks. The latter are three in number, with a total capacity of 120,000 gallons, which is sufficient to treat sewage and storm-water up to a maximum rate equal to three times the estimated dry-weather flow of 20 gallons per head per day. When this rate is exceeded during wet weather, the excess passes by an overflow from the detritus chamber into the two storm-water tanks, which have a total capacity of 40,000 gallons, and the effluent from these tanks being comparatively dilute it is discharged direct into the stream.

ARRANGEMENT OF TANKS.

The general arrangement of the tanks is clearly shown on the accompanying plan, and they are all constructed on the same principle, each being provided with inlet and outlet weirs, which are specially designed to prevent the retention of any solid matter upon them and to ensure a uniform flow across the whole width of each tank. There are also scum boards to prevent the passage of floating matter over the outlet weirs, and the concrete floor falls towards the inlet end with a sludge channel down the centre.

For drawing off the supernatant water and sludge each tank is provided with a specially designed telescopic valve, which retains the sludge while the liquid above it is being decanted into one of the other tanks, and the sludge is then discharged by gravitation into the lagoons or drying-beds, which are also shown on the plan. While the sludge remains in these beds most of the liquid is evaporated, but some of it is collected by underdrains, which discharge on to a small irrigation area, which is reserved for its disposal so that when the sludge is sufficiently dry it can be carted out on to the neighbouring land as manure.

The effluent from the settling tanks is discharged on to the bacteria-beds by automatic syphons in the octagonal dosing chambers from which the outlets are connected with the automatic revolving distributors on each bed.

The distributors and dosing syphons are so arranged that the discharge is automatically suspended whenever the supply of tank effluent in the dosing chamber is insufficient to keep the distributors working at a rate which ensures perfectly uniform distribution over the whole surface of the bacteria beds in use. Each pair of syphons is also arranged to work alternately in order that each filter may receive a dose of sewage at intervals, which vary, according to the rates of flow from the tanks, and the discharge from each jet is very carefully adjusted, according to the area which it has to cover.

FILTERS.

The six filters are each 53 ft. in diameter, with an average depth of 5 ft., and, as they are constructed in two terraces of three each, the effluent from the high-level beds can be discharged on to the low-level beds for secondary treatment in dry weather, though this is in practice found to be unnecessary, the effluent from single filtration being quite satisfactory.

The filtering material with which the bacteria-beds are filled consists in hard, burnt furnace clinker, which was very carefully screened to remove dust and graded to the required size for each layer, which vary from 1½-in. gauge at the bottom to ½-in. gauge at the top.

Although the effluent from these bacteria-beds is very highly purified, it is still liable to contain a small quantity of suspended matter, which represents the inoffensive residue from the process of purification, and is very similar to garden soil or humus. In order to intercept this humus the filtered effluent is passed through two upward-flow circular tanks, which are specially designed for separating this very

light and finely-comminuted matter from the clean effluent which is finally discharged into the stream. Each of these humus tanks is 16 ft. deep and 13 ft. in diameter, with the inlet pipe near the bottom, and the effluent is drawn off over white glazed weirs round the top, so that the liquid passes very slowly upwards while the solid matter settles to the bottom. With this arrangement the solids are separated by the natural coagulation of fine particles, and a hand pump is provided by which the deposit can be discharged on to the sludge beds when necessary without emptying the tanks.

The entire scheme has been carried out by Mr. H. E. Buckley, contractor, Bradford, under the immediate supervision of the resident engineer, Mr. W. I. Williams, and the engineers, Messrs. Willcox & Raikes, of Birmingham, have received many congratulations on its success. The Caerphilly Urban District Council may also be congratulated on the completion of the scheme at a cost which only represents about £1 per head for the population provided for in the sewers and sewage disposal works respectively, in spite of the increased prices since the outbreak of war, when a considerable part of the work was still uncompleted.

ROAD MAINTENANCE IN WARWICKSHIRE.

COUNTY SURVEYOR AND WAR-TIME DIFFICULTIES.

The nett cost of ordinary road maintenance in Warwickshire during the year 1915-16 was £41,721. This, Mr. John Willmot, the county surveyor, mentions in his annual report, is equal to a rate of £90·9 per mile, £21·4 less than last year, and £32·6 less than in 1913. Mr. Willmot says, however, that it must not be assumed that the needs of the roads are decreasing, for they were never subject to such heavy traffic as they are now. The reduction in the cost is entirely accounted for by the abnormal conditions which have prevailed during the past two years.

Figures given in the report show that a gradual increase in the motor receipts, which has taken place each year since the Locomotives Act, 1898, and the Motor Car Act, 1903, came into force, has for the present stopped, and last year's total receipts show a slight decrease on the previous year's figures, though the receipts under the head of locomotives have slightly increased. The total amount received, £2,053, represents a rate of £4 10s. per mile, on the total mileage of the roads directly maintained by the council, and would provide for the maintenance at the present rate per mile of about 22 miles of road for a year, or would cover the cost of surface tarring about 35 miles of roads of an average width.

PRICES OF MATERIALS.

The average prices per ton paid for the various kinds of road material purchased during the year were as follow: Granite and basalt, 8s. 4d; Warwickshire stone, 8s. 3d.; tarred material, 12s. 9d.; slag, 5s. 6d.

TARRING WORK.

The bulk of the surface tarring was done by the council's own men. The area dealt with was 909,600 sq. yds., and the cost £4,928, the cost per square yard being 1·30d.

The area tarred extends over a length of about 113 miles of road—about one-fourth of the total mileage maintained by the council. About 138,300 gallons of tar were used, and the area covered per gallon was 6·6 sq. yds., as compared with 6·7 sq. yds. in the previous year. The cost per square yard was rather less than in that year, as the tar was bought at a cheaper rate.

In addition to the above 144,000 sq. yds., representing a length of about 12 miles, chiefly on roads included in the Road Board scheme, were tarred by Tarmac, Limited, at a cost of £900, or 1½d. per square yard.

Apart from the Road Board lengths, no portion of the main roads were coated with tarred material, but upwards of 900 tons of Tarmac were used in patching and filling up potholes—for which, Mr. Willmot observes, this material is admirably suited.

MAINTENANCE PROBLEMS.

"I need hardly say," remarks Mr. Willmot, "that the year just closed has been a very exceptional one. The facts and figures given in the report will show this. The difficulty has been that while many of the more important roads have been subjected to military traffic, which is heavier than the ordinary traffic of the district, the means for carrying out repairs have been far less than usual. The policy of maintaining to a proper standard the roads subject to the heaviest traffic has been adopted, with the result that roads on which the traffic is not so heavy have had to suffer, and are now in need of considerable repair. I have endeavoured, as far as possible, to keep these roads going by filling up the potholes and metalling the worst places, which will, I hope, prevent them getting into a worse condition. There does not at present seem any probability that full supplies of material will be obtained, and with depleted staffs both on the roads and at the quarries, it is evident that the necessary work will have to be carried out under even greater difficulties during the present financial year."

ECONOMY OF TARRED MATERIAL.

With the exception of a few short lengths, the work on which has been postponed at the request of the Road Board until after the war, the whole of the work under the Road Board scheme has been completed. The roads that have been improved are standing up well to the special traffic they now have to carry, and the county surveyor regards it as very fortunate that the work was finished before the increase in the traffic occurred. He trusts it may be possible in the near future, and under happier conditions, to arrange for a somewhat similar scheme on even a larger scale, as he is satisfied that water-bound roads will not stand up to the present traffic, and that it will be true economy to use tarred material in the future.

Mr. Willmot mentions that the urban authorities have experienced the same difficulties in maintaining their roads as the council have had with those under direct control, and from the same causes—viz., shortage of men and materials—but under the circumstances, the roads, although in some cases not kept up to quite the usual standard, have, on the whole, been fairly maintained.

MOTOR 'BUSES AND THE HIGHWAYS.

GRANTHAM'S SCALE OF CHARGES.

Grantham Town Council have adopted a proposal of the Watch Committee consenting to motor omnibuses plying for hire on the highways on routes beyond those used on or before March 1, 1914, on payment of the following annual fees; Under a ton weight, £5; over a ton and under 2 tons, £7; over 2 and under 2½ tons, £10; over 2½ and under 3 tons, £15; over 3 and under 4 tons, £20; over 4 tons, £25; the payments to be made in advance by two equal half-yearly instalments in May and November. Consent will not be granted unless omnibuses are submitted for inspection in May and November, and certified as sound and in good running order.

Aldershot Camp Sewage Farm.—At the last meeting of the Thames Conservancy, the River Purification Committee reported that as the result of letters to the War Office respecting the inadequacy of the North Camp sewage farm, Aldershot, and the consequent serious pollution of the river Blackwater, the military authorities had now accepted a tender for the execution of the scheme proposed.

Main Road Control in Herefordshire.—Ross Rural District Council discussed recently the scheme of the county surveyor, Mr. G. H. Jack, for taking over the sole control of the main roads in Herefordshire. The chairman (Alderman T. Preece) said this was the most important matter that had been before the council for years, and his opinion was that if the rural councils of Herefordshire allowed the county council to take the sole control of these roads that policy would entirely kill local interest and vastly increase public expenditure. The farmers and agriculturists found 70 per cent of the county rates, and they were the people who should have a voice in the control of the roads. After discussion the council unanimously decided to send a report to the county council to the effect that the Ross Council is unanimously of opinion that in the best interests of the ratepayers of the county, the county council should be requested to continue the present system of management of the main roads.

REVENUE FROM REFUSE.

DE-TINNING COMPANY'S SCHEME AND INVITATION TO LOCAL AUTHORITIES.

Not the least profitable among the numerous side-lines of German trade in pre-war days was the treatment and re-use of the old tins which form so large a proportion of domestic and other refuse. Pressed into bales of convenient size, hundreds of thousands of tons of this discarded material found its way across the North Sea to our Teutonic neighbours, who, after extracting from the tins the valuable by-products in the shape of tin, spelter and so forth, returned them to us in the form of toys, brush and mirror backs, purses and trays—to mention but a few articles. With the suspension of traffic between the two countries vast stores of old tins have accumulated here, and engineers to public bodies, engineering firms and military camp authorities are faced with an unexpected problem. For the profitable utilisation of such refuse machinery of a special character is needed, and it is with the object of meeting this demand, and, incidentally, of ensuring that, when peace comes the trade in these old tins does not return to Germany, that the British De-Tinning Company, 75, New-street, Birmingham, are launching the project to which reference was made in a recent issue of this journal. At a meeting of representatives of local authorities which is to be held in London next month, the company will explain their scheme by which those bodies, working on co-operative lines, can dispose of their stores of waste metals with more advantage to themselves than has hitherto been possible. Among the several authorities who have already made a working agreement with the company is the Southwark Borough Council, whose enterprise in the past in the matter of the disposal of refuse is well-known. Mr. Arthur Harrison, the borough engineer, has taken up the De-Tinning Company's process with enthusiasm, and before long Southwark will be in possession of a building and plant, which the firm will erect at a cost of £3,000. When finished this will be handed over in working order to the council, who in consideration are to pay the company 50 per cent of the additional profits accruing from its use.

Next month's meeting promises to be very largely attended, and evidence of the keen interest which is being displayed in the company's scheme—particularly by municipal engineers—is supplied by the list of acceptances which have already been received, and from which we may quote the following names: Messrs. E. E. Finch, city engineer, London; W. Grieg, Glasgow; H. E. Stilgoe, city engineer, Birmingham; F. J. Rushbrooke, borough surveyor, High Wycombe; T. Reader Smith, borough surveyor, Kettering; J. Bird, borough engineer, East Ham; S. Maylaw, engineer and surveyor, Basford; Henry J. Kilford, borough engineer, Ilkeston; F. T. Clayton, borough engineer, Reigate; J. Sutcliffe, borough engineer, Woolwich; W. H. Taylor, engineer and surveyor, Aylesbury; W. H. Grieves, surveyor, Sutton, Surrey; C. R. W. Chapman, surveyor, Wembley; Percy Bennett, engineer and surveyor, Harrow-on-the-Hill; W. W. Cooper, engineer, Slough; D. Roberts, borough surveyor, Lewes; R. H. Jeffes, engineer and surveyor, New Malden; H. Mason, surveyor, Swadlincote; J. C. Radford, Wandsworth; J. E. Hargreaves, engineer and surveyor, Farnborough; Frank Marshall, borough surveyor, Morecambe; W. H. Hambleton, Salford; Horace White, surveyor, Loughton; W. Jones, engineer and surveyor, Colwyn; H. C. Sugden, health superintendent, Colne; A. J. Munro, sanitary inspector, Enfield; H. Gilbert Whyatt, borough engineer, Grimsby; P. A. Benn, city surveyor, Lichfield; E. R. Capon, surveyor, Epsom Urban; Samuel Hutton, engineer and surveyor, Exmouth; J. H. Brierley, borough surveyor, Richmond, Surrey; T. W. A. Hayward, borough surveyor, Battersea; S. H. Chambers, engineer and surveyor, Hampton; P. Dodd, borough engineer, Wandsworth; W. H. Maxwell, borough engineer, Tunbridge Wells; A. C. James, surveyor, Grays; T. B. Crookes, cleansing superintendent, Finsbury; Edward Willis, surveyor, Chiswick; F. Hall Smith, surveyor, Sheringham; Walter R. Locke, engineer, Hemel Hempstead; M. W. Jameson, borough engineer, Stepney; R. Hampton Clucas, borough surveyor, Kingston-on-Thames; William Banks, city surveyor, Rochester; C. Brown, surveyor, Edmonton; William F. Loveday, borough surveyor, Stoke Newington; F. Wood, borough surveyor, Fulham; C. W. Marks, borough surveyor, Wokingham; F. Wilkinson, borough surveyor, Deptford; T. W. Taylor, borough engineer, Ramsgate; H. W. Tomlinson, borough surveyor, Luton; J. Taylor, borough surveyor, Walsall; J. B. Williams, borough surveyor, Daventry; E. Morley, borough surveyor, Walthamstow; J. E. Hattersley, borough surveyor, Buckingham; W. N. Blair, borough engineer, St. Pancras; F. Ayton, Ipswich; I. I. Peacocke, city surveyor, Limerick; E. J. Heward, borough surveyor, Greenwich; E. J. Elford, borough engineer, Southend-on-Sea; F. White, chairman, cleansing sub-committee, Scarborough; Thomas Moulding, city engineer, Exeter; F. H. French, borough surveyor, Harwich; A. E. Nichols, borough engineer, Folkestone; E. A. Borg, borough engineer, Margate; William Banks, city surveyor, Rochester; F. Sadler, surveyor, Acton; E. Morley, surveyor, Walthamstow; D. Waterhouse, engineer and surveyor, Watford; J. D. Kennedy, borough surveyor, Retford; J. E. Carey, engineer and surveyor, Heston and Isleworth; J. A. Crowther, borough engineer, Southampton; W. T. Patrick, Guildford; S. Milnes, Stroud; and W. R. Hicks, borough engineer, Ealing. Other authorities to be represented at the meeting include: City of Westminster, Torquay, Newport, South Shields, Leicester and Swansea.

We are asked to say that surveyors who desire to attend and have not received an invitation to the meeting should communicate at once with the company.

STEAM TRACTORS FOR REFUSE COLLECTION.

A COMPARISON WITH HORSE HAULAGE.

Mr. H. Hopkinson, cleansing superintendent to the Portsmouth Corporation, has submitted the following in connection with the discussion on steam tractors which took place at the recent conference of the Institute of Cleansing Superintendents at Cardiff:—

Cost of Collection of House and Barrack Refuse by Steam Motor ("Foden") Wagon and Trailer.

Carrying capacity of Wagon attached to motor	...	11½ cub. yds.
" " " Trailer " " "	...	11 " "
		22½
Weight per load of Wagon ... ... 3 cub. yds. per ton ...		3 tons 13 cwt. 1 qr.
Trailer ... ... 3 " " " ...	...	3 " 13 " 1 "
		7 " 6 " 2 "
2 loads per day of both wagon and trailer ...	...	14 tons 14 cwt.
Cost " " " " " ...	...	Fuel, &c., 4s. 7½d.
		Wages ... 8s. 4d.
		Total... 12s. 11½d.
14 tons 13 cwt., or 44 cub. yds., cost	... ...	12s. 11½d.
1 ton, " 3 " " "	... ...	10½d.
6 cwt. 2 qr., " 1 " " "	... ...	3½d.

Cost of House and Barrack Refuse Collection by Corporation Horse and Cart.

Carrying capacity of ash cart	4 cub. yds.
Weight per load of ash cart (average)	1 ton, 6 cwt.
Average No. of loads per horse—2½ per day = 3 tons, 5 cwt.	
Cost per day for 1 day's work	10s. 4d.
Therefore:—	
45 horses collect 112½ loads, or 450 cub. yds., average weight, 146 tons, 5 cwt., costing	£23 5s. 0d
1 horse will collect 2½ loads, or 10 cub. yds., average weight, 3 tons, 5 cwt., costing	10s. 4d.
1 horse will collect 1 load, or 4 cub. yds., average weight, 1 ton, 6 cwt., costing	4s. 1d.
1 horse will collect ¼ load, or 1 cub. yd., average weight, 6 cwt., 2 qr., costing...	1s. 0½d.
3 cub. yds., average weight, 1 ton, costing	3s. 0½d.

So it will be seen by the above that the cost of haulage by motor is 2s. 2½d. less per ton (3 cub. yds.), or 9½d. less per cub yd. (6 cwt. 2 qr.).

Horse.

	Loads		Cub. yds.	Weighing Tons	cwt.	Costing £	s.	d.
In 1 day 1 horse collects	2½	or	10	3	5	0	10	4
In 1 week 1 " "	15	or	60	19	10	3	2	0
In 1 year 1 " "	780	or	3,120	1,014	0	161	4	0

Motor and Trailer.

	Loads		Cub. yds.	Weighing Tons	cwt.	Costing £	s.	d.
In 1 day 1 motor and trailer collects	2	or	14	14	13	0	12	11½
In 1 week 1 motor and trailer collects	12	or	264	87	18	3	17	9
In 1 year 1 motor and trailer collects	624	or	13,728	4,570	16	202	3	0

Surveyors' Petrol Allowances.—At the last meeting of East Preston (Sussex) Rural District Council, the surveyor, Mr. C. W. Leney, stated that the Petrol Control Committee had allowed him only six gallons of petrol for thirteen weeks for his motor cycle. If he was properly to supervise his men and work he required at least 18 gallons, and he asked the council to support his application for a larger supply than that allowed. This the council decided to do.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor readers with a view to making the information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars have reached us during the present week. Other reports will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Bridport T.C.—The borough surveyor, Mr. F. Cooper, has prepared a report on a scheme of proposed repairs and alterations to the town hall.

Cumberland C.C.—It was reported that the final cost of the new bridge over the Esk was £16,261, or £1,024 less than the original contract, £17,266. The council agreed, on account of the unforeseen cost incurred by the contractors in order to complete the work without delay, to make a grant of £500 extra towards this expenditure. It was also resolved that, as the difficulty in obtaining labour arose on account of the high wages paid at Gretna, and that as the work at Gretna made it important that the bridge should be finished without delay, the Munitions Department be approached with a request for a grant towards the extra cost. In conclusion, the thanks of the council were given to the county surveyor, Mr. W. Finch, and his staff, for the excellent manner in which they had carried out the work, an honorarium of 100 guineas being voted to them for the extra services which they had been required to render.

Exeter T.C.—The borough surveyor, Mr. T. Moulding, submitted to the Sanitary Committee tenders for the erection of a four-bed smallpox pavilion, with nurses' room and out-offices, together with the necessary roadmaking and draining, and the committee recommend that the tender of Mr. E. C. Lea, at £1,215, be accepted.

Halifax T.C.—The borough engineer, Mr. J. Lord, has been authorised to obtain tenders for the construction of a concrete bridge at Clark Bridge.

Stockport T.C.—The Electricity Committee recommend the purchase of property in Millgate, at a cost of £2,700, for the erection of a generating station.

Stockton T.C.—The deputy borough engineer reports that the estimated cost of repairs to Yarm-road and Hartburn railway bridges will be £1,089.

Thurlstone (Yorks) U.D.C.—The need for a mortuary was discussed recently, a medical member stating that it was a horrible thing to hold a post-mortem in a cottage. It was decided to defer the matter until after the war.

West Sussex C.C.—"Wren House," Chichester, designed by Sir Christopher Wren, dated 1696, and the residence of the late Sir Arthur Fairbairn, has been bought for £5,500 by the West Sussex County Council for offices.

HOUSING AND TOWN PLANNING.

Burry Port U.D.C.—Representations are being made with a view to obtaining a Government grant towards the cost of building 200 houses for a permanent departmental staff and workmen.

Chesterfield T.C.—A sub-committee has been asked to report upon the desirability of a local housing scheme.

Coalville U.D.C.—The surveyor, Mr. L. L. Baldwin, has been asked to report upon a proposal to build houses at Whitwick.

Felling U.D.C.—A committee has been appointed to consider the question of a town planning scheme.

Shrewsbury T.C.—The town council have authorised the Improvement Committee to take the necessary steps for promoting a town planning scheme.

MOTOR TRANSPORT.

Barrow T.C.—It is proposed to purchase an electric battery vehicle.

Bradford T.C.—The city council are asking permission to borrow £3,700 for the provision of three battery tip-wagons.

Chester-le-Street R.D.C.—It is proposed to purchase two Foden 3-ton end-tipping wagons, at £660 each.

Ilford U.D.C.—The surveyor, Mr. H. Shaw, has been asked to prepare a report on motor lorries and motor street-watering vehicles.

Newcastle-on-Tyne T.C.—The city council have confirmed the proposal of the Watch Committee to purchase, for £1,271, an additional motor fire engine, a duplicate of that bought for £1,296 at the beginning of the year, the difference in the price being due to the fact that some spare parts and minor accessories would not require to be duplicated.

REFUSE COLLECTION AND DISPOSAL.

Richmond (Surrey) T.C.—At the last meeting, the Surveyor's Committee presented a report on the proposal to burn the Richmond refuse in a dust destructor to be erected on the works of the main sewerage board at Mortlake. The report stated that the engineer to the board, Mr. W. Fairley, estimated the total capital expenditure to be provided by the corporation for buildings, machinery and plant at £12,500, and the total estimated annual cost to the corporation at £1,412. The corporation now paid to the contractors, for removal by rail, 7,600 tons at 4s. 6d. per ton, £1,710, and on present war conditions the scheme showed an estimated saving to the corporation of £298 a year, and on pre-war conditions an increased cost of £177 a year. A member strongly denounced the agreement on the ground that under it Richmond would have to pay £12,500 for a dust destructor which would not be their property. At the end of the period for which the money was borrowed the Sewerage Board could do what they liked. Finally the question was referred to the Surveyor's Committee with instructions to obtain further information, and to prepare an alternative scheme.

ROADS AND MATERIALS.

Accrington T.C.—By the offer of a piece of land in Hyndburn-road, the town council will be enabled to carry out a widening scheme at an estimated cost of £50.

Berks C.C.—An estimate of the damage caused by military traffic on the main road from Reading through Shinfield and Aborfield is being prepared with a view to a claim being made on the War Department.—The Road Board have made a grant of £1,505 for surface tarring.

Blackpool T.C.—The town council have referred to a sub-committee a proposal for the extension of the promenade southwards, and the development of the South Shore.

Burgess Hill U.D.C.—The council have accepted the tender of Messrs. Chittenden & Simmons for the hire of a steam roller with scarifier, at 30s. per day.

Cheshire C.C.—In the course of the last meeting, the chairman, Colonel Dixon, alluded to the question of the employment of German prisoners of war from Handforth Camp in repairing certain Cheshire main roads. A letter had, he stated, been received from the commandant of the prisoners' camp and the general officer commanding, intimating that it would not be advisable to employ them. Also there would be difficulty in transporting the men to work in different parts of the county, owing to the petrol restrictions.

Croydon T.C.—The council agreed to the recommendation of the Roads Committee for the acceptance of the following tenders for horse hire, for the six months commencing October 1st next: Croydon district, Mr. A. Bullock: Norwood district, Mr. Jason Ive. The price for the Croydon district is increased by 6d. per man and 3d. per horse per day, representing an increased cost to the department for the six months of £150. The price for the Norwood district is the same as at present paid.

East Grinstead R.D.C.—The surveyor, Mr. C. Turton, has been authorised to obtain for experimental purposes one truck of "Bituspray," and the necessary covering material to treat a portion of the district road, at a cost of about £30.

Exeter T.C.—The city surveyor, Mr. T. Moulding, has been requested by the Streets Committee to report generally on the method of construction of roads within the municipal boundary. The city surveyor reported that in the past difficulties had arisen in connection with the reinstatement of openings in roads and footpaths. He had interviewed the secre-

tary of the Exeter Gas Company, and it was agreed that the most satisfactory way of overcoming the difficulty would be for the city council to make good excavations at the cost of the persons making such openings. The Streets Committee resolved that the city surveyor be authorised to make arrangements with the gas company for the reinstatement by the council at the company's expense of all roads and footpaths opened up by the company, and subject to the latter indemnifying the council against all actions and claims by third parties arising from or in consequence of such work.

Halifax T.C.—The borough engineer, Mr. J. Lord, has been instructed to carry out the street widening at Barum Top and in King's Cross-lane, near the junction of Bull Green and Barum Top, at an estimated cost of £500.

Lanarkshire C.C.—It was stated at a meeting recently of the Middle Ward Committee that in connection with the upkeep of the roads it would be necessary to do a good deal of tar-macadam work, and that a grant towards the expenditure had been obtained from the Road Board.

Oulton Broad U.D.C.—The council have accepted the offer of the Great Yarmouth Gas Company for the supply of tar at 12s. 6d. per cask.

Reading T.C.—An estimate of £1,575 has been approved for permanent way renewals.

Richmond (Yorks) R.D.C.—The council on Saturday rescinded a former resolution which they passed to support the making of a new road from Richmond. The chairman (Mr. G. T. Gilpin-Brown) said the county council had declined to take the road over as a main road, as was suggested by the Road Board. The council had ascertained that the cost of maintaining it would be about £2,000 per annum, and they were not willing to incur such a liability, seeing that the road would only serve the services of the camp.

Scarborough R.D.C.—The surveyor, Mr. J. A. Iveson, reported that the county council had made a special grant of £300 for tar-spraying the main roads.

SEWERAGE AND SEWAGE DISPOSAL.

Bournemouth T.C.—The borough surveyor, Mr. F. P. Dolamore, has been authorised to proceed with the drainage of the cliffs in the vicinity of the Toft Steps.

Chester-le-Street R.D.C.—It was stated that so many officers had been allowed to join the forces it was impossible to carry on the sanitary work of the district, and the council referred the matter to the Staff Organisation Committee.

Fifeshire C.C.—In order to cope with the periodical flooding at Inverleven the Kirkcaldy District Committee have agreed to contribute two-thirds of the cost, estimated at £100, of laying an additional 12-in. pipe.

WATER, GAS, AND ELECTRICITY.

Bradford T.C.—The Local Government Board have vetoed a proposed loan for the extension of the electrical plant. They have, however, sanctioned proposals for the extension of mains without reference to the department.

Derby T.C.—Water main, electricity, and sewer extensions are to be carried out at an estimated cost of £6,650.

Halifax T.C.—A sub-committee has been authorised to consider the question of installing plant for the supply of benzol and toluol.

Hammersmith B.C.—Further negotiations with the Treasury and the Board of Trade are proceeding with reference to the scheme for linking up the electricity undertaking with those of Fulham and Battersea. The communication link between Fulham and Battersea has already been established.

Salford T.C.—The Gas Committee recommend that application be made to the Local Government Board for a further sanction to borrow £10,000 to cover capital expenditure in connection with the gas undertaking in respect of loans sanctioned last year.

Waterford T.C.—The City of Waterford Gas Company proposed to increase the price of gas supplied to the corporation by 50 per cent, and to reserve the right to substitute flat flame burners, consuming not less than 4 cub. ft. per hour, in the event of their not being able to obtain a sufficient supply of mantles. The town council have passed a resolution objecting to any increase of price beyond 25 per cent, and claiming the power to reduce the number of lamps if this was considered desirable.

MISCELLANEOUS.

East Grinstead U.D.C.—The surveyor, Mr. C. Turton, has been authorised to purchase six dozen scavenging brooms at 35s. per dozen.

Hartlepool T.C.—The town council have referred the provision of a sand screen at Throston to the Improvement and Property Committee.

Okehampton R.D.C.—The surveyors (Mr. S. Hooper and Mr. G. Smale), who are acting as sanitary inspectors in the absence on military service of Mr. Hugh Ward, the sanitary inspector, having been requested by the council to suggest a sum as remuneration for their services during the past year, asked that they should be given an honorarium of £10 each. The sum was considered reasonable, and payment was ordered.

FOR OTHER ADVERTISEMENTS
See End of Paper.

URBAN DISTRICT COUNCIL OF BEESTON (NOTTS).
SURVEYOR AND INSPECTOR OF NUISANCES.

The above Council invites applications for the post of Surveyor and Inspector of Nuisances. The person appointed must devote whole time to the service of the Council, reside in the district, be competent to prepare plans, specifications, estimates, &c., have a thorough knowledge of construction and maintenance of roads. Applications should be made in own handwriting, stating age, experience, qualifications, &c., accompanied by copies of not more than three recent testimonials. Envelopes to be sealed and endorsed "Surveyor and Inspector," addressed to me, the undersigned, not later than September 1st. Salary £225 per annum (Surveyor £105, Inspector £120). The appointment as Inspector will be subject to the approval of the Local Government Board and to the regulations made by them.

Canvassing the Members will disqualify.

(By order of the Council)

W. H. REDGATE,
Clerk.

Bentinck Buildings,
Wheeler Gate, Nottingham.
August 10, 1916. (3,068)

SOMERSET COUNTY COUNCIL.

Wanted, Temporary Assistant in County Surveyor's Office. Must have good knowledge of modern road and bridge construction, be an active motor cyclist, and ineligible for the Army. Apply, giving age, full particulars of experience, salary required, &c., to

GORDON R. FOLLAND,
Acting County Surveyor.

13 Chamberlain-street,
Wells, Somerset. (3,066)

BOROUGH OF HEMEL HEMPSTED.
SURVEYOR'S ASSISTANT.

Applications are invited from men ineligible for military service during the absence of one serving with the Colours. Salary £80 to £100, according to experience.

Forms of application may be obtained from the undersigned, to whom they should be returned not later than August 26th.

W. R. LOCKE,
Borough Surveyor.

Town Hall,
Hemel Hempsted.
August 9, 1916. (3,069)

MENSTON PARISH COUNCIL.

Tenders are invited for 12 Street Lamp Standards which have been taken up owing to alteration in lighting. Tenders must reach me not later than Tuesday, the 5th September, 1916.

PHIL. S. WADE,
Clerk.

Union Offices,
Otley. (3,067)

WANTED—THE SURVEYOR, January 20, 1899, and February 23 and March 2, 1900. Offers to the Publisher, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

PERSONAL.

Mr. W. T. Hatch, engineer in chief to the Metropolitan Asylums Board, has resigned.

Mr. J. R. Denbow, highway surveyor to the Kingsbridge Rural District Council, has received an increase of salary.

Mr. Percy Morris, town planning assistant to the Doncaster Rural District Council, has been appointed surveyor to the Leigh Rural District Council.

Mr. J. Bintley, county surveyor of Westmorland, has been injured and severely shaken in a driving accident, the horse having taken fright at a train.

Mr. I. F. Wardle, surveyor to the Bolsover Urban District Council, was married recently to Miss Ruth Twigge, third daughter of Mr. and Mrs. T. G. Twigge, of Steeple Grange.

Lieutenant Walter J. Houghton, Assoc.M.Inst.C.E., M.R.S.I., a member of the city engineering staff of Cape Town, is serving with the British forces in German East Africa.

Mr. Singleton Goodwin, M.Inst.C.E., county surveyor of Kerry, has received a vote of sympathy from the county council upon the death of his only son, Lieutenant Goodwin, at the front.

Mr. S. L. Christie, burgh surveyor of Montrose, has been granted conditional exemption from military service. In addition to his own duties he is acting on behalf of the burgh surveyor of Arbroath, who is with the colours.

Mr. S. Mitchell, surveyor to the East Kerrier Rural District Council has resigned, having received an appointment under the Norfolk County Council. He told the rural council that his salary was insufficient to meet his liabilities.

Mr. Edward Wembridge Ingamells, the district surveyor at Southbourne, has been appointed deputy borough engineer of Bournemouth at a salary of £325, and Mr. Harold Robert Homewood, of the borough engineer's department, has been appointed to take Mr. Ingamells' position at Southbourne, at a salary of £175.

Mr. H. C. Cordon, surveyor to the Aylesbury Rural District Council, has received permission from the council to accept a "small honorarium" from the Road Board for assistance given in the construction of certain camp roads. The chairman, Mr. J. W. Grist, expressed gratification that Mr. Cordon's work had been appreciated by the Road Board.

Mr. W. S. T. Haseldine, assistant surveyor, has been appointed surveyor to the Wath-on-Dearne Urban District Council, in succession to Mr. J. H. Drew, who has been appointed borough surveyor and waterworks engineer at Grantham. Mr. Haseldine has been loaned to the Road Board, who are willing to release him when required. The salary is £160 per annum.

Mr. W. J. Steele, city engineer of Newcastle-on-Tyne, read a paper, entitled "The King's Highway," recently, before the members of the Newcastle Rotary Club. In the course of his remarks he said there was no doubt that when all traffic was mechanically driven, one of the difficulties of road construction and maintenance would be removed, but generally the cost would be very much higher, as many roads would have to be entirely reconstructed, and others strengthened to carry traffic which would be very much heavier than at present. The annual cost of maintaining, cleansing, watering and lighting the highways of Newcastle was equivalent to an average of £340 per mile, 6s. 4d. per head of the population, and 1s. per £ of the assessable value.

Mr. F. Reginald Phipps, borough surveyor and waterworks engineer of Basingstoke, whose valuable paper on Diesel engines, read at the recent annual meeting of the Institution of Municipal and County Engineers, is reproduced on another page of this issue, was articled to the borough surveyor of Tewkesbury, from 1903-7, afterwards becoming engineering assistant to the city engineer of Worcester, and being engaged in the carrying out of various large undertakings, including waterworks extension, a sewerage scheme with ejectors, storm overflow provision, street improvements, and the construction of a river embankment. In 1903 he was appointed borough surveyor and waterworks engineer at Basingstoke, where numerous important works carried out under him have included a new water supply scheme, sewerage and sub-drainage (reducing the amount of sewage pumped by one-half), the provision of a refuse destructor (utilising steam for pumping sewage), an open-air swimming bath, a new cemetery with chapel, lodge, &c., and a new fire station. In 1914 he completed an electric lighting scheme for the town, at a cost of £14,000, the motive power being Diesel engines, which, as stated

Mr. F. Reginald Phipps,
Borough Surveyor and Waterworks Engineer, Basingstoke.

forms the subject of the paper read at Blackpool. Mr. Phipps is an associate member of the Institution of Civil Engineers, a fellow of the Surveyors' Institution, a member of the Institution of Municipal and County Engineers, and qualified by examination as a member of the Royal Sanitary Institute.

KILLED IN ACTION.

Lieut. I. L. Peacocke, of the Royal Engineers (Ulster Division), formerly surveyor and water engineer of Newtownards, has been killed in action.

Private Alexander Brown, burgh surveyor and engineer of Wishaw, has fallen in the fighting line. He was 28, and joined the Cameronians eight months ago. His battalion was engaged in consolidating ground gained in a wood when he was struck by the fragment of a shell.

Second-Lieutenant G. R. B. Mazengarb, of the 1st East Surrey Regiment, a nephew of Mr. H. W. Longdin, surveyor to the Penge Urban District Council, and articled to him, was, we regret to state, killed in action on July 29th. Mr. Mazengarb was the only son of Mr. and Mrs. G. A. Mazengarb. He was educated at the Coopers' Company School, where he was captain of the school, and won the school championship at sports. After matriculating at the London University, he was articled to Mr. Longdin, and was enrolled as student of the Surveyors' Institution and the Institution of Municipal and County Engineers. He joined the Inns of Court O.T.C. in December, 1914, and received his commission in March, 1915, being gazetted to the 3rd East Surrey Regiment. He was attached to the 1st Battalion in August, 1915, and was serving with it when killed. His Colonel writes: "He was one of the finest characters I have ever met; his utter unselfishness and devotion to duty was most marked. I mourn not only the loss of a very gallant officer, but also one who had become to us all a very dear comrade." Deceased was only twenty years of age, and was a fine all-round athlete.

DARTMOUTH AND MOTOR TRACTION.

BOROUGH SURVEYOR'S INQUIRY.

Mr. F. J. Voisey, borough surveyor of Dartmouth, writes: "The Dartmouth Town Council contemplate substituting motor for horse traction in removing the town refuse. Would any of your readers who have adopted this means of locomotion, or makers of suitable vehicles, communicate with me? Ours is a small town of 7,000 inhabitants, and a hilly district."

CRYSTAL PALACE SCHOOL OF PRACTICAL ENGINEERING.

The first distribution of certificates in the new premises to which the school has been removed was held on 18 August, and the building, being situated approximately midway between the two Crystal Palace stations, and close to the South Tower, it did not come. The president of the Institution of Civil Engineers who let his audience into the secret that in his younger days he had become Colonel Ross), after describing the practical character of the work of the school, and the excellence of the exhibits in the classrooms that day, alluded to the Institution of Civil Engineers' requirements for membership and to the advantages offered in the Crystal Palace School to those desiring the office or profession of a civil engineer.

After a vote of thanks to the examiners, Messrs. H. C. H. Shenton, F.S.E., and Gordon W. Harris, M.I.MECH.E., the principal addressed the meeting.

Mr. A. T. Walmisley, M.INST.C.E., engineer to the Dover Harbour Board in proposing a vote of thanks to the chairman, said it was appropriate that Mr. Ross should preside at this first distribution of certificates in the new premises of the school in view of the very great interest which he was known to take in the welfare of the young engineer. Mr. Walmisley, turning to the students, then said that at the conclusion of the course of training in this school it was not expected that students could settle questions requiring skilled practice. The ability to deal with such matters efficiently could only be acquired by definite experience. But, he added, "you are expected intelligently to comprehend fundamental principles, so as to be able to appreciate their application in any work committed to your care." He did not think it possible to make excellence in a design without the aid of a drawing, and for that reason he was pleased to see so many good drawings exhibited that day. The school always turned out good draughtsmen. He had in the past had occasion in his office, but as regards the graphic diagrams, which, so far as seen in the classroom, were excellent, he might add a word of caution for future work, and that was, in dealing with graphic methods, never to draw a line or a curve for which one was unable to give mathematical proof, as nothing upset a design so fatally as a line wrongly drawn on a graphic diagram. To secure accuracy, repetition must never exclude thought. Difficulties were our daily experience, but must not discourage us. Like the weights on old-fashioned clocks, difficulties were not made to stop us, but to keep us going. The history of all success was the history of difficulty overcome.

Mr. Ross expressed his appreciation of the reception given to him.

MUNICIPAL TRAMWAYS ASSOCIATION.

ANNUAL MEETING PROGRAMME.

The annual meeting of the Municipal Tramways Association will be held at the Surveyors' Institution, Westminster, on Thursday and Friday, September 21st and 22nd.

The proceedings will open at 11 o'clock on the Thursday, when Mr. Peter Fisher, general manager of the Dundee Corporation Tramways, will deliver his presidential address.

The following papers will be submitted for discussion:

"Some Notes on Passenger Transportation in Large Cities," by Mr. J. M. McElroy, general manager of the Manchester Corporation Tramways.

"Utilisation of Tramways for Goods Traffic," by Messrs. G. W. Holford, general manager of the Salford Corporation Tramways, and W. Clough, general manager of the Bury Corporation Tramways.

Exmouth Marine Parade.—In connection with this work, an account of which appeared in our issue of last week, we are informed that Messrs. Tom Wilkinson & Co., the Bridge Wharf, Poole, Dorset, are the contractors for the reinforced-concrete roadway to which reference was made, as well as for the half mile of reinforced concrete and masonry sea defence work carried out by the district council (Mr. Samuel Hutton, engineer). Messrs. P. Wilson & Co. are the contractors for Lord Clifden's wall (Messrs. Douglass, Lewis & Douglass, engineers).

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

DISTRICT SURVEYOR.—August 14th. Alresford Rural District Council. £150.—Mr. J. Ridley Shield, clerk, East-street, Alresford, Hants.

TEMPORARY MAIN ROAD SURVEYOR.—August 19th.—Cornwall County Council. £150 per annum.—Mr. L. D. Thompson, county surveyor, County Hall, Truro.

HIGHWAY SURVEYOR.—August 26th.—Claypole Rural District Council. £150.—Mr. A. J. Franks, clerk, 24 Lombard-street, Newark.

GAS AND WATERWORKS MANAGER.—August 28th. Devizes Town Council. £200 per annum. The Town Clerk, Devizes.

SURVEYORS' CLERKS AND DRAUGHTSMEN.—For military hutments near Salisbury. 5s. to 7s. 6d. a day.—The Commanding Royal Engineer, Heytesbury, Wilts.

SURVEYOR OF HIGHWAYS.—Peterborough Rural District Council. £125.—Mr. W. B. Buckle, clerk, 49 Priestgate, Peterborough.

TEMPORARY DRAUGHTSMAN.—Corporation of Blackburn.—Borough and Water Engineer, Town Hall, Blackburn.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

WILTON.—August 12th. For the repair of a bridge, for the rural district council.—Mr. R. A. Skelton, surveyor, Wilton-road, Bemerton.

MANCHESTER.—August 17th. For clearing a site and building retaining walls and abutments, forming an inclined railway, for the Gas Committee.—Mr. F. A. Price, superintendent, Gas Department, Town Hall.

LICHFIELD.—August 17th.—For the construction of a brick and concrete culvert, for the rural district council.—Mr. C. D. Rawstron, surveyor, Station-road, Lichfield.

CARDIGAN. — For cementing and waterproofing walls, constructing new lead valleys, improvements to water supply, and general repairs to a school, for the Education Committee.—Mr. G. Dickens-Lewis, county architect, Aberystwyth.

Engineering: Iron and Steel.

SINGAPORE.—August 14th.—For the construction of a steel bridge, for the Public Works Department.—Chief Clerk, Colonial Engineer's Office, Singapore.

BARKING.—August 15th.—For the supply of extra high-tension cables, main switchgear, sub-station switchgear, and transformers, for the Electricity and Tramways Committee.—Mr. W. E. Kidner, acting engineer and manager, Electricity Works, East-street, Barking.

SHEFFIELD.—August 15th.—For the supply of materials and work required in connection with contract 186 (excavation from site of proposed cooling towers and building concrete and brick retaining-walls), for the Electric Supply Committee.—Mr. S. E. Fedden, general manager and engineer.

MANCHESTER.—August 15th.—For the supply of hoist gear, motor cage, and hoist well, for ash-handling plant, for the Electricity Committee.—Mr. F. E. Hughes, secretary, Electricity Department, Town Hall.

LIVERPOOL.—August 16th.—The guardians of West Derby Union are prepared to purchase a good, second-hand vertical boiler, of Cochran, Essex, or other approved make.—The Clerk, Brougham-terrace, West Derby-road, Liverpool.

SHEERNESS.—August 16th. For the supply of a Cornish boiler, for the Guardians of Sheppey Union.

—Mr. J. Hill, engineer, 46 St. George's-avenue, Sheerness.

SALOP. August 16th. For pulling down and rebuilding the wall and strengthening a bridge, for the county council. Mr. M. S. Stobbs, acting county surveyor, County Buildings, Shrewsbury.

SPENNYMOOR.—August 19th.—For the construction of a culvert, for the urban district council.—Mr. C. R. Spencer, surveyor, Town Hall.

LONDON.—August 22nd.—For the supply of 1,000 forged steel driving wheel tyres, and 500 forged steel trailing wheel tyres, for electric tramcars, for the county council.—Chief Offices, London County Council Tramways, 62 Finsbury-pavement, E.C.

EDMONTON.—August 23rd.—For altering and erecting ironing and other laundry plant, for the Guardians. Mr. J. C. S. Mummery, architect, 13 Fitzroy-square, London, W.

ISLE OF THANET.—August 24th.—For the supply of two wrought-iron galvanised hot-water tanks, for the Guardians.—Mr. A. E. Fussell, Hill House, Minster, near Ramsgate.

STOCKBRIDGE.—For the creation of 80 yds. of fence and 60 yds. of retaining wall, for the rural district council.—Mr. W. J. Ayles, district surveyor, Broughton, Stockbridge.

Roads.

ROMFORD.—August 14th.—For the supply of 920 tons of granite, for the rural district council.—The Highway Surveyor, 16a South-street, Romford.

JOHANNESBURG.—August 14th-15th.—For the supply of 1,600 tons of tar or tar substitute, for the municipal council.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, E.C.

LONDON.—August 15th.—For the supply of 370,000 creosoted deal paving blocks, for the county council.—Chief Officer, L.C.C. Tramways, 62 Finsbury Pavement, E.C.

SCUNTHORPE.—August 30th.—For the supply of any quantity up to 400 tons of broken granite of approved quality, for the urban district council.—Mr. Herbert Heap, engineer and surveyor, 110 High-street, Scunthorpe.

Sanitary.

WIGAN.—August 21st.—For the supply of 250 galvanised sanitary pans, for the corporation.—Mr. W. H. Tyrer, town clerk.

WANDSWORTH.—August 21st.—For surface water drainage works at Wandsworth Cemetery, Magdalen-road, Wandsworth, for the borough council.—Mr. P. Dodd borough engineer, 215 Balham High-road, London, S.W.

Stores.

GOSPORT.—August 10th.—For the supply of artificial stone paving, broken stone for macadamising, brooms, castings, cement, lime, disinfectants, stoneware pipes and ironmongery, for the urban district council.—The Surveyor, Town Hall.

ROCHESTER.—September 5th.—For the supply of road metal, brooms, horse hire, and tools, for the corporation.—Mr. W. Banks, city surveyor, Guildhall.

Miscellaneous.

WARSOP.—August 14th.—For laying out a portion of the new burial ground, for the urban district council.—Messrs. Vallance & Westwick, White Hart-chambers, Mansfield.

SOUTHAMPTON.—September 4th.—For dredging work in the River Itchen, for the Harbour Board.—The Engineer, Harbour Board's Offices.

Road Work for Conscientious Objectors.—Conscientious objectors are to be employed to carry out a scheme of reconstruction of the Newhaven to Seaford road, which is about to be begun at the request of the Road Board.

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

SEPTEMBER.

21-22.—Municipal Tramways Association: Annual Meeting, Surveyors' Institution.

APPOINTMENTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

O. H. M. S.

VACANCIES at Military hutments near Salisbury, for men ineligible for the Army:—

Surveyor's Clerks and Draughtsmen.

Wages 5s. to 7s. 6d. a Day.

Hut accommodation (single) provided; travelling expenses not allowed.

Apply with references, &c., to:—

THE COMMANDING ROYAL ENGINEER,
(3,064) HEYTESBURY, WILTS.

THE RURAL DISTRICT COUNCIL OF CLAYPOLE, IN THE COUNTY OF LINCOLN.

APPOINTMENT OF TEMPORARY HIGHWAY SURVEYOR, SANITARY SURVEYOR, AND INSPECTOR OF NUISANCES.

The above Council invite applications for the appointment of the combined offices of Temporary Highway Surveyor, Sanitary Surveyor, and Inspector of Nuisances for the Rural District of Claypole.

There are about 180 miles of roads and twenty-six parishes in the district.

The salary for the combined offices (which is in every respect inclusive) will be £150 per annum, and the appointment will be made for the duration of the war or until the return of the Council's permanent Surveyor, who is on military duties. The person appointed must be fully qualified and ineligible for the Army and will be required to reside in the district and to devote the whole of his time to his duties, and to give approved security in the sum of £300 for the faithful discharge of the same.

Applications, marked "Temporary Highway Surveyor," in the candidate's own handwriting, stating age, qualifications, and previous experience, and when the candidate could commence his duties, and accompanied by copies of not more than three recent testimonials, must be delivered at my office not later than Saturday, the 26th inst.

The appointments will be subject to the approval of the Local Government Board.

Canvassing members of the Council, either directly or indirectly, will be deemed a disqualification.

By order,

A. J. FRANKS,
Clerk to the Council.

24, Lombard-street, Newark.
August 8, 1916. (3,065)

APPOINTMENTS WANTED.

YOUNG Gentleman (20 years), with army discharge, requires appointment in Architect's or Surveyor's Office. Tracing, designing and clerical work. Good professional references. Apply W. E. Jefferiss, "Elm Villa," North-street, Romford. (3,060)

MACHINERY AND PLANT.

STEAM FIRE ENGINE (horse-drawn) for Sale, capacity, 800 gallons per minute; 6-in. suction and two 4-in. deliverers. Maker, R. T. Gould, New Jersey, U.S.A. Suitable for small borough or gentleman's estate. Can be viewed at Hugh Stevenson & Sons, Limited, Summerstown Works, Lower Tooting, London, S.W. (3,063)

MISCELLANEOUS.

WANTED, The Surveyor, Vols. 24 to 42 inclusive, and Vol. 44, in publishers' cases or unbound. Offers to the Publisher, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C.

WANTED immediately, Hire or Purchase, 6-8-ton Steam Roller; good working order.—Full particulars and lowest cash to Box 1,579, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C. (3,062)

The Surveyor

And Municipal and County Engineer.

Vol. L. AUGUST 18, 1916. No. 1,283.

Minutes of Proceedings.

Omnibus Routes.

We have already drawn the attention of our readers to the provisions of the Local Government (Emergency Provisions) Act dealing with the control of omnibus routes, but, in view of the importance of the subject, we are constrained to return to it and to say something in regard to the administrative difficulties with which it is surrounded. At first sight, sec. 20 of the Act might appear to operate to prevent, for the duration of the war and a certain period afterwards, the establishment of any new line of omnibuses without the consent either of the local highway authority or of the Local Government Board. But on consideration it becomes apparent that this is not the case. The section is certainly open to the interpretation that where a route has been regularly used by any omnibus service during the prescribed period, that route can in the future, notwithstanding the provisions referred to, be used freely by other lines of omnibuses. Again, the exemption from this part of the Act which is given to lines of omnibuses which have "regularly" used any route raises a question as to the meaning of the word which we have placed in inverted commas, which can only be authoritatively determined by the High Court.

The whole question was recently considered by the County Councils Association, and that body adopted a series of resolutions on the recommendation of their Highways Committee. The first of these resolutions expresses the opinion that it is desirable that, so far as possible, county councils should, through their Highway Committees, act in concert with and as agents for the various minor highway authorities within their area in the administration of the section. While it is certainly to be hoped that some means may be devised for securing uniformity in the administration of the Act, the "minor" highway authorities will no doubt have something to say as to the suggestion that the county councils should act as their agents in the matter. The next proposal of the association is certainly an excellent one. It is that for each county a map should be prepared by the county surveyor, in consultation with the surveyors of the minor highway authorities within the area, distinguishing the roads which are new routes within the meaning of the Act from those which were regularly used by omnibuses before the passing of the Act, and also showing which roads are in their opinion capable of carrying omnibus traffic. The value of this proposal lies in the circumstance that many omnibus routes traverse the districts of more than one highway authority. The next resolution emphasises the desirability of fostering good feeling and establishing a right understanding between omnibus owners and highway authorities by suggesting that, as far as possible, efforts should be made by county councils to get the owners of omnibuses to co-operate by friendly arrangements, rather than by the enforcement of the legal position, as to the routes which their vehicles shall use. This, of course, is the spirit in which the Act should be administered, and the general power which is given to highway authorities to attach conditions to their consent to the use of new routes ought greatly to facilitate the carrying on of negotiations.

We are not quite clear as to the meaning of the final resolution that a "consent" under the section may properly include the condition that a reasonable fee shall be paid by the omnibus proprietor. Presumably there is no general objection to the conditions imposed providing for a money payment to be applied to the upkeep of the roads, but it is surely open to doubt whether a "fee" in the strict sense of the word can be charged. In regard to contributions towards the maintenance of the roads, the opinion has been expressed by the Lancashire County Council that so very little could, in any event, be obtained under this section in the way of compensation from the motor owners for damage they do to the roads, that it is not worth consideration, especially as the Act is only temporary in its operation. With this view, however, we hardly agree. It must be remembered that highway authorities now have a unique opportunity of enforcing the principle involved—an opportunity which should not be allowed to pass unheeded. As regards the rate of payment, this must, of course, primarily depend upon the character of the road; and the following scale, drawn up by an expert for the official gazette of the association, and reckoned on the assumption of 100 miles a day, should at least afford a basis for discussion:

		Per 'bus per mile.	Per 'bus per annum.
		d.	£ s.
(*a*)	Specially constructed wood paved or asphalted road on reinforced concrete ...	$\frac{9}{8}$	57 0
(*b*)	Wood-paved road (on concrete)	$\frac{7}{10}$	66 10
(*c*)	Asphalt road (on concrete)...	$\frac{7}{10}$	66 10
(*d*)	Granite sett or Durax paved road (on concrete)	$\frac{7}{10}$	66 10
(*e*)	Asphaltic macadam road	$\frac{1}{2}$	76 0
(*f*)	Tarred slag macadam road	$\frac{3}{4}$	114 0
(*g*)	Tarred limestone macadam road	$\frac{3}{4}$	114 0
(*h*)	Tarred granite macadam road	$\frac{3}{4}$	114 0
(*i*)	Granite water-bound road	1	152 0
(*j*)	Limestone water-bound road	1	152 0
(*k*)	Other water-bound road	1	152 0
(*l*)	Partly wood-paved and partly macadamised with water-bound metalling	$1\frac{1}{10}$	104 0
(*m*)	Partly wood or granite paved and partly macadamised with water-bound metalling	$1\frac{1}{10}$	104 0
(*n*)	Partly paved with wood and partly macadamised with tarred macadam... ...	$\frac{9}{10}$	86 0
(*o*)	Partly paved with setts or Durax and partly macadamised with tar-macadam ...	$\frac{9}{10}$	86 0
(*p*)	Partly wood-paved and partly paved with setts or Durax	$\frac{7}{10}$	66 10
(*q*)	Partly paved with wood and partly with asphaltic macadam	$\frac{1}{2}$	76 0
(*r*)	Partly paved with granite setts, or Durax, or partly with asphaltic macadam or Lithofalt	$\frac{1}{2}$	76 0

It would be interesting to hear the views of our readers on the scale suggested.

Housing in Liverpool.

The activities of the Liverpool Corporation in recent years with regard to the clearance of slum areas and the demolition of insanitary houses have been on so large a scale, and the improvements that have been effected are so striking, that the question of what the conditions were before this great work was undertaken naturally suggests itself. From a very interesting article by Dr. Hope, the city medical officer of health, which appears in the current issue of the *Journal of State Medicine*, it seems that the exceptional sanitary difficulties that have had to be surmounted are due to two main causes. One is the geographical position of Liverpool as the great link between the Eastern and Western worlds, and the other is the extremely rapid commercial development of the city at a time when sanitary science, if not unknown, was impossible to apply —the result being the crowding together of squalid habitations into the narrowest possible compass, as well as burrowing into the earth to construct cellar dwellings. Some idea of the critical situation with which the corporation have had to deal may be gathered from the fact that in the early 'sixties there were occupied not less than 22,000 insanitary houses and about half that number of cellar dwellings. To deal adequately with the problem thus presented, special legislation has been necessary, and special sanitary powers have been obtained from Parliament on many occasions, the provisions of the Liverpool local Acts having in some particulars paved the way for subsequent general legislation. The nett result has been the demolition of no fewer than 20,000 insanitary houses and the almost total abolition of the cellar dwelling. In addition to this, a large number of houses have been dealt with by closing orders under the Housing of the Working Classes Acts.

Operating on such a vast scale, the problems of re-housing have had to be kept constantly in mind. The earlier policy of the corporation was not themselves to build, but to rely on wholesale demolition acting as a stimulant to private enterprise—a policy which has been justified, in part, at all events, by the erection by private enterprise during the last twenty years of some 22,000 houses. But the corporation, through its Housing Committee, has been faced with the difficulty of providing for those who appeared to be too poor to pay even a moderate rental, and who, at the same time, from the necessities of their precarious and uncertain dock labour, required to live near the docks, and they adopted the policy of making provision for the re-housing of families of this class whom they dispossessed, or who were dispossessed on sanitary grounds by the Health Committee. As Dr. Hope points out, however, a great many of the dispossessed would prefer to go elsewhere; others, of irregular habits (drunken and disorderly), clearly could not be accepted as tenants, or, if they were accepted, their tenancy was not of long duration; but a very great work has been accomplished by making adequate provision for the average labouring family, which cannot afford a high rental. This provision comprises not merely a habitation—it involves the provision of all necessary sanitary appliances, the later series of dwellings having been furnished with baths, and, not only that, but also supplies of hot water. Furthermore, the schemes have made provision for playgrounds and open spaces for the aged and young, and in every case where it was necessary the widening and opening out of the principal streets.

What, it may be asked, are the material results of these vast schemes? In the first place, practically all the slum areas have been swept away, and in their place are found decent healthy tenements, situated in wide streets, with plenty of air space and playgrounds for the children. Further, Dr. Hope states that typhus fever has wholly disappeared, and other zymotic diseases have very greatly diminished, while at the same time the habits of the people are vastly improved, and there has been a remarkable decrease in squalor, drunkenness—and what is perhaps most important—child neglect. Truly a remarkable record, and one of which the corporation and their advisers have every reason to be proud.

* * *

Highway Obstruction: Liability for Accident.

The recent decision of the House of Lords, allowing the company's appeal in the case of *Hewlett* v. *Great Central Railway Company*, will, we venture to think, come both as a surprise and a disappointment to those who looked upon the decision of the Court of Appeal (thus reversed) as an illustration of a well-established principle—viz., that any one who places a dangerous thing upon a public highway is bound to take all reasonable precautions for the protection of all persons using the highway, and that if he omits to do so he will be liable for the consequences. It will be remembered that this was an action by a taxi-cab driver for damages for injury to his cab by colliding, after dark, with a gate-post at the entrance to Marylebone Station. The gates and posts had been erected by the company without authority, but they had subsequently obtained a private Act of Parliament authorising them to maintain these obstructions. The Act contained no provision as to lighting, and the street lighting was carried out by the Marylebone Borough Council, but it was considerably diminished in consequence of the regulations made under the Defence of the Realm Consolidation Act, 1914. The Court of Appeal held that the company were liable on the ground that, although the private Act gave them authority to maintain the gates and posts, it did not absolve them from the duty of taking reasonable care for the protection of the public in the circumstances from time to time arising. So far as we can gather from the judgment of Lord Parker in the House of Lords, that House would appear to have taken the view that no such duty existed. After referring to the well-settled principle that those who exercise statutory powers must use reasonable care to prevent any injury which was likely to be occasioned by their exercise, his lordship said that the only statutory power the company could be said to have been exercising was the power to "maintain" the gates and posts. "What," he continued, "was the meaning of the word 'maintain' as there used? Negatively it released the company from any obligation which might otherwise have existed to remove the posts; positively it enabled the company to do what was necessary to keep the posts there. It was only in its negative aspect that the company could be said to have exercised this power. It had in fact done nothing at all. In his opinion the principle relied on had no application in such circumstances. For it to be applicable the company must be doing something involving risk to others without taking reasonable precautions to avoid such risk." Thus the very fact which in the opinion of the Court of Appeal entailed liability on the company—namely, that they "did nothing"—was held by the House of Lords to absolve them from liability.

With the utmost possible deference to so high an authority we would venture to suggest that there is something fallacious in this line of reasoning. It is perfectly true that, so far as concerns precautions, the company "did nothing;" but, as his lordship was careful to state, they did exercise their statutory power of "maintaining" obstructions which, in the absence of such statutory power, would have been an illegal nuisance, and this, surely, was, in his lordship's own words, "something involving risk to others," and it was admittedly done "without taking reasonable precautions to avoid such risks." The distinction

drawn between the "positive" and the "negative" meanings of the word "maintain" appears to us to be somewhat over subtle, and does not appeal to us.

* * *

Diagrammatic Statistics.

The use of charts and diagrams for various municipal purposes is becoming very general. Just as graphic statics are found safer and more convenient in constructional work than mathematical calculations, so do the charts and diagrams show more readily the records and result of the working of any particular department. They enable the surveyor to see at a glance the costs over a number of years, and so detect the weak spots in his work. By paying greater attention to those particular items which indicate a want of supervision, lack of attention, and due regard for economy, he can often materially reduce his working costs. The paper by Mr Reginald Brown on the subject of "Diagrammatic Statistics," which appears in this issue, contains a number of useful diagrams of a standard character which can be applied to the working of the various branches of his department. Thus the charts given in Mr. Brown's paper show the costs graphically for the removal and disposal of refuse, sewage disposal, house refuse collection and disposal, pumping, highways maintenance, scavenging and watering, and baths. A systematic tabulation of results and costs relating to highways and sewers should be found in every surveyor's office. So also should a complete set of plans of his district, kept up to date, showing the positions of all sewers, manholes, flushing tanks and vent shafts, together with a book of sections giving the size, inclination, velocity and discharging capacity of the sewers. Method is very necessary, but one frequently finds it made a hobby which is ridden to death. The numerous reports issued by our Government offices, in the opinion of many men, go into a great amount of unnecessary detail at a great expenditure of time and money, and just recently we have seen these red-tape methods coming in for severe criticism both in Parliament and the Press. Figures are said to be able to prove anything, and in the hands of an astute politician (and we may include many chairmen of municipal finance committees in this category) they are certainly very often made to convey a meaning exactly contrary to that read into them by the man in the street. Charts and diagrams are not open to this criticism, at any rate to the same extent, but even standard charts if not used with due discrimination and a proper regard for local considerations may frequently be misleading. By allowing comparisons to be so readily made between a number of towns, probably differing greatly with regard to the cost of labour and materials, there is a danger that they may sometimes cause trouble to the surveyor. Another difficulty experienced by many surveyors—we might say most at the present time—is that, however desirable they may consider it to be to have these various charts, they are so badly understaffed that they have no time to prepare them. This is particularly so in the smaller districts, where the surveyor's time is fully occupied by the ordinary routine work of his department, making him look upon these charts and diagrams as part of a policy of perfection which can only be carried out with an efficient staff in a large office.

* * *

The Cowlyd Water Board Bill.

An interesting position has been evolved from the Cowlyd Board Bill, which recently passed its third reading in the House of Commons. The Bill in brief provides for the enlargement of Cowlyd Lake. At present the water supply for Colwyn Bay and the other parts of the area of the Conway and Colwyn Bay Joint Water Supply Board is obtained from the lake. Under the powers conferred by the Bill a private business concern will undertake to enlarge and deepen the lake considerably, and will share with the board the additional water thus stored. When the subject was discussed at the Colwyn Bay Urban District Council on Monday night, the chairman, Mr. W. Horton, who is a member of the Cowlyd Board, announced his resignation as a member of the special sub-committee of the body which had charge of the Bill. Mr. Horton's complaint was that his suggestions for the improvement of the Bill had been ridiculed and swept aside. What these suggestions were precisely is not stated, but it is to be inferred from the discussion that they had some relation to the root principle of the Bill namely, the participation of a business concern in the scheme promoted by the Cowlyd Board. At all events, a member, apparently by way of reply to Mr. Horton, predicted that future generations would have occasion to bless the step taken by the board, for it provided ample water for the district if it trebled in size for the next century, and the whole without a penny of expense. On the other hand, it was contended by another speaker that the board had sold its birthright for a mess of pottage, while the clerk of the urban council, Mr. Amphlett, declared that the Cowlyd Board had been very ill-advised in accepting the Bill, and that they had given away the Cowlyd watershed "for nothing." The board, he continued, did not own a drop of water above the present level of the dam. Every drop above that level belonged to the company, who could do as they liked with it. This kind of talk, if it has any real basis, is disconcerting, not to say alarming, and the question may be asked how it should arise as an eleventh-hour warning after the Bill has passed its third reading in the House of Commons. It seems almost incredible that public interests should have been sacrificed to private ends in the wholesale manner here suggested, and we are forced therefore to the conclusion that the judgment of the critics is based upon considerations only remotely connected with the Bill itself.

* * *

Housing in 1915-16.

In another column will be found a summary of that part of the report of the Local Government Board for 1915-16 which deals with the subjects of housing and town planning. The keynote is the restriction of activities in every direction which has been rendered necessary by the war—a restriction which has been generally countenanced, if not directly encouraged, by the board. For example, in regard to the duty of systematic inspection under sec. 17 (1) of the Act of 1909, the board are content mildly to suggest that they trust that local authorities will take all reasonable measures for inspecting and dealing with houses that present an immediate and serious danger to health. It is common knowledge that since the outbreak of war the provision of new working-class housing accommodation either by local authorities or by private enterprise has practically ceased, and a serious problem has in consequence arisen for solution when hostilities cease. In this connection it is at least satisfactory to observe that the matter has been engaging the serious attention of the board for some time. Some loans have been sanctioned during the year under review, but in every case save one the houses to be provided were urgently wanted in connection with war requirements, and in several of them the schemes were the outcome of consultation with the local authorities concerned, undertaken by the board on behalf of the Admiralty or the Ministry of Munitions, who, in view of the extraordinary conditions and the abnormally increased cost of building, secured grants from Imperial funds towards the cost of the schemes. In regard to town planning, too, there has been but little progress.

Housing and Town Planning.

LOCAL GOVERNMENT BOARD REPORT FOR 1915-16.

Part II. of the forty-fifth annual report of the Local Government Board, which relates to housing and town planning, and covers the twelve months ended March 31st last, was issued this week.

Owing to the war there has, naturally, been a very marked diminution in the activity of local authorities generally in housing matters, and the board have not regarded it as expedient, in the circumstances, to undertake much of the work which they would have felt called upon to perform in normal times, or to bring pressure to bear upon local authorities, except in very special cases.

HOUSING INSPECTION.

The board have continued to receive copies of the annual reports of medical officers of health, but in view of the position created by the war it has not been practicable to take such action upon them as regards housing matters as would otherwise have been done in many instances. It has been observed from the reports that in some districts, owing to depletion of staff and other causes, the inspection required by sec. 17 (1) of the Act of 1909 has considerably slackened, and in a few cases has ceased altogether. Although the board recognise that a reduction in the number of houses inspected was, in the circumstances, inevitable, and that it is expedient as far as possible to avoid resorting to the making of closing and demolition orders, they trust that local authorities will take all reasonable measures for inspecting and dealing with houses that present an immediate and serious danger to health.

IMPROVEMENT SCHEMES.

As regards action in respect of improvement schemes under Part I. of the Act of 1890, the report says:

"The clearance of insanitary areas under the provisions of improvement schemes necessarily involves the acquisition of a considerable amount of property, frequently including trade interests and property not in itself of a specially insanitary character as well as much that is insanitary, and it is usually therefore an expensive process. It may be stated generally that, in response to the appeal of the Government for the restriction of the expenditure of local authorities within the narrowest possible limits, schemes of this nature which are in course of execution and which cannot, having regard to the existing obligations of the authorities concerned, be altogether suspended are being proceeded with as slowly as is practicable."

LOCAL AUTHORITIES' RETURNS.

Although application was made as usual for the account which every local authority is required by sec. 44 of the Housing of the Working Classes Act, 1890, to submit annually as to its proceedings under Part II. of that Act, and for the statement which the board usually obtain at the same time as to action taken by the authorities under sec. 15 of the Housing, Town Planning, &c., Act, 1909, it was felt that the information could not reasonably be pressed for. As a result, in nearly 300 cases the account or the statement in question was not received, and any useful comparison of the figures with those for former years is therefore out of the question. The particulars furnished by the remaining 1,500 authorities, however, show that during the year ended March 31, 1915, no fewer than 42,728 houses were satisfactorily repaired after notice under sec. 15 of the Act of 1909, 13,603 houses in respect of which action had been taken under sec. 17 of that Act were made fit for human habitation by the owners without the issue of closing orders, and 2,775 houses were made fit by the owners after the issue of closing orders. With a view to economy, and having regard to the circumstances prevailing, the board have decided not to ask for the account and statement in question in respect of the year ended March 31, 1916.

EFFECT OF THE WAR UPON BUILDING ENTERPRISE.

In their previous report the board pointed out that, speaking generally, the war had necessitated the postponement of the provision of working-class dwellings by local authorities, and that the shortage of labour, the increased cost of certain building materials, and the increasing difficulty of financing building operations had at the same time tended to restrict the building of such dwellings by private enterprise. Since that report was written the restrictive effect of the war on building has become still more marked, and it is feared that in many districts in England and Wales there exists, or will exist on the conclusion of the war, a very serious need for additional accommodation for persons of the working class. The provision of this accommodation will involve difficult problems, and the matter has been engaging the serious attention of the board for some time.

During the year under review the board sanctioned the borrowing by twenty-four local authorities of sums amounting in all to £502,904, for the purposes of Part III. of the Act. Of this, £5,171 represented the total of small loans sanctioned to fifteen local authorities for the purpose of meeting excess expenditure on schemes which had been already executed or of defraying expenses actually incurred in connection with the acquisition of land or the preparation of schemes subsequently postponed on account of the war. As regards the remainder of the total amount sanctioned, £462,930 was required by six urban authorities for the purchase of approximately 108 acres of land and the erection of 1,917 houses or tenements, and £34,803 by three rural district councils for the purchase of some 14 acres of land and the erection of 154 houses. The rent proposed to be charged varied from 4s. to 13s. 6d. per week.

In all of these nine cases, except one, where a small loan of £800 was sanctioned under special circumstances to a rural district council early in the year, the houses to be provided were urgently wanted in connection with war requirements, and in several of them the schemes were the outcome of consultation with the local authorities concerned, undertaken by the board on behalf of the Admiralty or the Ministry of Munitions, who, in view of the extraordinary conditions and the abnormally increased cost of building, secured grants from imperial funds towards the cost of the schemes. The amount of the grant varied according to the circumstances of each particular case, but in no case exceeded 25 per cent of the cost of the scheme, and in every instance the contribution was conditional upon the reservation of the dwellings, for a certain fixed period, for the employees in whom the department concerned was more particularly interested.

In one of the cases in which a grant was agreed to be made the scheme has since been abandoned, and the sanctions to the loans have been cancelled. In another instance it was arranged that a firm of manufacturers should contribute £10,000 towards the cost of a scheme for the erection of dwellings.

TOWN PLANNING.

As in the case of housing, so in regard to town planning, the deterrent effect of the war is evident. Many local authorities who had been actively engaged in preparing town planning schemes, or considering proposals for schemes, have been compelled to curtail their consideration of the matter owing to seriously depleted staffs. Although in some respects the time might be regarded as favourable for the preparation of schemes, the board have not considered it desirable to press local authorities unduly to go forward with their schemes; at the same time, they think it is very desirable, in view of probable developments after the war, that local authorities should take every possible opportunity to advance their schemes, in order that when the opportunity for building occurs progress with building operations may not be impeded.

During the year to which the report relates, the board gave authority for the preparation of eighteen schemes by following seventeen local authorities in respect of areas containing more than 40,000 acres of land—namely:—

Corporations (9) (ten schemes): Birmingham, Colne, Croydon, Leeds, Mansfield, Newport (Mon.), Nottingham, Sheffield, Southend-on-Sea (two areas).

Urban district councils (6) (six schemes): Beckenham, Bentley-with-Arksey, Little Hulton, Longbenton, Seaton Delaval, Whitley and Monkseaton.

Rural district councils (2) (two schemes): Grimsby, Wrexham.

In addition to the cases above mentioned there

were under consideration at the end of the year eleven applications by ten local authorities for authority to prepare schemes in respect of areas comprising about 29,000 acres of land.

Corporations (4) (four schemes).—Salford (2,290 acres), Sheffield (142 acres), South Shields (2,454 acres), West Hartlepool (5,332 acres).

Urban District Councils (5) (six schemes).—Bredbury and Romiley (two areas of 3,986 and 164 acres), Cheadle and Gatley (4,232 acres), Earsdon (4,574 acres), Hale (1,010 acres), Southgate (2,980 acres).

Rural District Council (1) (one scheme).—Wrexham (2,251 acres).

In some of these cases authority to prepare schemes has since been given.

Preliminary notices have, in addition, been given under the Regulations by the following twenty-five local authorities with a view to application being made to the board for authority to prepare schemes—viz.:—

Corporations (11).—Birkenhead, Chesterfield, Chorley, Coventry, Derby, Middlesbrough, Ramsgate, Reigate, Sheffield, Shrewsbury, South Shields.

Urban District Councils (10).—Acton, Barnes, Barry, Chiswick, Finchley, Hayes, Hendon, Wembley, Willesden, Wood Green.

Rural District Councils (4).—Doncaster, Eastry, Tadcaster, Warrington.

In a large number of other cases the information in the board's possession would seem to indicate that the consideration of the matter by the local authority has reached a stage practically equivalent to a decision to proceed with a scheme, and in numerous other cases the board are aware that the question of preparing a scheme has been under consideration. In many instances, however, the matter has been deferred during the present emergency.

ROAD SURFACES FOR MOTOR TRAFFIC.

ELECTRIC VEHICLE TESTS.

Last year some interesting experiments were carried out by Dr. A. E. Kennelly and Mr. O. R. Schurmer, of the Massachusetts Institute of Technology, into the properties of various types of road from which the importance of smooth surfaces for motor vehicle operation are emphasised. The tests were made with an electric delivery wagon weighing under half a ton, and equipped with solid tyres, roller bearings, worm drive and differential gearing. Before being placed on the roads, laboratory tests were carried out to determine the mechanical efficiency of the machine, from the battery terminals to the wheel rims, and this proved to be between 70 and 75 per cent. Some of the chief results have been published in the *Electrical World*.

On tar-macadam in good condition and wet the tractive resistance east-bound varied from 27 lb. per ton, at 12 miles per hour to 30 lb. at 15·5 miles per hour; west-bound, the tractive effort varied between 20 lb. per ton at 10 miles per hour and 24 lb. at 14 miles per hour. On an asphalt road in fair condition, the tractive effort ranged from 20 lb. per ton at 10 miles per hour to 24 lb. at 15·5 miles per hour. With the asphalt in poor condition, the tractive effort was increased about 10 per cent. Eliminating the air resistance, a constant tractive effort of 17 lb. per ton was required between 10 miles per hour and 15 miles per hour on asphalt pavement.

On wood block paving in good condition the tractive effort ranged from 22 lb. per ton at 10 miles per hour to 24 lb. at 14·5 miles per hour. In general, eliminating wind effect, the resistance of wood block paving was about 15 per cent greater than that of asphalt. Brick paving in good condition showed a slight increase in resistance over the wood blocks, and with the bricks slightly worn the resistance ran up somewhat higher. Tar-macadam in good condition showed about the same resistance as an ordinary water-bound macadam with a fine surface in good shape. A 50 per cent increase resulted from a macadam road in poor condition through holes. The resistance of heavily-oiled macadam roads was rather high, and between 7 and 13 miles per hour on a freshly-tarred soft road the resistance varied between 32·5 lb. and 35 lb. per ton.

Gravel and cinder roads showed about 10 or 15 per cent more resistance than good macadam. Granite-block paving proved to be the worst road for mechanical traction, a road of this type on a concrete base, but with sand and gravel interstices, showing two and a half times the resistance of asphalt or wood blocks, the resistance of a granite block road with cement joints being about 60 per cent greater than that of asphalt. With a granite road the resistance increases with speed when the still air resistance is eliminated due to impact resistance. Asphalt, as stated, gives a straight-line curve of tractive effort and speed between 10 and 15 miles per hour.

The results, it is pointed out, generally confirm previous experience, and it would be interesting to extend them to cars fitted with pneumatic tyres, the results from which would no doubt be better on the granite-block paving than were obtained with solid tyres.

RAND WATER BOARD.

VAAL RIVER SUPPLY: A MODIFIED SCHEME.

The original Vaal River Scheme, adopted by the Rand Water Board in 1913, and of which a description appeared in THE SURVEYOR of December 24th last, provided for the erection of a barrage to impound a quantity of water sufficient to supply 20,000,000 gallons a day for the Board's purposes. It was proposed, however, to take, in the first instance, only 10,000,000 gallons daily, and the plans and estimates originally framed by the Board's Chief Engineer, Mr. W. Ingham, M.INST.C.E., M.I.MECH.E., included the plant and machinery necessary to deal with that quantity of water. The estimated cost was £1,250,000, of which £1,146,707 was for engineering. The estimated working costs were 4·376d. per 1,000 gallons, or a total, including the annual fixed charges, of 8·965d. per 1,000 gallons pumped to the Rand.

The preliminary arrangements in connection with the commencement of the scheme referred to above had been made by July, 1914; the outbreak of the European war on August 1st following, however, made it quite impossible for the Board to raise a loan. The immediate accomplishment of the Board's purpose having been thus defeated, the important question shortly afterwards arose what measures, if any, could be adopted to prevent the difficulty likely to be experienced in keeping pace with consumers' demands during the war period, and until a loan could be raised and the Vaal River scheme completed. During the three previous years the rainfall on the Rand and in the Transvaal generally was very scanty, and on many occasions during that period the interests of the towns and mines supplied by the board suffered severely, owing to the inability of the board to meet their full requirements. In order to prevent a recurrence of this undesirable state of affairs, investigations have been carried on with the object of obtaining further temporary supplies, as an insurance against a shortage, during the late winter and early summer months of each year. Out of these investigations arose a proposal to borrow from the board's redemption fund sufficient money to construct a modified Vaal River scheme, which would provide such a supply of water as would be likely to secure the board's consumers against a shortage for some years to come. On enquiring further into this proposal from the engineering, financial and legal points of view, it was found practicable and was adopted by the board in March last, subject to certain minor reservations.

This modified scheme provides for the erection at the Lindique site of the barrage designed in connection with the original Vaal River scheme for impounding a quantity of water sufficient to supply 20,000,000 gallons a day, but it is proposed only to instal plant and machinery for pumping and otherwise dealing with a first instalment of about 5,000,000 gallons a day.

ESTIMATED COST.

The cost of this modified scheme, as estimated by the chief engineer at the prices ruling in November, 1915, is £770,843, including interest on cost during construction, about £39,000; an amount of £13,000, the value of pipes in stock; and approximately £42,000 already expended on the collection of data, legal and Parliamentary expenses, the erection of measuring weirs, and on other minor works and services classified under the head of preliminary expenses.

The annual working cost for the scheme is estimated at 4·6d. per 1,000 gallons, as compared with 4·376d. per 1,000 gallons for the 10,000,000 gallons per day scheme.

Diagrammatic Statistics for Municipal Engineers.*

By REGINALD BROWN, M.INST.C.E., M.I.MECH.E., F.S.I., F.R.SAN.I., Surveyor and Engineer to the Southall-Norwood Urban District Council.

The author puts forward this paper with a certain amount of hesitation, as the subject is too wide to be dealt with as fully as it deserves in a small compass, but he offers no apology for introducing it for discussion among his colleagues, as it is a subject which is of interest to the whole of the profession, and probably no more suitable time can be found for its presentation than at an annual meeting of the institution.

The use of diagrams or charts to show at a glance the records and results of any particular department is invaluable, as by their use it is possible to gain a considerable amount of information with greater facility than by comparison of mere figures only. Such a method also enhances collective information, because of the facility in detecting inconsistencies requiring remedy.

To the individual municipal engineer the use of charts in his own work must, to say the least, be of benefit; but if standard charts could be devised by which comparisons with other towns could be made, possibly their value would be much increased, especially if the information contained therein is combined with the knowledge of the conditions under which the chart has been produced.

Unfortunately, there is a total absence of a set of general standard charts in the municipal engineering profession, but it does not stand alone in this respect by any means.

It would make this paper too long to put before the members the whole series of charts, &c., designed and used by the author for record purposes, and he must therefore content himself with dealing with the subject in somewhat of a general manner, giving a few examples showing how information can be conveyed pictorially, and trusts that quite sufficient will be said to form a basis for destructive and constructive criticism.

GENERAL.

The author has been in the habit for many years—and he is not alone in this respect—of keeping an accurate record of the costs incurred in the various branches of his department, and consequently can at a moment's notice ascertain how and why the costs have varied from year to year. This not only necessitates—in showing the particulars pictorially—the main headings for each year, but also charts for each heading containing the items making up the total of the heading, and although this involves a certain amount of labour, the advantages gained more than compensate for the trouble taken.

As an example of his meaning, the author has (in Fig. 1) selected certain divisions of his department and given the comparative costs, &c., for five years, not only in chart form, but combined with detail figures—a combination which he considers to be of greater value than a mere chart or figures only. A glance at such a chart as this will direct one's attention to the abnormal increase or decrease in expenditure in any year in any particular department, and will cause the municipal engineer to inquire further the reasons of such increase or decrease.

The author has chosen, at random, removal and disposal of house refuse (dusting) and sewage disposal as examples of the information which can conveniently be shown by charts, it being understood that other departments can be treated in a similar manner.

DUSTING.

As previously stated, to read a chart properly one must understand the conditions under which the chart has been constructed. Thus, in the author's district, the work of "dusting" is carried out on the principle of "direct labour and contract." The district is divided into five sub-districts, which are attended to by two men and horse and cart. One of the men is employed direct by the council, which provides a "two-yard" covered cart, the other man with horse and harness being provided under contract at a "rate per day." The refuse is carted to shoot, but this matter is referred to hereafter in discussing details.

Chart 1 shows there has been a great increase in the cost of this work during the five years under review, but does not convey any idea of the items which have caused the increase. To do this Chart 2 is

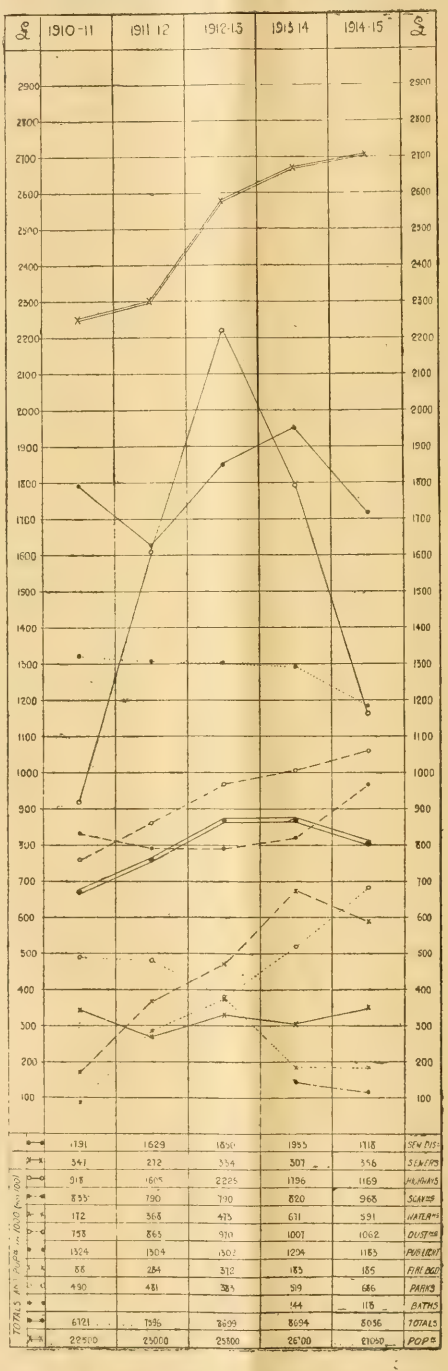

Fig. 1.—Showing Costs of Various Departments.

*(Paper submitted at the recent annual meeting of the Institution of Municipal and County Engineers at Blackpool.

required, and this at a glance will show that the increase has largely taken place in two items—viz.,

	1910-11	1911-12	1912-13	1913-14	1914-15
LABOUR	212	236	215	206	208
HORSE HIRE	396 (11)	447 (9)	501 (6)	587 (9)	658 (10)
DUST BINS	99	58	106	88	69
DUST SHOOT	37	77	105	101	104
MISC.	14	45	44	24	23
TOTAL	758	863	969	1007	1062
POP.	22500	23000	25800	26700	27050
LOADS (¼ YARD)	3553	3618	3868	3967	3995
COST PER HEAD	1·93	1·96	2·00	2·04	2·42
COST PER YARD	22·25	26·16	24·09	27·10	29·72

Fig. 2.—Removal and Disposal of House Refuse.

cost of shoot and horse hire. A study of the items separately will be of interest.

LABOUR.

In spite of the fact that the population has increased, and hence the number of loads removed, the labour item remains practically the same, and the cost of removal on this item is probably carried out as economically as possible under the circumstances. Chart 2B shows that in labour the cost per head of population has been reduced by ·42d., and if represented by yards by ·91d.

HORSE HIRE.

The charge for horse hire has gone up considerably. In 1910-11 the price paid per day for horse and man was only 8s., whereas in 1914-15 it had increased by 25 per cent to 10s (1915-16 the charge is 13s. per day). The effect of this upon the cost of removal is such that—as shown in Chart 2B—the charge per head of population and per cubic yard has increased from 4·22 and 13·37 respectively in 1910-11 to 5·84 and 19·76 respectively in 1914-15.

Obviously, however, this cannot all be due to the charge per day for horse hire, as the rate has only increased 25 per cent. while the cost per yard has increased more than 50 per cent. Hence part of the

	1910 11		1911-12		1912 13		1913-14		1914 15	
LABR	HEAD 2 26	YARD 7 16	HEAD 2 46	YARD 7 69	HEAD 2 0	YARD 6 30	HEAD 1 95	YARD 6 25	HEAD 1 94	YARD 6 25
HORSE HIRE	4 22	13 37	4 70	14 39	4 66	14 15	5 28	17 76	5 84	19 76
DUST BINS	1 05	3 16	60		97		·78		61	
SHOOT	39	1 25	80	2 45	·36	1 11	31	1 09	92	3 12
MISC	01	47	40	1 47	41	1 35	·22	72	21	·69

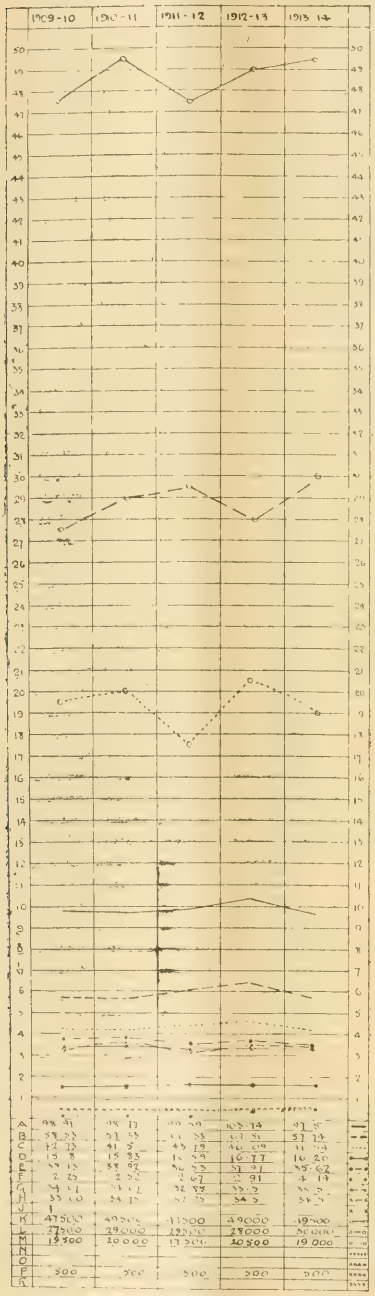
Fig. 2B.

increase is due to some cause outside this—viz., extra horse hire due to longer distance of cartage to shoot. As 3¼d. per yard is paid for "shooting" refuse in a brickfield outside the district, Chart 2B shows clearly it was not until 1912-13 that practically all the refuse was disposed of in this manner, in previous years the shoots being "haphazard" ones. The extra cost of cartage is a very serious one, as it is entirely due to distance of shoot (the ordinary labour being the same) and extra charge for horse hire.

The obvious conclusion is that if the amount is to be reduced some other and cheaper method of collection (cartage) must be adopted, if possible, and the authority carry out the whole work by direct labour. One other interesting fact may be mentioned. The author's authority has for many years past provided portable dustbins to each house at the cost of the general ratepayer. The charts show the cost to be very moderate, the average per head of population per annum being ·80d., or, say, 4d. per house of five persons, and, considering the first cost of the bins to be 4s. 5d. each, the average life of each bin may be taken as thirteen to fourteen years. The actual life of a bin, of course, depends upon the care with which it is used; some bins in the author's district have

been in use more than twenty years, and are still in good condition.

As the number of loads of refuse is carefully



Explanation.

A to F—In pence per load. G—In pence per ton. H—In pence per ton. A to H—Marginal × 10. K to P—Marginal No. × 1,000.

A—Total cost collection and disposal. B—Collection only (including collectors, shooters, horse and stable, proportion of clerks, &c.). C—Cost collection (horse and stable only). D—Cost Collection (B C). E. Cost disposal (all shoots). F—Cost other charges. G—Barge rates. H—Rail rates. J— (——). K—Total loads collected and disposed of. L Total loads collected and disposed of by barge. M—Total loads collected and disposed of by rail. N—Total loads collected and disposed of by destructor. O—Total loads collected and disposed of to chargeable shoots. P—Total loads collected and disposed of to free shoots. R (——).

Fig. 3.—House Refuse Collection and Disposal.

checked, it may interest the members to know the amount of refuse made per head per annum:—

In 1910-11, 8·53 cub. ft.
In 1911-12, 8·63 cub. ft.
In 1912-13, 8 cub. ft.
In 1913-14, 8 cub. ft.

The results are consistent with the growth in population. The author thinks, however, that the slight decrease is due to the gradual increase in the use of the "gas cooker" in the summer and the greater care experienced by the householder in burning all combustible material in the kitchener in the winter months; this is evidenced by careful observation of the class of material removed, and the record uniform number of loads removed each week.

As another and probably better illustration, the

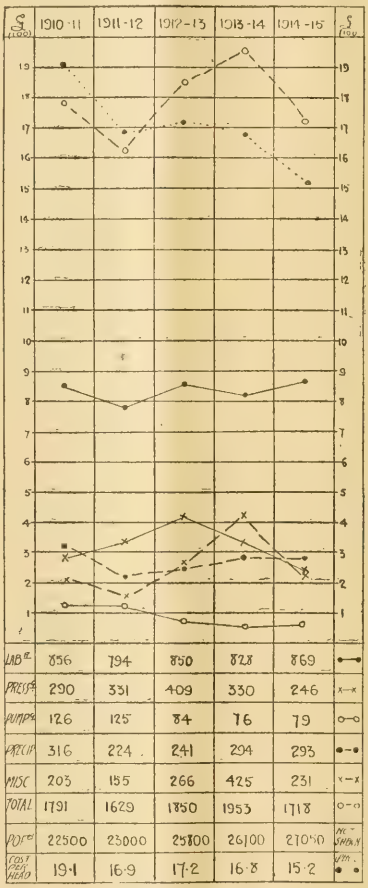


Fig. 4.—Cost of Sewage Disposal.

author is able to give, by the courtesy of Mr. W. Oxtoby, M.Inst.C.E., the borough engineer of Camberwell, a valuable chart (Fig. 3) showing the various particulars relating to house refuse as obtainable in that district. The diagram speaks for itself.

Sewage Disposal.

At how many, or rather at how few, sewage works are proper and complete records kept? And yet how much of a correct understanding of the economical and efficient disposal of sewage depends upon accurate records and statistics. It ought to be possible to know the exact amount of sewage, &c., received at a works and how the whole is treated. To do this efficiently entails a great deal of labour, but when once a system has been adopted and methodically followed the labour is minimised.

In Chart 4 the author gives a "cost" diagram of the main items covering a period of five years, but to show all the details as to the variations in the amounts each year, and their importance, it is neces-

sary to have separate detail charts for each item. Thus the cost of "pressing" in the chart (4) does not include labour, but it includes press cloth, lime used for pressing, and gas used by engine compressor, and the detail diagram would show the proportion of these together with the amount of sludge pressed and the cost per ton, together with other useful information.

Again, as to pumping, in the chart (4) the item does not include labour, but only the cost of the gas consumed (the great reduction is due to the installation of a new, more modern and economical type of engine in 1912-13). A detail chart of pumping operations would also show the number of gallons lifted and the cost per 1,000,000 gallons.

For precipitation the item in the chart (4) includes only the cost of the necessary precipitants—the detail chart would give the cost of each kind of precipitant used, together with the varying prices of same.

There is, however, not only the costs to be considered, but also the necessary records and diagrams showing the working of each department. Under this latter head a few details may not be out of place.

The author has in use a diagram which shows the various known processes of purification of sewage, and as a similar diagram can be utilised to show the method in use at any other works, he offers this suggestion to his colleagues. Such a diagram the author suggests might be in the form shown in Chart 5.

Owing to the difficulty and expense of reproducing colours the chart has had to be printed in black lines and characteristic marks only. (In the original chart colours are used.) Such a diagram shows at a glance the information desired. At the works chosen for illustration the sewage is delivered both by gravitation and pumping. The latter is only a small item, and evidently consists of domestic sewage, with the addition of a small quantity of rain water during storms.

The inflow from gravitation consists principally of domestic sewage, but there is a fair proportion of subsoil water and some trade wastes, and rain water in

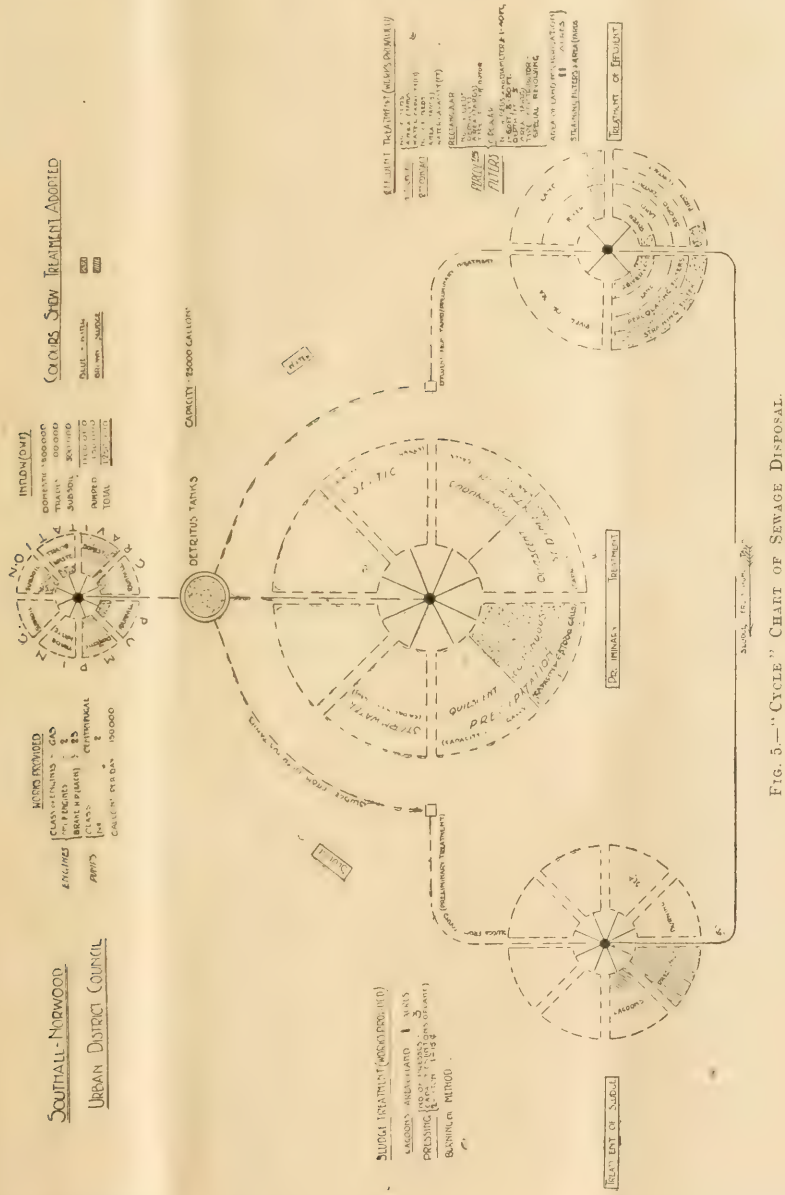

Fig. 5.—"Cycle" Chart of Sewage Disposal.

times of storms. The preliminary treatment is by detritus tanks, continuous precipitation and quiescent sedimentation, the main portion of effluent being treated through straining filters and percolating filters, although small portions are treated through first contact and land, and land only.

The main treatment of the sludge is by pressing.

main items of the treatment adopted. To have proper details, records and charts should be kept showing the rainfall, the maximum and minimum temperatures, the duty of the engines, pumps, &c., the cleansing of the various tanks, the amount of sludge produced, the duty of the filter presses (if any), the flow at various periods and places, the treatment

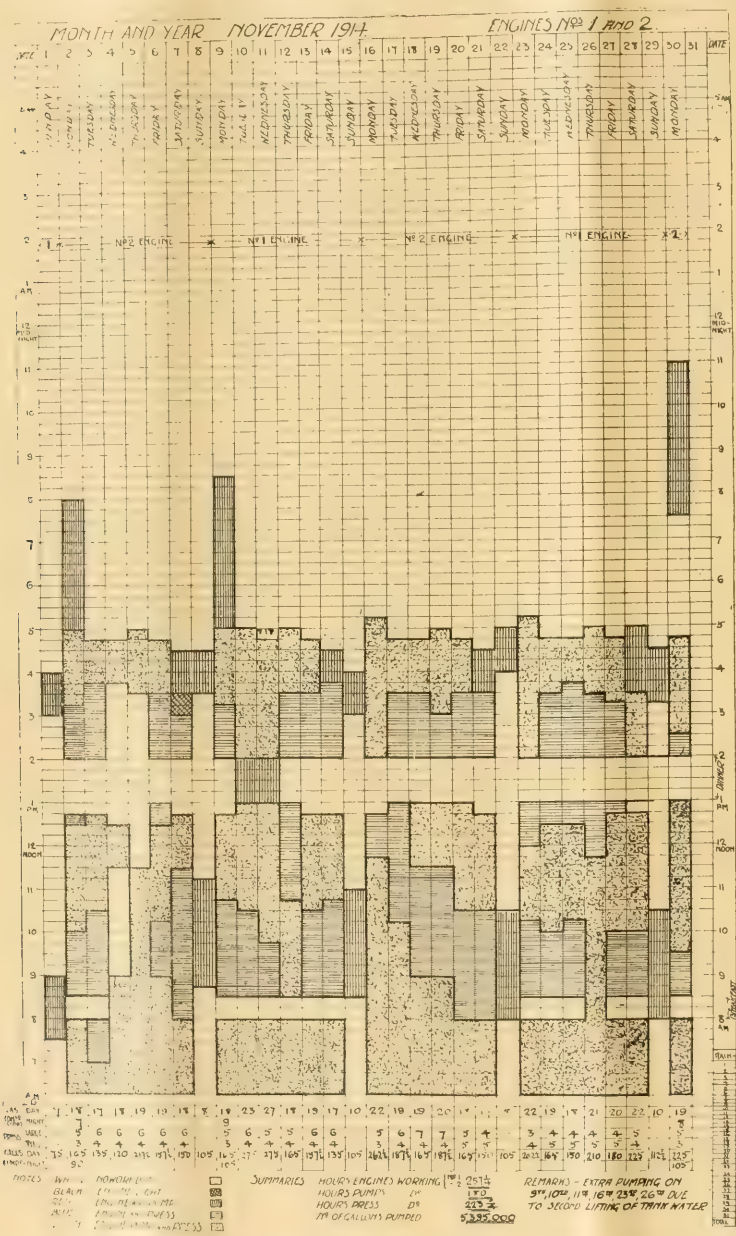

Fig. 6.—Monthly Record of Hours during which Engines, Pumps and Presses are at Work, Gas Consumed, &c.

while a small amount is dealt with in lagoons and on land.

A humus tank is also in use.

From a brief inspection the members will see how the diagram can be made applicable to their own works.

The diagram does not by any means show all the information required in an up-to-date sewage works, and it is not intended to do so, but it does show the

adopted, and the results of the various steps in the process of purification, as well as the final results of treatment before discharge into a stream.

The author gives in Chart 6 a diagram kept by him to show the times of pumping, &c., from which much interesting information may be gained.

SEWERAGE.

Every municipal engineer should, of course, have

a correct plan of the sewers and surface-water drainage of his district, showing the positions of the manholes, lampholes, flushing tanks, flushing valves, vent pipes and such like, together with the sizes and incli-

Fig. 8.—Highways Cleansing, Scavenging, Watering (Mileage, Costs, &c.).

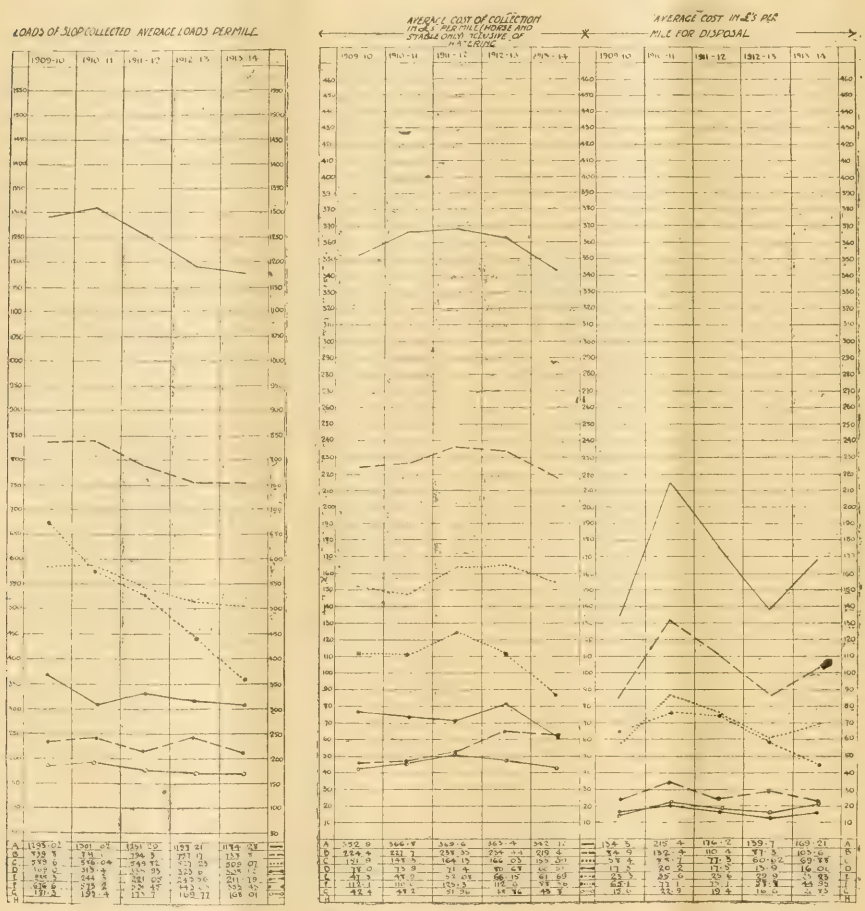
short notice particulars as to any part of the system could easily be ascertained.

For convenience in designing extensions of a system, whether by the local authority or private landowners, a line diagram showing the various sewers, sizes, and discharging capacities when flowing full is of great value, and if kept up to date will indicate at a glance when a sewer is receiving its full quota.

For maintenance purposes a careful municipal engineer will have prepared definite instructions for the order of "flushing," with positions where the flushing operations are to take place to give efficiency with economy, and will have daily reports from the sewer length of sewer, and from the information thus gained an annual diagram could conveniently be devised to illustrate the variations year by year, with explanatory notes as to any excessive expenditure.

HIGHWAYS (MAINTENANCE, CLEANSING, SCAVENGING AND WATERING).

At the present time probably the want of convenient forms in which records should be kept is felt more in highways than in any other department of the municipal engineer; in fact, the Roads and Tramways Committee of the institution ask members to send to the secretary copies of the forms in which they keep their statistics of road upkeep, maintenance,



LOADS OF SLOP COLLECTED AVERAGE LOADS PER MILE

flushers as to which sewers have been flushed, and if any are omitted as to reason of omission, and any defects which may have been noted. Correct daily returns would also be made as to the number of loads or the amount of water used at each flushing station, together with the source of each load or quantity of water used.

When a flushing van is in use it is possible to arrange for very accurate diagrammatic charts to be kept of the quantity of water used from any source. From these records the municipal engineer will be able to set up a diagram to show the cost of flushing operations and how the cost is allocated—against manual labour, team labour or mechanical haulage, water and repairs to plant, week by week—together with the proportionate times actually spent daily by the flushers in travelling and in flushing operations.

Again, as to repairs and maintenance of sewers, all details of expenditure would be kept against each cleansing, watering, tarring, &c., so as to assist them in preparing suggestions for securing uniformity in practice. The type of diagram or diagrams depends upon the information to be contained in the suggested records; but the author cannot forbear reproducing some interesting charts on the lines and from information kindly supplied to him by Mr. W. Oxtoby, M.Inst.C.E., the borough engineer of Camberwell, as specially applicable to highways (Charts 7, 8 and 9).

DISPOSAL OF REFUSE.

No reference has been made in the preceding pages to the use of destructors for the disposal of refuse, and this is intentional, because the many details required to be dealt with would enlarge this paper beyond the time which can be allowed for its consideration.

The analysis of destructor results entails a considerable amount of labour; records have to be kept

of the amount of refuse delivered day by day, the cost of the labour involved in the destruction of the refuse, labour and materials required in the repair and maintenance of the plant, the cost of the various items, the generation and utilisation of the waste heat, the cost of the disposal of the clinker, &c.

Although many valuable results have been published from time to time in the "Proceedings" of the institution, the members will probably agree that they do not convey by any means any very great idea of the comparative value of a particular type. To do this it is necessary for complete and accurate daily records to be kept over a long period; such results must be tabulated on a systematic basis, and consideration must be given to the varying qualities of refuse destroyed in the various types. This is, however, not the time to go into the question of a "comparative" basis—space will only permit of a general *resumé*.

A careful municipal engineer will have records kept of the weight of refuse delivered daily to the destructor; he will also know how many times each cell has been charged and clinkered, and the weight of clinker, ashes and fine dust removed, and how it is disposed of; he will, further, have the labour charges allocated against the various items. Records will be kept of the making and utilisation of the steam (if any) generated from the heat, which would otherwise be wasted, and many other items of interest and value. All these records can conveniently be represented by diagrams.

BATHS AND WASH-HOUSES.

Although baths and wash-houses are not as a rule erected to pay their way, it is always useful to know exactly to what extent the baths, &c., are used, day by day as well as year by year, and also the expenditure on the various departments. Thus, in some districts there are separate establishments of public wash-houses, covered baths (swimming and slipper), or open baths, each of which require different treatment; it is not possible to go into full details.

The author, however, submits the particulars relating to the open baths erected and worked under his supervision. Chart 10 shows the workings for three seasons, the details being obtained from daily and weekly records. The use of the baths day by day during 1915 is illustrated by the diagram exhibited.

Many other forms of diagrams can be utilised by a municipal engineer to assist him in carrying out his multifarious duties. Key plans of a district are very useful in arranging for the collection of refuse, flushing sewers, removal of snow, position of street-name plates, vent pipes, fire hydrants, lamps, &c., a few illustrations of which are exhibited.

FIG. 10.—BATH RETURNS.

FERRO-CONCRETE BRIDGE CONSTRUCTION IN ESSEX.

NEW STRUCTURE OVER RIVER COLNE.

One of the first ferro-concrete bridges built on the Mouchel-Hennebique system for the Essex County Council crosses the river Colne at Colne Ford, Earl's Colne, a pleasantly situated village several miles above the important town of Colchester.

The view reproduced herewith is from a photograph of the finished structure, and gives a good idea of the bridge and the pleasing manner in which it harmonises with a particularly attractive piece of river scenery.

The bridge formerly existing on the same site was a timber structure, and although this was originally sufficient for the traffic requirements prevailing at the time of its construction, the design was not of convenient character, as the bridge formed a very awkward angle with the main highway. Moreover, it was of insufficient strength for modern vehicles, and owing to progressive decay it had become unsafe for use, in spite of all that could be done in the way of repairs and strengthening work.

View of Earl's Colne Bridge.

Consequently the Essex County Council, on the advice of their surveyor, Mr. Percy J. Sheldon, M.Inst.C.E., decided upon the construction of an entirely new bridge in Mouchel-Hennebique ferro-concrete, the initial cost of which is about the same as that of good timber work, and the ultimate cost very much less, owing to the permanent endurance of the material and the immunity it provides from annual maintenance charges.

The old bridge was less than 20 ft. wide, and necessitated a corresponding reduction in the width of the highway, the alignment of which has been much improved since the completion of the ferro-concrete bridge with a width of 30 ft. In addition to the straightening of the main road, the new bridge makes provision for the passage of the heaviest mechani-

cally propelled vehicles at present in use or that are likely to be introduced at any future time.

A trial borehole made for the purpose of ascertaining the nature of the subsoil was carried to a depth of 13 ft. below the surface, with the result that the subsoil was found to consist of loam to a depth of 6 ft.; after this came a 2-ft. layer of clay and mud, and then a deposit of mud to which no bottom was encountered. It was evident, therefore, that special care would have to be bestowed on the foundations of the bridge, but this involved no difficulty in connection with ferro-concrete, which is specially adapted to foundation work in unstable soil.

The bridge proper is 40 ft. long between abutments by 30 ft. wide from parapet to parapet.

Figs. 1 and 2 are respectively longitudinal and cross-sections of the bridge proper. Each abutment is founded on three 14-in. square ferro-concrete piles, which are continued upward as columns, measuring 14 in. by 9 in. in cross-section to the top of the abutment, the columns being monolithic with a continuous curtain wall, 5 in. thick, connected with the wing walls described later. The columns are spaced 12 ft. apart from centre to centre, and between them the wall is stiffened by two rectangular counterforts, each with a cross-section of 9 in. by 6 in. Thus the wall has a series of stiffeners at regular intervals of 6 ft. apart. It is carried at the base by a ferro-concrete footing beam, 16 in. wide by 8 in. deep, supported by the foundation piles, and connected with the wing walls at each end.

The top of each abutment is finished by a coping which is virtually an extension of the bridge decking. The whole of the work described above is reinforced in accordance with standard Mouchel-Hennebique practice, which provides in a scientific manner for resistance to all possible stresses in the structure.

As represented in the longitudinal section, the bridge comprises three spans, 13 ft. 9 in. from centre to centre of the piles, the longitudinal beams being continuous and measuring 8 in. wide by 14 in. deep. They are connected laterally by a series of transverse beams, 6 in. wide by 12 in. deep, spaced 3 ft. 3 in. apart centre to centre, and the decking slab, 7 in. thick, forms a continuous compression flange for the entire series of beams.

Fig. 2 further illustrates the arrangement, showing the cantilever extension of the transverse beams terminated by an outer longitudinal beam at each side of the bridge, the upper part of these members acting as a kerb for the roadway at one side and for the footpath at the other side. The roadway is 25 ft. 6 in. wide and the footpath 4 ft. 6 in. wide.

Fig. 3 is a section of the counterfort at the junction of the lower right-hand abutment and the corresponding wing wall, but may be regarded as typical of all the other counterforts, which differ only in dimensions.

This counterfort is founded upon a 14-in. square ferro-concrete pile, and has a base 3 ft. 9 in. wide monolithic with a 5-in. foundation slab of the same width, and extending for the whole length of the wing wall. The slab is stiffened between the counterforts by a beam or rib, 6 in. wide by 9 in. deep. The counterfort is strongly reinforced by bars projecting from the pile and by other bars and stirrups, as shown in the drawing. The counterfort in question is 10 ft. high, the wing wall being 6 in. thick at the bottom, tapering to 4 in. at the top, where a coping 12 in. wide completes the structure.

The wing walls range from 18 ft. to 28 ft. in length and provide in an effective manner for the support of the new embankments constructed as a part of the road improvement scheme.

On completion of the work the bridge was officially tested under the moving load of two 12-ton steam rollers, which were run across the roadway at various speeds without appreciable deflection, thus demonstrating clearly the strength and rigidity of the construction.

The bridge was designed by Mr. Percy J. Sheldon, the Essex county surveyor, and constructed by the Yorkshire Hennebique Contracting Company, Limited, in accordance with working details prepared by Messrs. L. G. Mouchel & Partners, Limited, of Westminster.

Wanted: A Steam Roller. — Yiewsley Urban District Council have for some time past been endeavouring to purchase a steam roller, but have been unable to obtain one.

Hospital Contractors' Loss.—At the last meeting of Easington, Durham, Rural District Council, the Hospital Committee reported on the subject of the application of Messrs. Christopher Brown, Limited, contractors, West Hartlepool, who built the new infectious diseases hospital, to the effect that a month ago the firm applied for a war bonus of £1,007, owing to their having lost £1,450 on the contract. The committee recommended that the council allow 10 per cent extra on all work which was not completed at the outbreak of the war, and this, it was stated, would amount to £530. The council adopted the recommendation.

Road Improvement Fund.—During the year ended March 31st last £694,395 was received by the Road Improvement Fund from the Consolidated Fund in respect of motor spirit duties and carriage licences. Of this sum £169,354 was balance due in respect of 1914-15, and £525,041 was on account of duties, &c., collected in 1915-16. It is explained in the report of the Comptroller and Auditor-General that under the provisions of sec. 49 of the Finance (No. 2) Act, 1915, any further charges on the Consolidated Fund in respect of the Road Improvement Grant were suspended until Parliament otherwise decides, and the amount of £525,041 represents issues made before the passing of that Act.

Manchester Corporation's Tube Contract.—In the House of Commons last week, Sir J. Lonsdale asked the President of the Board of Trade if he was aware that the Manchester Corporation had been compelled to accept a tender for boiler tubes from a German-owned firm, owing to the fact that these tubes, which were essential to their electricity and gas undertakings, could not be obtained from any other source; if the English works of this German company were a controlled establishment under the Munitions of War Act; and if steps would be taken to extinguish the German interests in this business and place it entirely under British control. The First Commissioner of Works (Mr. Harcourt) said that if the name of the firm referred to was supplied to him he would have the matter looked into at once.

Timber, Plywood and Woodwork.—We would direct the attention of our readers to the full-page advertisement of Messrs. C. Jennings & Company, of Pennywell-road, Bristol, which appeared in our issue of last week. The information given in the advertisement should be of the greatest value to all users of timber, plywood or woodwork. We understand that the firm are prepared to answer any questions relating to the materials of which particulars were supplied, or furnish prices delivered to any part of the world, either of goods mentioned in the announcement or of others not included in it. They inform us that they hold stock at their branches and warehouses at Porthcawl (South Wales), Leyland and Pembroke Dock, Leicester, Swansea, Hull, Liverpool, Manchester, Newcastle and other places, and will be pleased to receive inquiries.

CORRESPONDENCE.

Εἷς ἀνὴρ οὐ πάντ' ὁρᾷ
(One man does not see everything.)
—Euripides.

SURVEYORS' PETROL ALLOWANCES.

To the Editor of The Surveyor.

Sir,—Previous to the outbreak of war I was in charge of an urban district sufficiently compact to be administered without a motor cycle. Some months back I undertook the duties of a rural colleague who has enlisted. I found it imperative to purchase a motor cycle to enable me to travel quickly and keep the work of both districts well in hand.

I applied for licence to purchase 5 gallons of petrol per month, but am limited to two; in consequence my work is restricted.

As with your correspondent, "A County Road Surveyor," the muddle will pay me, as I receive no allowance whatever towards travelling expenses.

I have tried to eke out my supply by diluting with paraffin, but my first attempt was not a success. I am told, and I believe it correct, that I ought to have used the inferior brand of paraffin instead of the best. —Yours, &c.,

Urban Surveyor.

August 11, 1916.

STEAM TRACTORS v. HORSE HAULAGE.

To the Editor of The Surveyor.

Sir,—The above is a subject of great interest. No matter for what purpose the haulage may be, it is getting a difficult business to hire or purchase horses, and mechanical traction will, no doubt, very considerably increase in the future, although it is a generally accepted fact that the mechanical does not favourably compare with the horse for short or interrupted journeys, such as delivery of coal to householders in small quantities, refuse collection, &c.

Looking through the figures given by Mr. H. Hopkinson, cleansing superintendent to the Portsmouth Corporation, I was very much surprised at the figures therein given as to the cost of working a Foden wagon and trailer: Fuel, 4s. 7½d.; wages, 8s. 4d.; total, 12s. 11½d. per day. Evidently the driver and mate collect the refuse, averaging 45 cub. yds. per day, carry it to the wagon, which evidently must be mounted by ladder—and all for 12s. 11½d. I could not get a driver and mate at the wage, and I am certain a driver of a Foden would not combine the occupation of scavenger, whatever the wage might be. My experience of the cost of a 5-h.p. steam tractor at the present time, allowing 15 per cent depreciation, is 28s. 6d. per day, the driver and mate being paid extra for loading trucks in quarry or railway station for shovel work.—Yours, &c.,

Tractor.

August 14, 1916.

SETT PAVING: FOUNDATIONS.

To the Editor of The Surveyor.

Sir,—It has been interesting for me to read the paper on "Improvement of Highways" that the county surveyor of Lancaster read at the annual meeting of the Institution of Municipal and County Engineers, and to notice that it was generally accepted that the success of sett paving depended on rigid foundations.

Will you allow me to say that I was of the same opinion until recently, but when one has seen how well the sand-bedded *pavé* roads in Flanders, laid on clay, have withstood the enormous traffic, one's views are much modified as to the necessity of providing elaborate and expensive foundations.

It may also interest my *confrères* to know that split setts are very rare, in spite of steel-tyred vehicles with heavy loads.—Yours, &c.,

A Municipal Engineer at the Front.

August 10, 1916.

Non-slip Road Surfaces.—A street with a rough surface to prevent skidding in wet weather has been laid in San Francisco. The base is prepared in the same manner as that employed in laying an asphalt street. Hot asphalt mixture of the desired thickness is spread and a quantity of 1-in. broken stone is rolled into the surface. The slight unevenness caused by the projecting points makes skidding unlikely, and furnishes a good footing for horses. Some of the pavement laid three years ago has been so satisfactory that more is being built every year.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Does not the controversy upon the collection of house refuse by petrol-motor wagons resolve itself into this: Given a long non-stop run it pays, if not it doesn't? Is not this reversed in the case of electrically driven motor vans—viz., frequent stops, and it pays; long runs, especially uphill, and it doesn't? Could not both systems be combined by means of small central depots, and movable bodies raised and dropped into place by an electrically driven crane?

* * * *

Is it a fact that, where concrete is required to set quickly after being placed in situ, it is a good plan to leave it on the banker for about a couple of hours after it has been mixed? Has this been tried anywhere, and, if so, with what results?

* * * *

Will the recent diversion of all the traffic in Park-lane, during repairs, into the Hyde Park road stir up the advisers to H.M. Office of Works to a study of the road question, and be the means of a better and more modern method of construction than has obtained in the past? Is it not to be hoped that the motto "It is an ill wind that blows nobody any good" will be effective in this case?

* * * *

Should not every surveyor, and, indeed, every councillor, read Mr. H. G. Wells' book "What is Coming," from page 77 to page 82 inclusive, if he desires to study a layman's views on the municipal muddle that pervades this country? Should not the inhabitants of the villages of Bocking and Braintree in Essex feel very proud that these two places should have been selected by Mr. Wells for his sarcastic remarks?

* * * *

Were there not in a recent number of *Engineering* some very practical suggestions on the education of engineers, in which it was pointed out that those engaged in the engineering industry might be divided into two classes—the "workers" and the "thinkers"? Was it right, however, to suggest that the same training is not the best for both, although it was allowed that many of our ablest engineers have risen from the ranks? Is not a practical training almost essential for an engineer, whether civil or mechanical, up to a certain point or age, followed by a sound technical university training for those who are to develop into the "thinkers"?

* * * *

Is it not rather interesting to note that a somewhat complicated situation has arisen in connection with the Daylight Saving Bill at Oldham, where the consumers of electric current are charged a flat rate of 4½d. per unit up to 10 p.m., and 2d. per unit after that hour, and that the town council, who supply the current at these rates, did not alter the meter clocks to meet this contingency, so that consumers are charged for an hour more at the extra rate than they would have been if the clocks had been altered? What are the consumers going to do under these circumstances? Will they grin and pay, or refuse to do so and let the council proceed against them for payment?

* * * *

Why has it been left to the *Engineering News* of New York to call attention to the need of a proper definition of a large number of engineering terms, and to suggest the formation of a technical committee which should undertake the production of a reliable engineering dictionary? Is not such a dictionary greatly wanted in this country also?

* * * *

Is it at all a matter of surprise that a dictionary should be sometimes wanted to explain the meaning of some of the complicated words used by medical officers of health in their reports, in order that members of the council should understand them, and reporters spell them properly? Was it not rather amusing, however, to read the other day in the local Press that at a meeting of the Norham and Islandshires, Northumberland, Rural District Council there was something of a dispute as to whether a dictionary had been ordered or not for this purpose, and that the medical officer of health finished the discussion by saying: "Very well, if there is no dictionary I shall proceed with the report"? What was the inner meaning of this dire threat?

Law Notes.

EDITED BY J. B. REIGNIER CONDER, Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary copies of local Acts or documents referred to should be enclosed.* All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. *Unless these conditions are complied with we cannot undertake to reply to queries.*

ISOLATION HOSPITAL POWERS OF COUNTY COUNCIL. — The decision of the Court of Appeal in *Attorney-General* v. *Derbyshire County Council* has been affirmed by the House of Lords. The question at issue was the extent of the powers of the council with respect to the constitution of the committee of an Isolation Hospital under the Isolation Hospitals Act, 1893, and 1901. The council in 1907 made an order creating a united district for the purpose of establishing the hospital, and determining the representation on the committee of the council and the local authorities. In 1914 differences arose between the council and the Barlow and Bulmell Urban District Council one of the local authorities in question on questions of policy, in consequence of which the county council made a further order varying the constitution of the committee by increasing the number of their own representatives to nine and reducing that of the urban district council to half a member, thus giving themselves such an absolute majority on the committee that they could entirely control its policy. It was held that this order was not *ultra vires*, inasmuch as the county council had power at any time, provided they directly contributed to the funds to be administered (which they did), to dissolve the committee and create a new one, and to vary the representation thereon by reducing that of the local authorities and increasing their own.

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as noms de plume. *The letter* X, *combinations such as* X.Y.Z., *and words such as* "engineer" *and* "surveyor," *should never be used.*

MATERIALS FOR SURFACE REPAIR. QUARRYING AND LORDSHIP.—"C. B. M. B." writes: (1) Will you kindly give me your definition of the words "inclosed land" in the following clause of sec. 80, Schedule C, Roads and Bridges (Scotland) Act, 1878: "And carry away any such materials in or out of the inclosed land of any person where the same may be found," a question having arisen as to quarrying on the side of a certain road across which there are several gates which form part of the division fences between farms, or between farms and woods, the fences and gates being upkept by the proprietor or tenants. The road runs north and south, the division fences running at right angles to the road from a wall or fence on the east to the sea on the west. At certain points the road is fenced next the sea, but in the case under review the road runs through a wood with a gate at each end, there is no fence along the shore, nor is the road fenced off from the wood, though the wood as a whole is fenced on three sides. The owner of the wood contends that the wood is "inclosed land" within the meaning of the Act, while, on the contrary, it is stated that, as the wood is open to the public road there being no fences along the roads the land is therefore not "inclosed." (2) There is also a question as to "stone to be used for building" in the same section of the Act. One party maintains that lordship can only be charged for stone actually used for building walls, bridges, houses, &c., and not on stone, however suitable for building purposes, which is broken into metal and used for surface repair; the other that all "building stone"—*i.e.*, suitable for masonry, whether used for building or broken up into metal—can be charged for.

(1) I am not aware of any authority on this point, but in my opinion the wood is not "inclosed land" within the meaning of the Act. In England the meaning of the expression "inclosed land," as used in the Highway Act, 1835, sec. 73 (which requires notice to be given to the owner of "inclosed land" before materials are taken), was to some extent elucidated in the Exhausted Parish Lands Act, 1841. That Act provides that land in the exclusive occupation of one or more person or persons for *agricultural* purposes is to be deemed to be "inclosed land" within the meaning of the Act of 1835, although the same may not be separated from any adjoining lands of other persons, or from the highway, by any fence or other inclosure. These Acts do not apply to Scotland, however, and, in the absence of any authority to the contrary, I think "inclosed land" in the Act of 1878 may be taken to mean land inclosed on all sides. (2) I do not think that stone actually broken up into metal and used for surface repair can reasonably be held to come within the description of "stone to be used for building," even though it may be suitable for building purposes.

WORKS: BUILDING BY-LAWS.—"H. C." writes: In this district there are iron and steel works, chemical works, &c., and from time to time extensions, alterations and additions are made—for instance, at the iron and steel works extensions of the furnaces, new sets of boilers and plant, alterations of workshops, and the roofing in, &c., of machinery and plant. Some of the work is of a permanent character, other including roofs carried on stanchions and wooden lean-to sheds against existing buildings, &c., and occasionally a building is moved to another part of the works to allow for extensions of machinery, &c. At the chemical works new stills and large boilers and tanks are erected on concrete piers for storage and in connection with the process of distillation. I cannot find that any plans have been submitted. Is it necessary for plans of these extensions, alterations, &c., to be submitted to the council? The by-laws can hardly be applied to works of this nature.

I do not think it is necessary to submit plans of boilers or tanks; see *Grey* v. *Black Lion Brewery Company* (55 J.P., 711); but plans should be submitted of any alterations or additions which are of such a nature that they constitute the erection of a "new building." If sec. 23 of the Public Health Acts Amendment Act, 1907, is in force in the district the following would constitute the erection of a "new building" viz., raising any part of the roof, altering a wall, or making any projection. In order to be a "building" within the meaning of the by-laws a structure must contain some feature contemplated by, and dealt with in, the by-laws. See *Slaughter* v. *Sunderland Corporation* (60 L.J.M.C., 91).

CINEMA: BUILDING BY-LAWS.—"C. H." writes: Plans have been submitted for a proposed cinema. Very little information is given of the construction of the iron roof principals and gallery—in fact, it is only after discussing the plans with the architect that one knows how it is proposed to construct the gallery, as the plans might mean anything. I asked for detailed information to be shown on the plans, such as thickness of connection plates, mode of jointing and fixing the roof principals, and similar information regarding the gallery, when I was informed that it was not necessary to supply it, and I could not demand it. Our by-laws do not deal with iron roofs or galleries. I shall be glad to have your opinion and advice.

Under by-law 104, "complete" plans and sections of "every floor" of an intended building are to be delivered, which are to show "the position, form, and dimensions of the several parts of such building." From what is stated as to the plans submitted in this case it would appear that they are very far from "complete." I think the details asked for ought to be given. I would point out that, under by-law 67, rule (10), in the case of a roof covered with (*inter alia*) iron, the timbers of the roof must be of such size and strength as may be adequate to secure due stability.

REFUSE TIP: COMPULSORY PURCHASE. "Bishwith" writes: The rural district council have endeavoured to lease land for a refuse tip, but the owner refuses to lease or sell the land. Can the council take the land by compulsory purchase for the purpose of a refuse tip?

Inasmuch as the council are authorised by sec. 113 of the Public Health Act, 1875, to provide receptacles for the temporary deposit of refuse, it would appear that they can acquire land compulsorily for this purpose under secs. 175 and 176 of that Act. A Provisional Order of the Local Government Board would have to be obtained before the compulsory powers could be exercised.

We have to draw the attention of querists to the directions laid down for their guidance in regard to the preparation of diagrams. Rough sketches obviously cannot be made use of, and we should be obliged if correspondents would therefore send only carefully-prepared drawings, preferably about 6 in. in width, and without colouring or wash of any description. Failure to observe these rules will involve the risk of queries remaining unanswered.

AN AMERICAN ELECTROLYTIC SEWAGE DISPOSAL PLANT.

"TOO EXPENSIVE AND UNCERTAIN."

A final report to the Board of Estimate and Apportionment, City of New York, on the Landreth electrolytic sewage disposal plant at Elmhurst, Long Island, has just been made by the City Board of Consulting Engineers (made up of the chief engineers of the Board of Estimate and Apportionment and the consulting engineers of the several boroughs of the city). The board considers the continued use of this plant as too expensive and uncertain, and recommends the temporary use of chemical precipitation and sludge-drying beds at this point pending a permanent connection to projected sewers.

HISTORY OF THE ELMHURST PLANT.

In 1900 (says *Engineering News*) a disposal plant was authorised by the Board of Public Improvements for Elmhurst. It consisted of four settling tanks and three sand filters. On account of the continuance of objectionable odours, in 1914 a small (25,000-gallon) experimental Landreth plant (employing simultaneous lime precipitation and electrolysis) was installed (by the Electro-Chemico Corporation, of Philadelphia). Reports on this machine were made (1) by Messrs. P. M. Travis, chemist, and E. I. Firth, engineer, for the borough of Queens; (2) by Messrs. R. H. Brown and W. T. Carpenter, for the Bureau of Sewer Plan; (3) by Messrs. F. A. Cleveland, for the Bureau of Municipal Research; and (4) by Messrs. E. J. Fort and C. E. Gregory, for the Bureau of Sewer Plan.

A large unit, capable of handling 750,000 gallons per day, was installed in 1915, and two studies have been made on that—(5) one by Messrs. W. P. Mason, J. C. Olsen, C. O. Mailloux, and P. M. Travis, for the Electro-Chemico Corporation; and the other (6) by the Bureau of Sewer Plan, for the Board of Estimate and Apportionment.

There was not entire accord in the results of these investigations. For instance the first (Travis and Firth) report showed a requirement of 144 kw.-hour per 1,000,000 gallons, and 1,257 lb. lime. This electrolytic machine (vertical type) was 24 by 18 in. in section and 7 ft. 3 in. high. The current was split between carbon and steel electrodes, and paddles were revolved between these plates. No great technical skill was required for operation, and no apparent wear was found on the iron electrodes. Immediate coagulation, wonderfully quick settlement and bactericidal action (99·819 per cent) beyond possible action of lime alone was reported. The dissolved oxygen was "considerably increased," and the oxygen consumed by organic matter "enormously reduced."

The later reports (3) were less optimistic. For instance, in the Brown-Carpenter-Cleveland series, time of passage through the machine was given as 2¼ minutes, and the time of filling the sedimentation tank 1½ hours. The previous high bacterial reductions were not repeated (only from 30 to 94 per cent in effluent from the machine, and from 97 to 100 per cent in the settlement tank effluent). The machine was found very sensitive to change in character of sewage. The reduction in total suspended solids was between 65 and 83 per cent. The reduction in suspended organic matter was 3 to 7 per cent in the machine effluent and 38 per cent in the tank effluent. The reduction in consumed oxygen ran from 2 to 95 per cent for machine effluent and 23 to 80 per cent for tank effluent. The increase in dissolved oxygen for these two effluents was 18 to 87 per cent and 53 to 68·5 per cent respectively.

On running the machine with lime only (without current) the chemical results and bacterial reduction in machine effluent were equal to that of regular operation—except in the appearance of the flock and the higher dissolved oxygen content after sedimentation. Without the paddles the flock was formed slower and the bacterial reduction less. No bacterial reduction in machine effluent was obtained in operating with lime added at 375 lb. and 684 lb. per 1,000,000 gallons. On increasing the content to 1,040 lb., the reduction was 72·3 per cent. On 2,210 lb., the reduction was 94·1 per cent. About 17½ cub. yds. of sludge (94 per cent moisture) was formed per 1,000,000 gallons.

The large plant as tested by Messrs. Mason, Olsen & Mailloux employed in order: (1) screening; (2) addition of lime; (3) electrolysis; (4) sedimentation; (5) sludge pressing. The machine was a covered horizontal box, 3 by 2¾ ft. in section and 23¼ ft. long. The flow was between sets of parallel steel plates with paddles revolving parallel to the plates. The maximum values of current supply were 125 volts and 40 amp. The time of flow through the tank was 68 sec. The time in the sedimentation tanks was about 4 hours. With 1,000 to 1,300 lb. hydrated lime per 1,000,000 gallons, the raw sewage and machine and tank effluents showed, for instance, oxygen saturations of 25·5 per cent, 31·8 per cent, and 45·5 per cent, and bacterial counts of 1,100,000, 846,000 and 800.

When lime was used in the machine (1,510 lb. per 1,000,000 gallons) but no current, the machine effluent became darker with smaller flocks. The bacterial reduction in raw sewage and machine and tank effluent was from 210,000 to 11,150 and 61,000 (for the last, bacteria rose to 9,360,000 after standing two days). The percentage of saturation for dissolved oxygen rose from 28·4 per cent to 43·9 and 44·3 per cent; the consumed oxygen in the final effluent was 25·7 per cent.

COSTS.

In regard to costs, for a 1,000,000-gallon plant, Messrs. Mason, Olsen & Mailloux reported: 1,300 lb. lime, $5·14; current, 85 k.w. hours for electrolysis, 60 k.w. hours for agitation, 174 k.w. hours for pumping, and 16 k.w. hours for lime vat, at 4 cents, $13·40; sludge pressing and removal, $5·11; labour and supervision, $12·50; maintenance and supplies, $1; total, $37·15.

On account of the lack of accord of the reports they were all submitted to Mr. Earl B. Phelps, of the United States Public Health Service Hygienic Laboratory, for review and report. His findings were: (1) that the final effluent was highly satisfactory; (2) that the method of sludge disposal was not satisfactory and could not be employed where there was real necessity for sewerage purification; (3) that there was good basis for honest difference of opinion as to whether the electrolysis contributed materially to the results; (4) that the cost was too great to compete under usual conditions with better known processes.

In considering what to recommend at Elmhurst the City Board of Consulting Engineers considered the annual cost per 1,000,000 gallons of the following: Electro-chemical ($48·19) and activated sludge ($39·38) processes, sprinkling filters ($36·45), chemical precipitation ($30·63), pumping to Fifty-first-street sewer ($24·05) and to Booth-street sewer ($22·15). The electro-chemical process was dismissed because of cost and the uncertainty of results with stronger sewage.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

APPLICATIONS FOR LOANS.

Barrow T.C.—£10,300 for electrical extensions.

Dewsbury T.C.—£25,000 in connection with the gas-works.

LOAN SANCTIONED.

Berks C.C.—£3,090 for the improvement of the Bath road.

FORTHCOMING INQUIRIES.

AUGUST.	£
22.—**Wantage.** For works of surface-water drainage (Mr. A. G. Drury)	600
22.—**Wantage.** For works of sewage disposal (Mr. A. G. Drury)	2,550
23.—**Aldershot.** For the provision of public conveniences (Mr. A. G. Drury) ...	1,000
24.—**New Sarum.** For the provision of water-pumping plant (Mr. W. O. E. Meade-King)	4,200
SEPTEMBER.	
Town Planning.	£
13.—**Neath.** (Mr. George L. Pepler)	—

Rhymney Valley Sewerage Works.—At a meeting of the Rhymney Valley Sewerage Board on Wednesday the engineers, Messrs. Chatterton & Alford, reported that on July 27th the contractors, on their own initiative, ceased work on contract No. 1. The board decided to give notice to the resident engineer and inspector to terminate their contract.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars have reached us during the present week. Other reports will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Arbroath T.C.—The Local Government Board have approved of the proposed arrangement for the acquisition by the town council of the two-sevenths share of the Arbroath District Committee of the county council in the isolation hospital in which both bodies have had a joint interest since its erection. The price to be paid by the town council is £3 250. The Local Government Board approve of the proposal of the burgh local authority that the diphtheria pavilion at the hospital used at present for tuberculosis should be permanently reserved for the treatment of tuberculosis.

Falkirk T.C.—The town council have accepted with thanks a gift of £3,000 from Mr. Robert Dollar, of San Francisco, California, for the purpose of building public baths in Falkirk, of which he is a native.

Ipswich T.C.—The town council have accepted the offer of the Carnegie Trustees to give £15,000 for the provision of a central public library.

Middlesbrough T.C.—The borough surveyor, Mr. S. E. Burgess, has been asked to prepare plans for the extension of the sanatorium.

Stockport T.C.—It is proposed to purchase property at a cost of £2,700 for the purpose of an electricity generating station.

MOTOR TRANSPORT.

Barrow T.C.—Tenders are to be obtained for an electric lorry.

Ilford U.D.C.—The question of providing hauling lorries and road-watering machines is being considered.

REFUSE COLLECTION AND DISPOSAL.

Aldershot U.D.C.—In his report, the surveyor, Mr. F. C. Uren, stated that he would be glad to see an improvement in the type of dustbin, the receptacles at present employed in the town being in a very dilapidated condition.

Epping U.D.C.—The council are considering the question of dealing with the collection of house refuse by direct labour.

Petworth R.D.C.—In a report on an improved system for the collection of refuse, the inspector of nuisances *pro tem.*, Mr. G. T. Suter, advised the provision of proper domestic dust receptacles, but the council decided to defer the matter for the present.

Sandown U.D.C.—The General Purposes Committee reported that on the recommendation of the medical officer they had decided that householders should be urged to burn all the refuse possible. Considerable economy could be effected by this means, both from the point of view of the town and householders, and the committee were advised that the fly pest and its concomitant dangers would be mitigated, if not altogether avoided, were the suggestion carried out generally.

ROADS AND MATERIALS.

Argyllshire C.C.—The Lorn District Committee have approved of the line of route of the proposed road between Kinlochleven and Ballachulish. In connection with the scheme grants amounting to £4,000 will be received from the Road Board and the British Aluminium Company, in addition to the loan of £4,000 from the Road Board for seven years, free of interest, and a further loan of £11,500 upon the best terms which can be arranged.

Ayrshire C.C.—The estimates for the maintenance of highways for the current year were submitted at a meeting of the County Road Board on Tuesday. The estimated expenditure in the Ayr district was £12,936; in the Carrick district, £7,442; in the Kilmarnock district, £12,914; and in the northern district, £14,613, making a total of £47,907, or a decrease of £1,153 as compared with the previous year. There are 1,298 miles of highway in the county.

Baltinglass No. 1 R.D.C.—In consequence of no tenders, or unsatisfactory tenders, being received for work on a number of roads, the council referred the matter to the county council.

Baltinglass No. 2 R.D.C.—In consequence of the serious damage to certain district roads caused by the July storm, the council have adopted the recommendation of the county surveyor, Mr. S. G. Gallagher, to apply for an extension of the statutory limit of road expenditure from £1,633 to £2,400, in order to execute the repairs.

Bognor U.D.C.—The surveyor, Mr. O. A. Bridges, has received instructions to prepare a plan showing a widening of Chichester-road to an average of 22 ft. 6 in. in the vicinity of Longford-road.

Derry C.C.—The county surveyor, Mr. Charles L. Boddie, reported that damage to the roads and bridges, amounting to about £8,000, was caused by a cloudburst on July 24th. The districts affected included Derry No. 1 district, Coleraine, and Limavady. The county council are appealing to the Local Government Board as a matter of urgency to sanction a loan to meet the works of repair.

Kensington B.C.—Approval has been given by the Kensington Borough Council to a scheme of the acting borough engineer for laying clinker Mexphalte carpeting on clinker block paving which is in an unsatisfactory condition in certain streets. The area affected is 8,034 sq. yds., and the cost is estimated at 3s. 8d. per square yard. Highways Construction, Limited, are to lend the council a suitable crushing pan and provide expert advice and supervision at the council's works and on the streets. The works are to be carried out and the labour and materials supplied by the council. The Works Committee says it is not prepared at this stage to advise that clinker Mexphalte carpeting should be laid in streets used by heavy motor or other heavy vehicular traffic, though in Hornsey, where the material has been down for periods up to two years, certain roads treated with it are used to a certain extent by motor-'buses and other heavy vehicles.

Monmouthshire C.C.—The Main Roads Committee have been authorised to obtain a loan from the Road Board for five years free of interest, and to purchase engines, trailers, and stone crushers, at a cost not exceeding £2,000.

Steyning East R.D.C.—It has been decided to approve the proposal of the East Sussex County Council to insert in contracts for steam haulage similar conditions to those inserted in the contracts entered into by the county council. These conditions provide that the surveyor should have the right at any time to give such directions as he should think fit, both as to the number of trucks to be drawn and the weight of the material to be carried. In the absence of any special directions, the number of trucks to be drawn should not in any case exceed two, and the weight to be carried, exclusive of the weight of the engine and trucks, should not exceed 15 tons.

SEWERAGE AND SEWAGE DISPOSAL.

Chatham T.C.—The town council in committee have approved certain alterations in the plans of the proposed scheme for the internal sewerage of the borough, and have resolved to apply to the Local Government Board for a loan of £65,840 for carrying out the work, and £3,994, the fees payable to the engineer. It is not intended to proceed with the scheme until after the war.

Hertford R.D.C.—A site has been obtained at Tewin for the purpose of sewage disposal works.

Hendon U.D.C.—The council have spent recently about £20,000 in constructing additional precipitating tanks and percolating filters. The Local Government Board stopped the progress of the work owing to the present crisis. Mr. H. T. Wakelam, the county engineer of Middlesex, in his annual report, says he regards it as particularly unfortunate that this course has had to be taken, as the extensive works already carried out will be of no value until the whole undertaking is completed.

Kidderminster T.C.—A report has been prepared showing a profit of £624 from the sewage farm.

WATER, GAS, AND ELECTRICITY.

Aberdeen T.C.—It was reported that the total expenditure in connection with the promotion of the Water Bill was £5,116, and it was remarked that this

was the smallest sum the corporation had ever had to pay for the promotion of a Bill of such magnitude, involving the expenditure of about £500,000.

Arbroath T.C.—The working of the gas undertaking has proved so satisfactory that the price of gas has been reduced by 2½d. per 1,000 ft.

Blackburn T.C.—It is proposed to rebuild the Greenbank gasworks and instal vertical retorts, at an estimated cost of £85,000.

Chelmsford T.C.—It has been agreed to enter into a further four years' contract with the electric supply company for public lighting, conditionally upon the company withdrawing their opposition to the town council's application to extend for one year the option to purchase the undertaking.

Dawlish U.D.C.—An official visit was paid by members of the council recently to Thorns, the watershed of 300 acres purchased from Sir R. Newman, at a cost of £5,000. It was stated that the watershed would give a supply for a town two or three times the size of Dawlish, if there was storage for it. The surveyor, Mr. S. F. C. Churchward, said that unless the present waste was stopped in a few years it would entail an 8d. rate to meet the expense of bringing more water into the town.

Derby T.C.—An extension of the electric mains, at an estimated cost of £5,000, has been decided upon.

Dundee T.C.—The Electricity Committee on Monday resolved to make application to the Scottish Office for authority to increase the borrowing powers by £27,000 to meet important developments in the department.

Greenock T.C.—The accounts of the water undertaking for the past year showed a credit balance of £171, against an estimated debit balance of £1,675. The nett surplus on the electricity undertaking was £6,998.

Ilford U.D.C.—With a view to utilising the steam at the refuse destructor specifications are being prepared for a high-tension alternating plant at the electricity works. The cost is estimated at £7,000.

Merthyr T.C.—It has been agreed to support the scheme of the Rhymney and Aber water authorities for the construction of a proposed new main.

Rothesay T.C.—It has been agreed to raise the price of gas by 10d. per 1,000 cub. ft., making it 4s. 9½d. per 1,000 cub. ft., with the usual 10 per cent discount on accounts paid within one month of rendering. Slot meters are to be set to 16 cub. ft. for 1d., with discount of 10 per cent.

Stansted (Essex) R.D.C.—The surveyor, Mr. C. Hicks, has been instructed to report on the water supply at Manadin.

MISCELLANEOUS.

Stoke-on-Trent T.C.—The borough surveyor, Mr. A. Burton, reported that he had prepared a rough list of works which might be put in hand should the council so decide in case of distress works being necessary at the close of the war. The Highways Committee recommend the council to take the matter into their urgent consideration.

Teddington U.D.C.—The council on Monday decided not to agree to their workmen's application for an increase of wages, but to increase the weekly war bonus as follows: Carters, 3s. 8d. to 5s.; roller driver, 1s. 11d. to 4s.; scavengers, 2s. 5d. to 3s. 6d.; dustmen, 2s. 3d. to 4s.; road repairers, 2s. 10d. to 4s.; carpenter, &c., 2s. 11d. to 6s.

Conway-Colwyn Water Bill.—In the House of Commons on Monday, the Conway and Colwyn Bay Joint Water Supply Board Bill was read a third time and passed.

Sanitary Slackers in Dudley.—At Dudley Police Court on Wednesday three men were summoned by Thomas Lee, contractor, employed by the Sanitary Committee of the corporation, for neglect of work. Mr. W. H. Thompson, for the prosecution, stated that the men absented themselves on five days in the holiday week, but as they had expressed contrition he applied for the cases to be adjourned for two months. Mr. T. W. Smith (presiding magistrate) said the employer had taken a very lenient view of the case, especially in view of the danger to public health likely to result from the neglect of the work these men had to do. If the men did not attend to their duties in the future the magistrates would mark their displeasure in a very drastic way. The application was acceded to.

PERSONAL.

Mr. Philip Kent, surveyor to the Baldock (Herts) Urban District Council, has joined the Army.

Mr. W. H. Adams, chief assistant in the Romford surveyor's department, has joined the Forces.

Second-Lieut. Robert Rosbotham, surveyor to the West Lancashire Rural District Council, is in hospital at Rouen, suffering from gunshot wounds in the cheek.

Private H. Whitehead, a member of the junior staff of the City of London surveyor's department, has been awarded the Military Medal for bravery in the recent Somme fighting.

Mr. H. T. Ridge, surveyor to the Romford Urban District Council, who has been indisposed for some time past, in acknowledging a letter of sympathy from the council, states that he is not making much progress.

Mr. Raymond Unwin, chief town planning inspector to the Local Government Board, will, it is expected, shortly proceed to Dublin to advise the corporation in connection with the rebuilding of parts of that city.

Mr. M. Hainsworth, surveyor to the Teddington Urban District Council, has been authorised to act as consulting surveyor and sanitary inspector to the Hampton Wick Urban District Council while the surveyor to the Hampton Wick authority is on military service.

Second-Lieut. C. E. Maynard, R.A.S.I., 14th Northumberland Fusiliers (Pioneer Battalion), has recently been promoted full lieutenant. He has also been awarded the Military Cross for distinguished service in defending a small wood in the initial advance on the Somme on July 1st. In civil life Lieut. Maynard is assistant to Mr. W. J. Grant, surveyor to the Romford Rural District Council, who has been directed to forward the council's congratulations. Other assistants serving from the surveyor's department are Corporal F. Alderson, R.E., now in Salonika, and Gunner J. Page in Egypt.

Mr. Daft, who has been acting as deputy county surveyor of Oxfordshire, has joined the Forces, and the chairman of the county council, Mr. W. H. Ashhurst, stated at the quarterly meeting recently that the council were very fortunate in getting the services of a county surveyor with the experience of Mr. E. Purnell Hooley. He thought they were greatly indebted to that gentleman for taking the position, he having retired for some two or three years. Mr. Hooley was for a quarter of a century county surveyor of Nottinghamshire, and he is known among road engineers the world over as the inventor of "Tarmac."

OBITUARY.

Mr. J. Stanley Sawdon, Assoc.M.Inst.C.E., surveyor to the St. Annes-on-Sea Urban District Council, died recently, we regret to state, at the early age of thirty-four. He had only held the post since August, 1914. His municipal training commenced at Uxbridge under the late Mr. J. Freebairn Stow, to whom he was articled, and after being assistant surveyor there he was appointed chief assistant surveyor to the Staines Urban District Council. Subsequently he proceeded to Kettering as chief engineering assistant, and thence to Cheltenham, obtaining in 1908 the post of deputy borough engineer at Margate. Mr. Sawdon, it may be recalled, contributed a paper—dealing with the municipal works of St. Annes—to the recent annual meeting of the Institution of Municipal and County Engineers at Blackpool, and his district was among those visited by the members of that body during their stay at the famous Lancashire holiday resort.

Surveyors: Their Security of Tenure and Defence.*

By J. H. DREW, M.Inst.C.E.I., Borough Surveyor of Grantham.

(Conclusion.)

Probably one of the greatest levers in the plea for security of tenure is to be found in the reports made from time to time by the inspectors of the Local Government Board upon the sanitary circumstances and administration of many districts.

The author appends a few extracts from such a report following the inspection of an urban district having a population of over 7,000 and a rateable value of nearly £46,000.

"It is manifest from this report that the sanitary circumstances and administration of this district are not subjects upon which the urban district council are to be congratulated."

"Explanation is, it appears to me, to be found, at any rate in part—in the fact that small sanitary authorities generally, as also not infrequently larger similar authorities, do not possess in the persons of their members any having but scanty knowledge of sanitary law, sanitary requirements, or proper methods of sanitary administration."

"For education and guidance in these matters they must be dependent upon their officers, and the latter, if not trained and competent to advise and guide, or if wanting in influence to lead the authorities, fall short in one of their proper functions.

"Small districts cannot, of course, afford to secure the whole-time services of men of this class."

"It has to be borne in mind as regards small districts that personal relations between district councillors and friends and acquaintances are apt to interfere unduly with proper and impartial administration of those districts; now and again, indeed, there are found on such councils men who own property not always the best in the districts they represent—sometimes, perchance, almost the worst—and others who, being interested in building operations, are not enamoured of by-laws."

"When such conditions obtain the work of officials is always delicate, and sometimes their positions are rendered very difficult."

Here we have the concluding paragraphs of an official document, one only of many similar reports which could be found stored away in the pigeon-holes at Whitehall. Could any stronger evidence be procured in justification of the appointment of properly qualified and trained officials, and to give those officials, once their appointment is ratified by the Local Government Board, that protection and assistance which should be theirs, as Mr. Nisbet Blair has said, "Not as a favour, but as a right," to enable them to fulfil the duties cast upon them by Parliament impartially and conscientiously, and without fear or favour?

TYPICAL CASES OF PERSECUTION, ETC.

The author could give numerous typical instances which have occurred in quite recent times, where officials, and particularly surveyors, have been slandered, libelled, assaulted, maligned, harassed, intimidated and persecuted by vindictive councillors or those aggrieved, resulting in dismissal from office in some cases, and the loss of considerable sums in law costs in others.

Who knows whether it will be his turn next? Every member of the institution should be prepared and in a position to defend himself, and his honour, should he be assailed. The knowledge among councillors and the public that surveyors were so prepared would, in the author's opinion, be a great deterrent to those who think they can attack officials without hurt to themselves, under the guise of "privilege" and "fair comment."

The author submits that the best way to bring about Government action would be to follow the line of the National Union of Teachers, and get a large proportion of surveyors to combine for a common defence fund, which could most easily be done by taking out the litigation policy in Official Security, Limited. By vigorous litigation in the courts of carefully selected cases, public attention would be powerfully drawn to the worst evils of the present system, and such cases would materially strengthen the pressure on the Local Government Board. Medical men have such a scheme, and so have motorists in their automobile associations, and there is every reason why surveyors should be similarly protected. The National Union of Teachers have found such action gives a great measure of security of tenure. If this course is followed, the author is confident that members will have marched a long way towards the attainment of security of tenure.

The author contends that the more highly trained a surveyor may be, the more his difficulties in the smaller districts are often correspondingly increased. Many of the residents and councillors love the old régime, and if a surveyor endeavours to educate and guide his councillors and to influence them in the manner suggested by the Local Government Board, his conscientious endeavours and high motives solely in the interests of the authority which employs him are often wrongly interpreted as "officiousness," "red tape," "by-law craze," "too expensive ideas," or even it may be alleged by speculative or jerry builders that his request for adherence to the by-laws is done to stop private building enterprise in favour of municipal housing.

It is well known that some councillors are of opinion that the officials are appointed, not to advise or guide the council, but to carry out what the council tell them to do. This type of councillor in the smaller districts is a difficult and often dangerous person to tackle, and strongly resents the introduction of new methods or ideas into the township, which are quite the opposite to what he may have himself advocated for a long term of years as a member of the local board and later as a district councillor. What was satisfactory for such a councillor thirty years ago is still good enough for him to-day, although it is convenient for him to forget that new legislation, not made by the official of course, will not permit the latter to conscientiously discharge his duties, and at the same time ignore the principles which his education and training have taught him are those which should be followed in the interests of, and for the benefit of the community which he serves.

The author hopes that a determined effort will be made by all ranks to bring about the maturity of the desired end, and in the meantime that each individual will so protect himself that the conscientious discharge of his duties will not bring him penniless and ruined in his career to the feet of his aggressors.

> "'Tis not in mortals to command success;
> We will do more, deserve it."

[As will be remembered, Mr. Drew's paper was among those which were "crowded out" at the annual meeting of the institution at Blackpool, but a number of written communications, which we reproduce herewith, have since been received by the secretary.]

Mr. W. Matthews Jones (Chester) said that "security of tenure" could only be obtained by the Local Government Board having a full say in the appointment of officials; if this were not allowed then the whole thing would fall to the ground, because if the official expected the Local Government Board to protect him when the time came then it was also necessary that they should have some say in the appointment of such men. Further, how far was "security of tenure" to extend? Was it to be head officials only, or heads, deputies, first, second and third assistants, draughtsmen, wages clerk, &c., and if so, how were these to be defined? Because he could quite imagine that the Local Government Board would not care to be bothered with regard to the appointments of first, second and third assistants, &c. One way out of the difficulty was for the surveyor himself, instead of his council, to appoint such men. Another way was to have what one might term a "permanent" and a "temporary" staff, so that anyone being appointed could be told that for the first four years or so they would be considered as on

*From a paper submitted at the annual meeting of the Institution of Municipal and County Engineers.

the "temporary" staff, and at the end of this period they could, if they so desired apply to be put on the "permanent" staff, and the committee or council could then have a say in the matter and, if necessary, refer to the Local Government Board. It was also manifestly unfair that only medical officers of health and sanitary inspectors should have this protection, because the surveyor in many cases had to carry out the various sections of the Public Health, Private Street Works, and other local Acts, and this very often brought him into antagonistic relations with the members of his council, and the ratepayers generally, although he was only doing his duty in carrying out such Acts. He hoped that there would be a more combined effort to secure the objects for which all surveyors should strive—viz., "security of tenure" and "superannuation."

Mr. J. H. Walters (Congleton) said the members of the institution were greatly indebted to Mr. Drew for the valuable and succinct paper on "Surveyors: Their Security of Tenure and Defence," and it was to be regretted that it was crowded out at the annual meeting. A discussion on the subject would have, no doubt, brought out the views of many members on this burning question, which had been on their minds for many years; perhaps cleared up differences of opinion, points of difficulty, and paved the way to a practical scheme being evolved; more especially since the Local Government Board had recently declared themselves ready to issue an order at the termination of the war giving whole-time medical officers of health and inspectors of nuisances security of tenure. The Local Government Board had evidently come to the conclusion that if a medical officer of health or an inspector of nuisances was to do his duty without fear or favour he must have some protection from the vested interest which was sometimes brought to bear against him. Mr. Drew had very clearly pointed out that municipal surveyors were quite as much liable to attack as the medical officer of health or the inspector of nuisances. His arguments were fully substantiated by the recent case at Kingston. As municipal surveyors, all were well aware that few duties were more liable to bring them into collision with owners and occupiers than the lopping of trees and the cutting of hedges, dangerous buildings, means of escape in case of fire in factories, and a thousand and one other causes. All the discretion and tact possible would not sweeten the malevolently-inclined owner or occupier. Security of tenure was quite as much a necessity to the surveyor as to the inspector of nuisances. How often did one read in the principal Public Health Act: "Where on the report of the surveyor of the local authority"? He was asked to decide whether a house was properly and effectively drained, whether there was sufficient and proper sanitary accommodation in factories, whether a house had or had not a proper water supply, &c. &c., and all this after, perhaps, a report from the sanitary department; and was the surveyor not liable to be "slanged" at the sanitary department's expense for making a report that would compel the owner or occupier to dip their hands into their pockets? If the Local Government Board had these points put before them again by the council immediately the war was over, it would do much towards the desired security of office, and some consolation to the author of a most interesting paper.

Mr. Oswald A. Bridges (Bognor) wished to congratulate the author upon the very able paper he had provided for discussion at their annual meeting on a subject which widely affected the interests of every surveyor in the kingdom. No one realised their position more as regarded "insecurity of tenure" than he did, when he started his life as a "chief" surveyor twenty-three years before. He was compelled to save every penny he could to fortify himself against risk of this kind. Legislation should have been asked for years ago, to secure the tenure of office and superannuation of every surveyor. Surely if medical officers of health and sanitary inspectors enjoyed security of tenure of office, and Poor Law officers had superannuation, surveyors, who carried out quite as important duties, or even more important duties, should have the same consideration shown to them. It appeared to him that surveyors would not obtain these advantages unless they woke up and studied their own interests a little more. Now Mr. Drew had started the ball rolling again on this question, the question must be pushed forward on every occasion until success crowned their efforts. He was sure the institution would help them in every way and bring the matter forward when the war was over. The author had their best thanks for the pains he had taken in bringing the subject before them in such a masterly way.

Mr. A. E. Prescott (Eastbourne) said that many of the members of the institution attending the annual meeting at Blackpool were extremely disappointed that this admirable paper written by Mr. Drew was, so to speak, laid on the shelf, while considerable time was taken up by discussing the same old threadbare topics of less importance. Mr. Drew's paper was undoubtedly of considerable value, and was deserving of better treatment. He summed up the whole case in one sentence when he stated that the non-success of the scheme so far was entirely due to the inertia and indifference of the surveyors themselves. This was indeed true; otherwise a paper of such importance would have secured a hearing and not been crushed out by subjects which have been discussed *ad nauseam*. It was, however, apparent that one could not, in such strenuous times, expect members of Parliament or the Government to give consideration to the subject of "security of tenure." All efforts must be directed to keeping the old flag flying; but, recognising that the subject was of extreme importance, he would suggest for the president's consideration the convening of a special meeting during his year of office, to give the members a full opportunity of taking part in the discussion of Mr. Drew's paper. As the result of such deliberations a practical scheme might be evolved, and representations made by a strong deputation to the proper quarter.

Mr. G. B. Hartfree (Alton) said that he would like to quote a case that came under his notice several years back. Making a brief holiday, he called upon a borough surveyor, and met a man whose face bore the expression of one who had received his death-sentence. He soon poured out his woes; he had prepared a scheme of sewerage and sewage disposal, entailing the consequent increase to his work. Without in any way consulting his views, his council engaged a clerk of works to supervise the construction and who apparently had approved anything and everything. The surveyor's time was fully occupied elsewhere, and his councillors were evidently adepts at "badgering the surveyor," as the whole time his permanent works were in hand he was harassed in connection with routine work, making his supervision of constructional works impossible. The root of his troubles appeared to be entirely due to the fact that the council had not voted sufficient funds to execute all the works they required. The following are examples of what was witnessed: "Oh, Mr. A., you ought to have the watercart out in X-street at once." Five minutes later; "Mr. A., the house refuse has not been collected at my cottages in Y-street." Two minutes after: "Mr. A., I was down Z-street a short time ago, and the men are at a standstill awaiting the materials you promised to send." The irony of the affair was that the corporation possessed but one horse, and the surveyor was not permitted to hire any other. He showed some of the permanent works and pointed out lines that were neither horizontal, vertical, straight nor curved, and said that when he noticed these and called upon the contractor to alter them, he was informed that the clerk of works had passed them, and they would not be altered. His council were divided; some blaming the contractor, some of the clerk of works; several blamed the surveyor, none blamed themselves. Mr. Hartfree sympathised with his suffering colleague, but about three months after leaving his town was informed that he had become insane. It seemed that the subject of protection of surveyors did not receive attention at the annual meetings of the institution, and this neglect was entirely due to the indifference of the members attending. It was obvious that those present at such meetings had a good class of councillor to deal with, but this made it more important that thought should be given to brother officers less fortunate.

The President (Mr. J. S. Brodie) said the author deserved the sincere thanks of every member of the institution for the excellent paper which he had prepared on this subject. There could be no reasonable difference of opinion as to the advisability of some form of protection for public officials engaged in carrying out statutory duties. On the other hand, it was distinctly unreasonable, and, indeed, would

be detrimental to the public service, that members should possess professions amounting to a freehold in the offices which they filled. The evil of such a security was glaringly illustrated in the case of ecclesiastical appointments, and surely no one wished to set up a system of security which was seen to lead to such undesirable results. The author said very truly that "Union is strength," and a solution of this problem would be found by heartily supporting N.A.L.G.O. proposals for superannuation, and security of tenure would form a natural and fitting corollary to a satisfactory and compulsory superannuation scheme, and their efforts should be concentrated in that direction.

Mr. Drew said he was indebted to the president and those members who had so kindly taken the trouble to submit written communications upon his paper, and greatly regretted that it was not possible for a full discussion to take place at the annual meeting. He predicted the result long before the Blackpool gathering, and when he saw the paper had been given twelfth place in the programme he quite realised that, to use a racing phrase, the paper "would be left at the post." He trusted that his effort to raise a discussion on the subject would not have been in vain, and that such interest would be aroused among members that that inertia which had been so evident in the past would be swept away. He commended to the notice of members the attitude of the president on this subject; evidently Mr. Brodie was not a whole-hearted supporter of "security of tenure," but, being a gentleman well advanced, both in years and in the profession, he evidently attached more importance to superannuation. Perhaps if the president assented to Mr. Prescott's suggestion for a discussion of the paper on some future occasion, they would have the benefit of his views and those of others who might be pessimistic as to the results which would follow the attainment of "security of tenure." The author adhered to the opinion expressed in the paper that "security of tenure" was of more importance than "superannuation," particularly in the smaller districts. In reply to Mr. Matthews Jones, the author quite agreed that the Local Government Board should have a voice in the appointment to surveyorships, and this was pointed out in making reference to the qualifications required under the Labourers (Ireland) Act, 1906. The author was afraid that it would further complicate matters in the attainment of the object if all grades of a surveyor's staff were included in a scheme for "security of tenure," although the point raised by Mr. Jones was one which should have very consideration. Mr. Walters further substantiated his plea, and, had the discussion taken place, it was the intention of the author to make reference to specific cases of dismissal, persecution, libels, &c., which had taken place, but it would not be wise to publish such instances, as to do so might be harmful to any colleagues who might be interested parties. The Kingston case was a typical instance, and congratulations were due to Mr. Clucas upon the result. The author could appreciate to the full the hours of anxiety and worry which followed in the train of such vindictiveness and persecution. Mr. Bridges evidently knew what it was to feel that "insecurity of office" to which anyone was at any moment liable, and, if nothing more, the author would feel repaid for his trouble in the preparation of the paper if, as Mr. Bridges said, "it had started the ball rolling." Mr. A. E. Prescott very aptly weighed up the position, and the author would be pleased to fall in with his suggestion should an opportunity be given for discussion of the paper at some future meeting. Mr. Hartfree penned a very able picture showing but one of the many little incidents which occurred daily in the smaller towns and districts, when councillors and city fathers often took pleasure in badgering the surveyor in the manner indicated by Mr. Hartfree. Many an overworked and under-staffed surveyor had been "cornered" and brought to earth in that cruel and Hunnish manner.

Admiralty's Housing Scheme at Greenock. — The housing scheme which the Admiralty proposed to carry out at Gourock has now proceeded with, and in the meantime it has been decided to erect forty-eight cottages at a cost of about £20,000. Local enterprise has, for a variety of reasons, failed to make good the serious shortage of accommodation.

DE-TINNING COMPANY'S SCHEME.

LOCAL AUTHORITIES' SUPPORT.

Keen interest has been evinced by members and officials of public bodies in all parts of the country in our article of last week with reference to the forthcoming meeting in London at which the British De-Tinning Company, of 75 New-street, Birmingham, will explain their scheme by which local authorities, working in co-operation with that firm, will be enabled to dispose of the old tins and waste metals from refuse with greater profit to themselves than is possible under present arrangements. A very large number of inquiries have reached the company, and we are able to announce the following additional acceptances for the gathering:—

Dover—Alderman J. W. Bussey; Durham—Alderman Jonathan Samuel, M.P.; Guildford—Alderman Patrick, J.P. (chairman, Sanitary Committee); Reigate—Councillors F. E. Lemon (chairman) and E. S. Edge; Scarborough—Councillor Frank White (chairman, Cleansing Sub-Committee); Wood Green—Councillors A. E. Salt (chairman, Health Committee) and H. Muskett (chairman, Highways Committee); Woolwich—Councillor S. H. Cuff (chairman, Works Committee); Portsmouth—Councillor J. E. Pink (chairman, Drainage Committee); New Malden, Surrey—Councillor Woollacott (chairman of committee); Chesterfield—Councillor Geo. Clark (chairman) and Mr. William Tomlinson (manager, sewage disposal works).

Horsham—Mr. J. B. Morgan; Worthing—Mr. F. Roberts, borough surveyor; Chatteris—Mr. S. Hipwell, surveyor; Northampton—Mr. A. Fidler, borough engineer; Hereford—Mr. John Parker, borough surveyor; Itchen—Mr. T. A. Collingwood; Shorehamby-Sea, Mr. A. W. Nye, surveyor; Twickenham—Mr. F. W. Pearce, surveyor; Purley—Mr. Robert Chart, surveyor; Carshalton—Mr. Wm. Gale, surveyor; Birmingham—Mr. Jas. Jackson (superintendent cleansing department); Barnes—Mr. G. Bruce Tomes, M.INST.C.E., surveyor.

Towns which, if not represented at the meeting, are desirous of being furnished with a full explanation of the company's project with a view to co-operating, include Cheltenham, Burton-upon-Trent, Crompton (Oldham), Budleigh Salterton, Dawlish, Clayton (Bradford), Peterhead, Derby, Rhondda, Gloucester, Spenborough, Irvine, St. Helens, and Leatherhead.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

SURVEYOR OF HIGHWAYS.—August 25th.—East Kerrier Rural District Council. £80—£100.—Mr. M. H. Truscott, The Square, Penryn, Cornwall.

HIGHWAY SURVEYOR.—August 26th.—Claypole Rural District Council. £150.—Mr. A. J. Franks, clerk, 24 Lombard-street, Newark.

SURVEYOR'S ASSISTANT.—August 26th.—Hemel Hempsted Town Council. £80 to £100, according to experience.—Mr. W. R. Locke, borough surveyor, Town Hall, Hemel Hempsted.

GAS AND WATERWORKS MANAGER.—August 28th.—Devizes Town Council. £200 per annum.—The Town Clerk, Devizes.

ASSISTANT ENGINEERS.—August 28th.—Port of London Authority.—Chief Engineer, 109 Leadenhall-street, London, E.C.

SURVEYOR AND INSPECTOR.—August 28th.—Seaton Delaval Urban District Council. £150 per annum.—Mr. W. D. Soulsby, clerk, 3 Stanley-street, Blyth.

SURVEYOR AND INSPECTOR.—September 1st.—Beeston (Notts) Urban District Council. £225 per annum.—Mr. W. H. Redgate, clerk, Bentinck Buildings, Wheeler Gate, Nottingham.

TEMPORARY ASSISTANT.—Somerset County Council.—Mr. Gordon R. Folland, acting county surveyor, 13 Chamberlain-street, Wells, Somerset.

OFFICIAL REPORTS.

The Editor invites readers to forward regularly copies of annual and other reports, for notice in the columns of "The Surveyor."

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Buildings.

BANBURY.—August 19th. For converting a building into a fire station, for the corporation.—Mr. G. E. Wrigley, borough surveyor, Town Hall.

HOLLINGBOURN.—August 24th.—For rebuilding part of a bridge and erecting oak fences, for the rural district council.—Mr. H. J. Bracher, clerk, 33 Earl-street, Maidstone.

KILLARNEY. — August 25th. — For building 19 labourers' cottages, for the rural district council.—Mr. P. Carey, clerk, Board Room, Workhouse, Killarney.

Engineering: Iron and Steel.

SINGAPORE.—August 14th.—For the construction of a steel bridge, for the Public Works Department.—Chief Clerk, Colonial Engineer's Office, Singapore.

LONDON.—August 22nd.—For the supply of 1,000 forged steel driving wheel tyres, and 500 forged steel trailing wheel tyres, for electric tramcars, for the county council.—Chief Offices, London County Council Tramways, 62 Finsbury-pavement, E.C.

MANCHESTER.—August 22nd.—For the supply of hard-drawn copper trolley wire, for the Tramways Committee.—Mr. J. M. McElroy, general manager, 55 Piccadilly, Manchester.

KIRKCALDY.—August 22nd.—For the supply and erection of a wire fence, for the corporation.—Mr. W. L. Macnidoc, town clerk.

EDMONTON.—August 23rd.—For altering and erecting ironing and other laundry plant, for the Guardians. Mr. J. C. S. Mummery, architect, 13 Fitzroy-square, London, W.

ISLE OF THANET.—August 24th.—For the supply of two wrought-iron galvanised hot-water tanks, for the Guardians.—Mr. A. E. Fussell, Hill House, Minster, near Ramsgate.

MANCHESTER.—August 25th.—For the supply of high and low pressure steam and feed pipes, for the Electricity Committee.—Mr. F. E. Hughes, secretary, Town Hall, Manchester.

LONDON.—August 29th.—For the supply of one 5-ton steam tractor and three 6-ton trailers, for the Metropolitan Asylums Board.—Mr. T. Cooper, acting engineer-in-chief, Thames Embankment, London, E.C.

DUBLIN.—August 29th.—For the supply of single-phase and three-phase meters, for the Electricity Supply Committee.—City Electrical Engineer, Fleet-street, Dublin.

MANCHESTER.—August 30th.—For the erection of a refuse destructor furnace, for the Board of Guardians.—Mr. J. Macdonald, clerk, Union Offices, All Saints, Manchester.

ROCHDALE.—For the supply of static transformers, for the Electricity Committee.—Mr. C. C. Atchison, Electricity Works, Dane-street, Rochdale.

Roads.

BERKHAMSTED.—August 21st.—For the supply of slag, for the urban district council.—Mr. J. R. Hadfield, surveyor, 135 High-street.

SCUNTHORPE.—August 30th.—For the supply of any quantity up to 400 tons of broken granite of approved quality, for the urban district council.—Mr. Herbert Heap, engineer and surveyor, 110 High-street, Scunthorpe.

HASLEMERE.—August 31st.—For the supply of about 800 tons (more or less) of 2-in. and 1½-in. broken granite, for the urban district council.—Mr. Howard V. Snook, surveyor, Council Offices, Haslemere.

BEDFORD.—September 4th.—For the supply of 1,750 tons of broken granite, 4,740 tons of ironstone slag, and 1,600 tons of ironstone slag tar-macadam, for the corporation.—Mr. N. Greenshields, borough engineer and surveyor, Town Hall.

FOLKESTONE.—For the supply of flints and Kentish rag, for the town council.—The Borough Engineer.

Sanitary.

WIGAN.—August 21st.—For the supply of 250 galvanised sanitary pans, for the corporation.—Mr. W. H. Tyrer, town clerk.

TENDRING.—August 21st.—For the execution of scavenging and cleansing sewage tanks, for the rural district council.—Mr. A. J. H. Ward, clerk, 42 Church-street, Harwich.

WANDSWORTH.—August 21st.—For surface water drainage works at Wandsworth Cemetery, Magdalen-road, Wandsworth, for the borough council.—Mr. P. Dodd, borough engineer, 215 Balham High-road, London, S.W.

HARTISMERE.—August 31st.—For the construction of a sewer drain, for the rural district council.—Mr. H. Warnes, clerk, Council Offices, Victoria-road, Eye.

MOTTRAM-IN-LONGDENDALE.—September 9th.—For cleansing closets and ashpits, for the urban district council.—Mr. S. Hudson, inspector.

Stores.

ROCHESTER.—September 5th.—For the supply of road metal, brooms, horse hire, and tools, for the corporation.—Mr. W. Banks, city surveyor, Guildhall.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of* SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.

* Accepted. † Recommended for acceptance.

LEATHERHEAD. For the supply of 130 tons of 2½ in., 60 tons of 1½ in., 15 tons of ⅝ in. of slag macadam, and 8 tons of slag dust, for the urban district council.—Mr. S. R. Drake, surveyor:

Constable, Hart & Co., London.*—Slag macadam—2½ in., 17s.; 1½ in., 17s. 9d.; ⅝ in., 18s. 6d. Slag dust—14s.

H. L. Cooper, London.—Slag macadam—2½ in., 18s. 4d.; 1½ in., 18s. 9d.; ⅝ in., 19s. 4d. Slag dust—12s. 6d.

Tarmac, Limited, London.—Slag macadam—2½ in., 18s. 5d.; 1½ in., 18s. 11d.; ⅝ in., 19s. 5d. Slag dust—12s. 6d.

W. Prestwick & Sons, Dronfield.—Slag macadam—2½ in., 19s.; 1½ in., 19s. 6d.; ⅝ in., 19s. 6d. Slag dust—10s. 3d.

J. Wainwright & Co., Shepton Mallet. Slag macadam—2½ in., 19s. 6d.; 1½ in., 19s. 6d.; ⅝ in., 20s. 3d. Slag dust—13s. 6d

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

SEPTEMBER.

16.—Institution of Municipal and County Engineers: Southern District Meeting at Bristol.

21-22.—Municipal Tramways Association: Annual Meeting, Surveyors' Institution.

23.—Institution of Municipal and County Engineers: East Midland District Meeting at Melton Mowbray.

30.—Institution of Municipal and County Engineers: Eastern Sub-District Meeting (Suffolk, Norfolk, and Cambridge) at Stowmarket.

30.—Institution of Municipal and County Engineers: North-Eastern District Meeting at Wath-on-Dearne.

OCTOBER.

7.—Institution of Municipal and County Engineers: Meeting at Watford.

APPOINTMENTS OPEN.

SEATON DELAVAL URBAN DISTRICT COUNCIL.

APPOINTMENT OF SURVEYOR AND INSPECTOR OF NUISANCES.

The above-named Council invite applications for the joint appointment of Surveyor and Inspector of Nuisances from persons ineligible for Military Service. The appointment will be made for the duration of the war only. The person appointed will be required to fulfil all the prescribed duties of Inspector of Nuisances under the Public Health Acts and regulations made thereunder, and to act as Inspector under the Housing and Town Planning Act, 1909. Salary as Surveyor £50 per annum, as Inspector of Nuisances £100 per annum; total, £150 per annum. The Certificate of the Royal Sanitary Institute will be a recommendation. The person appointed will be required to reside within the district, and to devote the whole of his time to his duties. The appointment will be made subject to the sanction of the Local Government Board. Applications, setting out age, experience, and qualifications, and endorsed "Application for Surveyor and Inspector," should be sent to me at the undermentioned address so as to be received not later than Monday, the 28th August, 1916.

Canvassing will be a disqualification.

Dated this 14th day of August, 1916.

W. D. SOULSBY,
Solicitor,
Clerk to the Council.

3 Stanley-street,
Blyth. (3,071)

The Surveyor

And Municipal and County Engineer.

Vol. L. AUGUST 25, 1916. No. 1,284.

Minutes of Proceedings.

The Repair of Railway and Canal Bridges.

Among the various problems to which the advent of motor traffic has given rise, the question of the standard of repair for bridges carrying public highways over railways and canals holds a prominent place. In this matter the obligations of railway companies and canal companies respectively stand upon a somewhat different footing. As to railways, it is provided by sec. 46 of the Railway Clauses Consolidation Act, 1845, that bridges for carrying public roads over the line, with the immediate approaches and all other necessary works, shall be "executed" and at all times thereafter "maintained" at the expense of the railway company. With respect to canals there is no general Act, but the special Act authorising the construction of a canal usually contains provisions for the construction and maintenance by the canal company of bridges carrying roads over the canal, and, even in the absence of any such provisions, it has been held that a canal company which under the powers of its special Act severs a highway is bound, at common law, to make and maintain a bridge (*R.* v. *Kerrison*, 3 M. & S., 526). But what is the extent of the obligation?—or, in other words, the standard of repair? That is the question which the motor, and more especially the heavy motor, has brought to the fore. Is the standard to be taken to have been fixed once for all, at the time the bridge was built, in accordance with the requirements of the traffic reasonably to be expected to use the road at that (possibly remote) date? Or is it, on the other hand, a standard varying from time to time according to the requirements of the actual traffic of the day—in other words, an "up-to-date" standard?

It was in reference to canal bridges that the question first came before the Courts, in the case of *Attorney-General* v. *Sharpness New Docks, &c., Company* (77 L.J., 121). This company's special Act, which was passed in 1791, provided that they should not make their canal across any public highway until they should, at their own cost, have made such bridges over the canal of such dimensions and in such manner as the commissioners appointed under the Act should adjudge proper, and that they should keep such bridges in "sufficient repair." The canal was made in 1912, and bridges were constructed to carry several highways over it. Mr. Justice Phillimore thought that the standard of repair was to be measured by the traffic which was ordinary on the highways at the time the bridges were made. But he was overruled by the Court of Appeal, who held that the statutory obligation of the company was to support and repair the bridges sufficiently to bear the ordinary traffic which might reasonably be expected to pass along the highways according to a standard varying from time to time, sufficient to carry the traffic of the day. Shortly after this decision the question was raised with respect to a railway bridge in *Attorney-General* v. *Great Northern Railway Company* (noted in vol. xlv. of THE SURVEYOR, at p. 1059). In that case Mr. Justice Warrington decided in favour of the up-to-date standard for railway bridges, and that standard was consequently looked upon as established for both classes of bridge. Subsequently, however, the Sharpness New Docks case was carried to the House of Lords, who reversed the decision of the Court of Appeal and decided for the fixed as distinguished from the up-to-date standard so far as the bridges over this company's canal were concerned. Of course, strictly speaking, this decision could not be regarded as a precedent applicable to railway bridges, nor even to all canal bridges, since it was arrived at having regard to the wording of this particular company's special Act. Nevertheless, *post hoc* (and in this instance probably *propter hoc*), the Great Northern Railway Company appealed from Mr. Justice Warrington's decision, and the Court of Appeal, apparently considering that the case was governed by the decision of the House of Lords in the Sharpness New Docks case, allowed the appeal, thus creating a precedent for the fixed standard in the case of railway bridges. Their decision has recently been affirmed by the House of Lords, the majority of whom appear to have considered that their hands were tied by their own decision in the previous case. It is very interesting, however, to note that there was one dissentient voice in the House—viz., that of Lord Haldane, who was strongly in favour of the up-to-date standard. In giving his reasons for this attitude, his lordship said that he was a party to the decision in the Sharpness New Docks case, but that that was a decision on a statute differing substantially from the private Act they were then considering—*i.e.*, the Great Northern Railway Company's special Act, which incorporated the Act of 1845. He was quite unable to read the judgment of the House in that case as having done more than interpret a particular set of words. As was pointed out by the Lord Chancellor in the course of his judgment, the question is undoubtedly one of unusual importance. "On the one side," said his lordship, "it involved an undoubted limitation of the rights of user of public roads carried by a bridge over the lines of a railway company, and on the other it might throw on railway companies the obligation to reconstruct such bridges to meet the growing demands of heavy modern traffic. The circum-

stances in which the case had arisen must exist in many instances, and they were likely to increase."

Looking at the matter not so much as a question of the interpretation of particular words in a statute as one of general principles, it appears to us that the up-to-date standard decidedly ought to prevail. If companies are allowed, for purposes of their own, to interfere with a public highway, it is surely only bare justice that they should remain under a continuing obligation to do whatever may from time to time be necessary to ensure that the public shall be in no worse position with respect to the use of the highway than they would have been in but for such interference.

Higher Engineering Education.

The higher education of the engineering assistant or young practising engineer is a problem which has perhaps been considered on broader lines in America than in this country. Here there is practically no alternative to the evening class, and even this is only possible for those who are fortunate enough to be within the reach of one of the large centres of population. In America there is a "Society for the Promotion of Engineering Education," and at a recent meeting of this body Mr. A. H. Blanchard read a paper on "Graduate Courses for Practising Engineers." The idea of these courses is that the practising engineer should be able to avail himself of the advantages of training at a modern university, including residence, with a minimum interference with his professional work.

As an example of a plan which has worked out satisfactorily in supplying the demand for graduate courses for practising engineers, Mr. Blanchard gave some details of the graduate course in highway engineering at Columbia University. The objects in view in founding this course were to elevate the profession of highway engineering in America to the plane of the National Department of Roads and Bridges of France, and to provide an opportunity for men engaged in highway work to obtain advanced instruction and training under favourable conditions. For many reasons it is fortunate that the first course of this character was established at a university presided over by a president and trustees who look upon the work of the university from an exceptionally liberal standpoint. While maintaining the high character of all degrees conferred, these men believe in opening the courses of instruction to any mature man, provided he has sufficient qualifications to enable him to derive benefit from any given course. Likewise it is fortunate that the administrative authorities allowed the introduction of an innovation as far as the period of attendance is concerned. The arrangement of the graduate work so that the several courses can be taken by engineers, chemists, highway officials, and others desirous of securing advanced instruction in highway engineering under favourable conditions has been fulfilled by, first, giving all graduate courses in the period when it is practicable to secure leaves of absence, and, secondly, by giving each course in a period of from two to three weeks in duration. This latter arrangement enables men who are particularly interested in certain groups of subjects, or who are not able to be in attendance for the entire winter session, to take any desired courses. The university requires that each candidate for the Master's degree shall be in residence for one collegiate year or eight months. Candidates for the Master's degree in the graduate course in highway engineering may fulfil this requirement in one of three ways—first, by being in residence for one collegiate year, or from October to May inclusive; second, by being in residence for two winter periods from December to March inclusive; or, third, by the distribution of residence over several years by being in attendance for parts of three or more winter periods. We cannot help thinking that, if some of our "modern" British universities could see their way to make similarly elastic arrangements, the opportunities thus afforded would be eagerly seized by many young engineers who cannot afford the luxury of residence for any extended period.

Road Direction Signs.

The paper on "Road Direction Signs," submitted by Mr. C. H. Cooper, the borough engineer of Wimbledon, at the recent annual meeting of the Institution of Municipal and County Engineers, and reproduced elsewhere in this issue, though very short, is a useful contribution to an important branch of the road surveyor's work. The need for improved signs in these days is admittedly great. The change from animal to mechanical traction has so enlarged the area that vehicles can cover in the course of a day that drivers do not now possess the intimate acquaintance with the district they traverse that they formerly possessed. The speed at which they travel is considerably greater, and calls for better and more distinct signs than the old-fashioned signposts placed at cross roads or the junctions of roads. Although there are many good road maps published both for cyclists and motorists, it is not everyone that is capable of readily reading such maps; and in any case, good direction signs are much more useful and convenient to the majority of road users than the best map published.

Mr. Cooper is not only of opinion that more information is necessary, but that a signal should be given to drivers when they approach a crossing or junction of the road before they reach these points. He would supply this information either by means of a semaphore plan or an actual plan. If a semaphore plan is adopted, a plan of the crossing or junction is placed in each road leading to them at a distance of 100 ft. from the crossing or junction. The sign would give on the top line the name of the principal town to which the road leads and its distance, and on the bottom line the name and distance of the nearest village. The letters would be 3 in. deep, which would enable them to be read at a distance of 200 ft., or 300 ft. from the crossing. Complete plan signs would be more useful in many cases, but are not likely to be of such general service as the semaphore plan. Lantern signs in towns are now being very generally used at dangerous cross roads, and they have the great advantage of being visible by night as well as by day. When a single-sign lantern can be seen from all the roads approaching a crossing, Mr. Cooper suggests that a lantern should be placed with a face opposite each road, with a plan of the crossing on each face of the lamp as seen from the particular road that the lantern is opposite. The illustrations given in the paper show that if his system were generally adopted driving would be made much safer and pleasanter.

Official Salaries at Southend.

Officials who are "invited to make a sacrifice during the war" equal to a reduction of 20 per cent on their salaries may well pray to be saved from the tender mercies of the war-time economist, but happily the servants of the Southend Town Council will not be under the necessity of making any such supplication. The proposal, emanating from the Economy Committee, though made quite seriously, found only two supporters at the town council meeting, and thus died a natural death. It is true that the self-denying ordinance was intended to apply to salaries exceeding £200 per annum, and that in no case was the

total salary of an individual to be reduced below £200; but even so, the diminished purchasing power of the sovereign was a factor which must inevitably apply to the official as well as to the workman, and it appeared that the latter had been helped in part to meet his growing outlay by the grant of a war bonus. Moreover, there was an obvious lack of equality in the application of the suggested sacrifice, for if a reduction of 20 per cent might be considered fair in the case of an officer receiving, say, £1,000 a year, would not the same percentage be excessive in the instance of another receiving £250? Another consideration which ought not to be overlooked is that it would be something of an anomaly on the one hand to appeal to individuals to make every effort to save from their incomes with a view to investing money in some of the financial schemes for assisting to carry on the war, while at the same time it was proposed so to reduce the income as to render even small savings impossible. While a good deal may be said for suspending the process of automatic increases of salary during the war, an invitation to sacrificial reductions is merely suggestive of eccentricity on the part of those who make it.

Surveyors and Petrol.

A fortnight ago we ventured to suggest that in the allocation of petrol supplies which has been undertaken by a committee on behalf of the Government special consideration should be given to highway surveyors. Many of these officials are in charge of large districts that can only be administered efficiently with the aid of a car, and the work that they are doing is unquestionably of the highest national importance. But apparently nothing is to be done, for the present at all events, to increase the very inadequate allowances that have been made. Some days ago it was reported that the Board of Trade would consider the claims of assistant county surveyors for additional petrol allowances. Judging, however, by the reply to a question on the subject in the House of Commons last week, the result of this consideration is not encouraging. The question was asked by Mr. Robinson, who enquired of the President of the Board what special allowance of petrol is made to county surveyors, road surveyors, and chief constables of large counties whose duties entail the travelling of great distances; and if some extra allowance can be granted them out of the reserve held. The reply was that arrangements have been made under which chief constables will be allowed their full requirements of petrol up to 30 gallons a month, and in certain cases more than this amount, but that it has not been found practicable at present to make any special arrangements for county surveyors and road surveyors. One official informs us that he has written to the secretary of the Petrol Control Committee, but without result, or even reply. Perhaps an inquiry from one of the institutions representing municipal engineers would receive more prompt attention.

* * *

Cost of Road Upkeep.

It is interesting to read, and compare, some of the reports recently issued by various county and municipal surveyors with regard to the cost of road maintenance during these somewhat abnormal times. For instance, the nett cost in Northamptonshire appears to have been about £103 per mile, and for the roads directly maintained by the county council only about £44 per mile. In Warwickshire the cost has been £91 per mile, which, rather curiously, is the same figure as reported from Somerset and Newcastle-on-Tyne. In Pembrokeshire the cost is given at £58 per mile. In Skegness, Lincolnshire, the cost per mile was £63. In Herefordshire for rural main roads it was £63, and for urban main roads £176 per mile. It is unnecessary to pursue the figures further, but it is evident that very little, if anything, can be gained by an attempt at making any useful deductions from these figures. So much depends upon what is included in the figures thus given, the widths of the metalled portions of the roads, the condition in which they are maintained, and the nature of the traffic on them, and a host of disturbing factors make it impossible to use the figures to any advantage. For instance, it is very misleading to compare the annual cost of upkeep of the roads in a county or urban district where large capital sums have been expended in improving the surfaces of the roads with that in a county or district where very little, if anything, has been spent out of capital, just as it would be of little use comparing the figures of one district where the traffic is very heavy with those of one where it is very light. Road statistics to be of real value should be accompanied by the fullest information on these important points.

* * *

War and Waste.

Have the general public in this country yet realised that they could give the nation enormous help in winning the war if they would only make up their minds to stop all waste? This fact is brought home to us when we read that Liverpool will be obliged to construct a third pipe line from Lake Vyrnwy, owing to waste of water by their consumers, which the water engineer confesses he is unable to check or minimise owing to the depletion of his staff. The same culpable waste is stated, in a recent issue of a northern contemporary, to be going on at Blackpool, Fleetwood, Lytham, and St. Annes. A similar state of things prevails at Dawlish, in Devonshire, and indeed practically all over the country. This misuse of water is proverbial, and arises from neglected defective fittings, careless or wilful running of water to waste, the too-frequent employment of the garden hose, and in numerous other ways. When it is considered that every gallon of water wasted is costing money to supply, and that this money must come out of the consumers' pocket in the long run, it seems incredible that the public should be so short-sighted. It is certainly to be regretted that at the present time, when every penny saved means so much to the country, people should be so careless in their use of water. There have been a great many crusades against abuses of various kinds. Why should there not be one against this crying evil? It is for municipalities and their officers to consider what action is possible in the matter.

The Outlook for British Engineers in Canada.

Is it not possible that when the Great Crisis is over many of our returned engineers may look to Canada as a fertile field for the exercise of their professional skill? If so, our advice to them would be, emphatically, Don't! We have it on excellent authority that most of the towns and cities there have spent so much in the past, and the war has caused such a great set-back, that it will take a long time for them to revive the stage when the services of consulting engineers will be needed frequently. Moreover, practically all the plums in this line are given to American engineers. For many reasons there is a strong tendency to select them, while the next choice falls to Canadian-born engineers. It is generally held that American methods and ideas are best suited for Canada, and no doubt this belief is sedulously fostered by interested Americans. Anyhow, men from the Old Country are not encouraged, and it is well this should be put plainly.

Air-Diffuser Experiences with Activated Sludge Tanks.

[In the following article, which we quote from New York "Engineering News," differences of experience and opinion as to the use of porous-block and perforated-pipe diffusers for intimately mixing air and agitating sewage in activated sludge tanks are expressed by engineers in charge of test and working plants in various American cities, including Milwaukee, Baltimore, Brooklyn, Cleveland and Chicago.]

In the design and operation of activated sludge tanks questions that have received considerable attention and will probably be given much more are the possible clogging of the "filtros" or other porous blocks used for diffusing the air as it is forced into the bottom of the tank and up through the sewage, and the relative advantages of porous-block and perforated-pipe diffusers.

It is well known that in other mechanical operations where a large volume of air has to be forced through restricted passages the latter become clogged with dust and dirt, and must be regularly cleaned or the flow of air will be interrupted; at least, this will happen unless the air is first washed or otherwise cleaned of dust. To what extent is this same trouble likely to arise in porous diffusers in activated sludge tanks? In dealing with this general question in the discussion relating to experience at Milwaukee there appeared in *Engineering News* of February 10, 1916, in the course of some remarks by T. Chalkley Hatton, a statement that there was no trouble from clogging in the large tanks at the Milwaukee testing station. The air, however, is filtered through Excelsior placed in the air-feed pipe. The experience at Milwaukee also showed that there was no trouble during nine months' operation from filtros block clogging from the sewage itself.

Subsequent to the appearance of the article on the Milwaukee plant, a member of the editorial staff of *Engineering News* visited the large Imhoff tank at Baltimore, where, under the direction of Mr. Calvin W. Hendrick, chief engineer of Baltimore, and Mr. Leslie G. Frank, sanitary engineer, United States Public Health Service, one of the large new Imhoff tanks has been adapted to serve as an activated sludge tank. The experiences at Baltimore being somewhat at variance with those at Milwaukee, it seemed desirable to appeal to the engineers who have been most intimately connected with activated sludge work in the United States, asking them to summarise their experiences with air distribution in its relation to clogging of porous distributors. The responses to this request have brought out some interesting facts regarding perforated-pipe as well as porous-block distributors. Below are printed notes on the Baltimore plant kindly revised by Mr. Hendrick and supplemented by Mr. Frank, together with notes from various other localities and engineers.

BALTIMORE NOTES: REVISED BY MR. HENDRICK.

The air supply at Baltimore, before passing to the blower, is thoroughly washed to remove any dust it may contain. This washing is effected by passing the air through a 12-ft. length of a 12-in. cast-iron pipe set vertically. The air enters at the bottom and passes upward through gravel with an approximate diameter of ⅜ in. This gravel layer is supported 18 in. from the lower end of the pipe by a grid and extends to within 3 ft. of the top of the washer. A small stream of water is trickled through the gravel from the top and is taken off at the bottom by a float-actuated valve. The air at Baltimore is compressed by a rotary compressor having an eccentric rotating piston that requires a great deal of lubrication. Notwithstanding the thorough washing that the air receives before going through the blower, there has been found on the inside of the porous blocks* a deposit of oily sludge. This, it is supposed, comes from the lubrication process already mentioned. It is hoped that the oily deposit in the blocks can be avoided by substituting a rotary compressor of the gear type, or a high-pressure centrifugal blower (neither of which requires internal lubrication), for the kind of blower referred to above.

MR. FRANK ON EXPERIENCE AT BALTIMORE.

The diffuser grid installed in the activated sludge tank was first provided with carborundum discs, grit 120, the influent air being washed as is described above. Two facts soon become evident—that an oily sludge accumulated on the bottom surfaces of the discs, and that the air washer removed practically as much oil without the water stream as with it. The whole gravel layer soon became heavily coated with an oil film, and this oil film was as good, or probably better, than a water film for the removal of dust and oil particles. Neither oil film nor water film, however, removed the oil vapour that had been generated by the heat of compression, the air detention period in the washer being insufficient to effect its recondensation. This oil vapour, therefore, passed down into the manifold and condensed on the cold under-surfaces of the diffusers, gradually forming a sort of oily sludge compost with the particles of sludge that worked their way into the grid in times of shut-off. This oily sludge rendered the carborundum discs almost impervious to air and caused us to substitute filtros therefor. The same accumulation of oily sludge has been observed on the underside of the filtros plates, but owing to the greater porosity of this material the corresponding increase in resistance has not been so great as in the case of carborundum.

At present (April 29th) the air compressor capacity is being greatly increased by the installation of a Connersville blower, and it is hoped that at the same time the oil difficulties will be obviated, due to the fact that this type of blower requires no internal lubrication, as in the case of the blower heretofore used.

Since the above was put in type, Mr. Hendrick informs us, under date of July 11th, that a Connersville blower, with a capacity of 195 cub. ft. of fuel air per minute, has just been installed and the porous area of the grill has been doubled. Experiments on this installation have just began.

MILWAUKEE.

(Mr. T. Chalkley Hatton, Chief Engineer, Sewerage Commission, Milwaukee, Wis.)

As to the experience of Milwaukee, I might repeat the statement in *Engineering News* of February 10, 1916, in which I said that no trouble from the clogging of the filtros plates had been so far experienced at the Milwaukee testing station—that is, clogging due to the passage of the air through the plate. We have occasional clogging on the top of the plate, owing to the very heavy sludge temporarily alighting thereon and not being lifted through the body of the liquor.

We think this is due to the character of our sewage in that it carries a great deal of waste, entrails from the packing-house district, small pieces of leather from the tanneries and large quantities of hair. All this becomes massed together. The specific gravity, being thus largely increased, overcomes the tendency of the air to keep such masses in constant suspension. We think much finer screens than we now use will largely overcome this difficulty.

The Connersville blower which we are operating was designed with a view of preventing any lubricating oil used in the blower from getting into the discharge pipe, and the wood wool placed compactly in the filter seems so far to have intercepted the dust carried by the air.

While we have not removed any plates that have been in operation more than two months, there is no visible evidence in the operation of our plant that these plates are not giving just as good diffusion as when they were installed. Two months after our new and large fill-and-draw tank was first placed in operation we did remove some of the plates from it and carefully examined them for porosity. We found that they were in the same condition in this respect as when they were first introduced.

From the notes furnished me of the Baltimore experience, I should attribute the trouble to the lubricating oil from the compressor. This would not be entirely removed by the washing of the air. In fact, I do not place as much dependence upon the washing of the air as upon a good filter. Whether

* Carborundum discs of 120 grit were first used, but the differential pressure required to force the requisite amount of air through rose so rapidly (from less than 1 lb. to over 5 lb. per square inch) on account of clogging that filtros was substituted.

the wood wool is the best medium for this filter or not I am not prepared to say, but so far it has been successful with us. It is cheap, easily examined, easily removed and replaced.

We are now experimenting with a diffuser made of basswood, cut at right angles to the grain. We have made several experiments on woods of different characters, but fine basswood, so far, is the most reliable and gives the best diffusion with the least frictional loss. The air appears to be uniformly distributed in smaller bubbles than from the filtros plates, but whether the wooden disc will prove practical or not is a question yet to be determined.

We are trying 8 by 10 in. plates to determine, among other things, the total swelling of the wood, the uniformity of porosity during long-time service and the possibility of decomposition through aërobic action or through chemical action due to contact with the sewage. These, of course, are matters that can only be determined after considerable careful investigation.

BROOKLYN.

(Mr. George T. Hammond, Engineer of Design and in Charge of the Sewage Experimental Plant, Bureau of Sewers, Brooklyn.)

The activated sludge method of sewage treatment is so recent that it is not surprising if we have not yet learned the best technique of applying the principle in actual practice. The first experiments were made on a laboratory scale, or with apparatus designed for other methods of treatment, which could be modified for immediate use in temporary experimental plants. Resort to the actual trial of apparatus was the best, if not the only, way to gain essential working knowledge before serious problems in design could be undertaken; and, indeed these trials and experiments are as yet unfinished, and it is still too early to anticipate their results.

It is scarcely a year since the first plant on a working scale was put into service. While we may not forecast results, it is quite safe to hazard the opinion that several years must elapse before sufficient data of a satisfactory kind will be secured to permit an adequate solution of some of the problems presented. Considering the short time that has elapsed, it is rather surprising how much progress has been made.

Air diffusion into the sewage has been attended with considerable trouble, and affords one of the main problems involved in the application of the method.

The ideal air diffuser should give an easily controlled flow and volume of air, equally diffused to all portions of the tank, with bubbles of the "critical" size formed at the points of entrance. It should not tend to become clogged, or at least should not tend to unequal clogging. It should be readily cleaned in place without emptying the tank, or should be easily removable for replacement and for cleaning in case of clogging. It should show the minimum deterioration in service, and its cost should be reasonable.

The earliest aërator tanks of which the writer is informed employed grids of perforated pipe for this purpose. The experiments of Black and Phelps in Brooklyn were conducted with such grids, as was the continuous-flow aërating tank experimented with in 1914-15 at the same place. These grids have uniformly given good service, if designed on correct principles, and have shown but little tendency to become clogged.

Porous material used to diffuse air has shown a tendency to progressive clogging. This may possibly be reduced to a minimum by various forms of air filters, placed in the supply line, which promise to render its use practicable. It has been employed because it gives a very fine bubble, and the entering bubbles are distributed over a wide surface. While clear and new, it gives the air diffused a higher efficiency than does the perforated grid. But, in spite of every care, this freedom of discharge and high efficiency seem not always to be maintained. From whatever reason, some of the porous plates come to pass the air less freely than others. Examination of a number of tanks supplied by air in this manner convinced the writer that there was in every instance a material variation in the diffusion of the air in different portions of the same tank. This was evidenced by violent local ebullitions and evident local streaming out of air, while other portions of the tank surface remained quiescent, or nearly so. Photographs taken of the surfaces of a number of these tanks sustain this observation.

It was also observed, where this phenomenon was seen, that for one or another assigned reason the aëration period had been, in all the cases observed, materially lengthened. This result was quite in accordance with the writer's own experience with the use of porous diffusers. We found that our discs clogged very unevenly and that the entire supply of air was discharged through the unclogged disc without showing any decrease in quantity by meter.

It seems obvious that the primary cause of this trouble is the fineness of the pore, or passage, through which the air is diffused. Even if all dust and other foreign material are excluded by means of air filters, various kinds of bacterial and other minute forms of life, &c., enter freely and may cause obstructing growths. The sewage directly over such plates may enter the pores and cause obstruction in various ways, among which may be mentioned deposits of mineral matters from solution. In short, there are many ways by which porous material can become clogged, even if the greatest care is taken to prevent it.

In view of the foregoing, it seems desirable to find some other method of diffusion. Apparently, the porous material answers only one of the above-mentioned ideal requirements of a distributor—that of giving a very fine size of air bubble.

Experiments have shown that the finer the bubble the more the pressure needed to distribute the compressed air and the greater the danger of clogging. The finer the bubble the greater its efficiency, but the more expensive the air. The tank efficiency is highest when its reliable average performance gives the effluent required at the least expense for air.

The experiments conducted in Milwaukee in 1915, reported by Mr. Hatton, seem to indicate that the porous material was rather the best for diffusing air, although he states that "there appeared to be little difference in the character of effluent obtained by the same volume of air, whether it was applied through an open jet or a filtros plate."

It seems to the writer, in view of this and his own experience, that the use of porous material for diffusion has largely grown out of theoretical rather than practical considerations, and that further experimental work is very desirable. The useful age of service to be expected from a porous substance, it would seem, must be comparatively short, if we can depend upon our experience in other lines of work.

Our experience in Brooklyn has been in favour of the perforated grid, the pipes of which are placed not more than 12 in. apart and the perforation made of $\frac{1}{8}$ in. diameter, 6 in. c. to c. The grid in one tank aërator is still in service after over two and a half years, during which time it has had no cleaning. The depth of sewage aërated is 22 ft., and the distribution is very good.

Another tank, in which distribution was provided by porous discs, was not so satisfactory on account of clogging. The phenomenon of clogging in this tank was rather interesting. Some of the discs clogged, while others did not. As a result, a greater volume of air entered through the unclogged discs, causing intense local surface ebullition and streaming out of air, while at other places the surface was quiescent. As there is always an excess margin of working pressure, increased volume of flow can readily occur through the unclogged diffusers; thus the entire metered flow of air will still continue to enter the tank, but it may not reach half of the sewage, and much of it escapes by streaming. Why employ the porous material, to obtain the most efficient size of bubble, in order to save a small percentage of the air, if, as a result of the attempt, clogging or uneven distribution may occur and waste far more than could be saved by this means?

Unfortunately, there seems to be no satisfactory way to clean out the porous discs or plates without removing them. This problem has been ingeniously handled at Baltimore, where the diffuser discs are mounted on a framework of pipes that may be closed like an umbrella and the entire mechanism withdrawn by a derrick. This enables the operator to remove and replace a disc at will; but where the porous plates are built into the bottom of the tank, as in some plants, it is too early to feel certain that they can be kept in good order. But as the surfaces of the air inlets must be as nearly absolutely level with each other as possible, it may be difficult to obtain this with a movable distributor.

In the design of a sewage disposal plant refinements in operating parts are undesirable. The

mechanism that shall give the most reliable average service will usually be selected. For diffusing air in a tank filled with sewage the writer's observation leads him, in the light of present knowledge, to prefer the perforated-pipe grid, although it will not give the most efficient size of bubble.

The grid may be so designed that, if necessary, it can receive frequent flushings from the city water supply, which always has a greater head than the sewage in the tank; and it can be provided with drains, so that it may be flushed out with little trouble, without emptying the tank. Should the perforations become clogged with grease the tank may be emptied and steam or hot water discharged through the grid. Possibly further experiments may modify this opinion, which is offered by way of discussion on experimental work still in progress.

The question has several times suggested itself to the writer, "Would it not be possible to get along with less air by the use of mechanical agitation in the aëration tanks?" It would seem that much of the air applied at present is wasted, as it is only applied to produce agitation—a churning movement that seems to aid coalescence of the finer particles of colloidal matter, and facilitates the activation treatment. This has not been tried out so far as the writer is aware, but various means suggest themselves, such as paddles, screw propellers, movable air distributors designed to agitate the sewage and to diffuse air, jets of sewage discharged into the tank, if the sewage enters by pumping, &c. May not such a method greatly increase the effect of air, which could then enter by means of a rather coarse movable or stationary grid and be mechanically mixed with the sewage?

The importance of continuing our experimental work with the activated sludge method of sewage treatment cannot be overstated, and every possible advantage should be taken of constructive criticism, as well as experimental work.

SANITARY DISTRICT OF CHICAGO.

(Mr. Langdon Pearse, Division Engineer, Sanitary District, Chicago.)

My personal experience with small experimental units was satisfactory, but in the plant put into operation by us in January, comprising four units, with a capacity of 35,000 gallons per day on a twenty-four-hour period, we have had considerable difficulty with the clogging of the plates. This apparently has been caused by the sewage, which contains a good deal of paunch manure, straw, hair and other material that will mat and clog. A recent examination of one tank with a nominal inside dimension of plan of 6 ft. by 23 ft., with a single row of filtros plates down the centre, indicates that all the plates have been broken. The breaks are apparently due to downward pressure. The plates were supported on two sides only, in wooden boxes, lined with galvanised iron, and were set in jointite. The use of wood probably caused the trouble, a more rigid frame being desirable. The distribution in the tank was seriously interfered with, a considerable deposit of hair and coarse sludge being found underneath the plates, many of which were badly shattered. We are endeavouring to find the exact reason for this difficulty, although it appears to be due to clogging and the loading of the water on top. No provision was made for back-flushing by water. For various reasons the air pressure has been shut off from time to time. The air distribution has been remodelled, the boxes being stiffened, and an additional support placed so that all plates are supported on four sides. This has proved satisfactory.

The air at our testing station is furnished by a rotary blower of the Connersville type, working against a 6-lb. head, the depth of water being 10½ ft. over the plates. We have a muslin screen on the intake of the blower. So far as we can ascertain, there has been no difficulty on the underside of the plates from any oily deposits, there being no trace of oil in the air boxes underneath.

In order to cure certain difficulties in measuring the air with a Venturi meter, a steel storage tank 5 ft. diameter, 5 ft. high, has been installed. This reduces the pulsating effect and forms a trap for oil or moisture.

Before our experiments are concluded I hope to run comparative tests on two tanks with perforated pipes and two tanks with filtros plates. I believe that considerable thought is still required to determine the proper design for the air-distribution system in order to make it satisfactory at a minimum cost.

I believe that *Engineering News* will do well to impress upon its readers the importance of going slow in the adoption of activated sludge plants without thorough consideration of all the elements involved, as I think most of us still agree that it is not a simple process to operate, but one whose entire limitations are not yet developed.

The cost problem is still in the air, particularly the cost of handling the sludge. Another warning should also be issued on the short-time tests lasting only two or three weeks, which are liable to give misleading results, as it takes several months in general to determine the efficiency and limitations of sewage-treatment methods definitely. We have noticed in our work that good results are obtained for the first three or four weeks, and then difficulties begin to develop that were not anticipated.

HOUSTON, TEXAS.

(Mr. E. E. Sands, City Engineer.)*

Our experiments were all conducted with that variety of filtros manufactured by the General Filtration Company, and known as Grade 5-1. The catalogue published by the company states that where there is a nett head of 2 in. of water the capacity of a filtros plate 1½ in. thick and 12 in. square is 360 cub. ft. of air per hour, or 6 cub. ft. per minute, and that the porosity of this plate or the percentage of voids is 37·56. It is evident that the tests from which this table was prepared were made with dry air and under dry conditions. When a filtros plate becomes wet the porosity is reduced and its resistance to the flow of air increases. Careful experiments were carried on with the filtros plate in tank No. 3. This plate was submerged to a depth of 7 ft. 6 in. The air as it entered the plate was measured through an orifice in a thin plate located in an enlarged section of the supply pipe. When the plate was new, 150 cub. ft. of air per hour (measured under a water pressure of 8 ft.) required a nett head of 6 in. After the plate had been used for thirty days in a tank operated on the fill-and-draw plan, it was found that the same amount of air required a nett head of 15 in.

After forty days' use the following heads were required, the depth of sewage in the tank still being 90 in.:—

Air in cubic feet per hour (measured under pressure)	Head of water. Inches. Total.	Nett.
50	102·2	10·5
75	102·22	12·22
100	104·1	14·0
125	105·82	15·82
150	107·53	17·53
175	109·20	19·20
200	111·10	21·10

Where the plate is in a fill-and-draw tank, every time the air is shut off a certain amount of sewage filters through the filtros plate back into the air pipe, and it is reasonable to assume that a small amount of sludge remains in the voids of the filtros plate and reduces its capacity.

Where a tank was used for a continuous flow, the resistance of the plate was not found to increase to any great extent, and it is believed that if a continuous-flow tank were supplied with filtered air the resistance of the filtros plates would remain nearly constant for any given climatic condition. It was observed, however, that the humidity of the atmosphere had a decided influence on the capacity of the plates. When the air was moisture-laden the resistance of the plates was greatly increased. For this reason the use of a cheesecloth filter for the removal of dust from the air will give more satisfactory results than the use of an air washer. Such a filter will not remove as much dust as a washer, but a washer will cause an increase in humidity, unless some cooling device is used.

Tank No. 3 was equipped for about ten days with an aërator constructed of small brass tubing. This aërator consisted of a central head from which there radiated in a horizontal plane eight ⅛-in. brass tubes 6 in. long. An aërator constructed in this manner would work in a continuous-flow tank without any trouble, but when it was tried on a fill-and-draw tank it was found that the small tubes clogged up when the air was shut off and the sludge allowed to settle. As the water surface in the tank was lowered during the operation of drawing down the tank, the air held in the supply pipe between the valve and the aërator expanded and slowly escaped. Then when the tank was refilled the sludge was forced into the aërator tubes, and considerable difficulty was experienced in keeping this aërator cleaned out and in proper working condition.

All the mechanical difficulties of this could have been overcome without much trouble, but results of

* The remarks here given are from Mr. Sands' annual report, dated February 1, 1916.

analyses made during the time this aërator was in use show a decided loss in efficiency. This is attributed to the fact that the air is not as finely divided by such an apparatus as is by the filtros plate.

It is apparent that the operation of any large tank containing a great number of aërators requires careful consideration of the following conditions: When the air is turned on a few aërators will handle a large quantity of air unless each aërator offers considerable resistance. This air will diminish the hydrostatic head over these aërators, and consequently increase the effective head on the particular ones that start to work first. To eliminate this possibility it is necessary that each aërator shall contain sufficient resistance to prevent a few of them from discharging all the air that is intended to be discharged by the entire system. In other words, a certain resistance to the flow of air is absolutely necessary to insure a uniform distribution. Where the tank is 10 ft. in depth this resistance should be such that a nett head of at least 6 in. of water is required to discharge the amount of air that the aërating plate is designed to provide. If a type of aërator were used that did not require a 6-in. hydrostatic head to discharge the required amount of air, some other resistance would have to be used at each aërator; consequently the resistance offered by the filtros plate is of no disadvantage until it becomes greater than 6 in. It is believed that a proper filtros plate can be selected for any particular design that will afford the right resistance to insure uniform distribution, but it is necessary that air should be freed of all dust, and that the tank should be worked as a continuous-flow tank, or the resistance of the filtros plate will gradually increase, with a resultant loss of power.

ARMOUR AND CO., CHICAGO.

(Mr. G. L. Noble, Engineer-in-charge, Union Stockyards.)

The filtros plates that we had in our tank were admitted by the General Filtration Company to be of uneven porosity, due to the manufacture by an outside kiln firm. This resulted in the very rapid clogging of the finer plates, and this method of distribution was abandoned.

Perforated pipes were promptly installed, and have given good satisfaction. They are made of ¾-in. galvanised iron, and perforated with $\frac{1}{25}$-in. holes, 2 in. apart, and staggered. Cleaning is necessary only once in four months, and this cleaning can be accomplished in short order without interfering with the operation of the plant.

We have carefully studied all the data available for comparing these two methods, and have yet to be convinced that a porous plate is preferable to perforated pipe, when the matter is considered from every viewpoint. We expect (July 3rd) to install perforated pipes in our large experimental plants.

CLEVELAND

(Mr. R. Winthrop Pratt, Consulting Engineer, Department of Public Service, Cleveland.)

We have been running now (July 3rd) more than five months, and as yet have noticed no trouble which might be due to clogging of filtros blocks.

We hope and believe that with our type of blower, containing as it does a water trap through which the air must go, there will be no serious trouble from dirt or dust in the air entering the activated-sludge tanks.

ILLINOIS WATER SURVEY.

(Mr. Edward Bartow, Director, State Water Survey.)

In our experiments, operating tanks on the fill-and-draw plan for about a year, we have experienced no trouble from clogging of the filtros plates. On the fill-and-draw plan, however, the pores are cleaned by downward flow of the water, while the air is shut off during the settling period.

In our continuous-flow plant, about to be put in operation, we expect to filter the air through cheese-cloth, and we have made arrangements so that the air may be shut off and the water allowed to flow downward through the plates into a space from which it can be pumped. We can tell better after operating whether our precautions are satisfactory, but we do not anticipate any trouble from clogging of plates by impure air.

Automatic Lighting in Birmingham.—During the year ended March 31st last states Mr. H. E. Stilgoe, the city engineer of Birmingham, in his annual report, the automatic lighting system was extended to the lamps (1,200 in number) in the King's Norton, Northfield, and Yardley areas, making a total of 2,630 lamps automatically controlled in the city.

ROAD TARRING AND FISH LIFE.

THE PROTECTION OF TROUT STREAMS.

At the last meeting of the Hampshire County Council the Main Roads and Bridges Committee reported the receipt of a petition from a number of persons interested in the local trout fisheries protesting against a proposal to tar the roads in the valley of the Test.

"It must be admitted," said the petitioners, "that fish life in several rivers in England has been destroyed by tar having been placed on roads adjacent to the rivers. We are aware it is now considered possible to deal with tar in such a way as to make it innocuous to fish life, and that it is now the practice to construct gullies by the sides of the roads to act as filter-beds, but there is no doubt that in times of heavy rain or floods these precautions are rendered useless, and the pollution, although it may not actually kill the fish in the river, is sufficient to destroy their natural food, which, in the end, produces the same result. It is sometimes forgotten that pollution is caused not merely by the tar with which the roads are sprayed, but by the accumulation of petrol and other refuse which is collected on the roads, and with the first storm washed either directly into the river or into the hundreds of streams and ditches which connect with it, and which often form the spawning beds of the trout and the sources from which their food is obtained. We should be unwilling to suggest that our personal interests should stand in the way of any important public interests, but we do venture to suggest that the slight public advantage which might be gained by the tarring of the roads in the district named is not sufficient to justify the risk which would be run, as the fishing in the river Test is really a national asset, and if the fish life in it were destroyed, or even materially damaged, it would cause great depreciation in the value of property over a considerable district."

The committee stated that a representation had also been received from the Test and Itchen Trout Fishing Association, with regard to surface tarring on any roads the surface water from which might flow into the Test, Itchen or Anton, or the streams flowing into these rivers. The main road which was affected, as far as the Test Valley was concerned, was the Romsey and Stockbridge main road. Every precaution, said the committee, had been taken to use only tar purified to a very high standard. It was now urged that no tarring should be undertaken which might have the effect of destroying insect life in the subsidiary streams, and thus reducing the amount of food available for the fish. Surface tar was applied only where the road had been coated with granite or other hard material; and as at the present time a small portion only of the Romsey and Stockbridge road was so coated, there would not, in any event, have been extensive tarring carried out there. At a meeting between the committee and the petitioners, an agreement was come to as to five lengths of road which should not be treated with surface tar for the present, and this arrangement would have resulted in 5 miles 1,000 yds. being available for tarring so far as it was coated with hard material, and 3 miles 400 yds. being left untarred. Since the interview the association had asked for a further modification as to some portions of the road agreed to be suitable for tarring, and the committee had directed the county surveyor to make a further report with regard to these.

Mr. F. J. Hendy said he did not think the health of the inhabitants should be sacrificed to the interests of sport and the fish. Those living near main and district roads had to close their windows owing to the dust nuisance.

Sir William Portal remarked that the recommendations had been associated with the fishers in the county, but others who were equally interested in the matter were not actuated by selfish interests by any means, as had been suggested.

Colonel Stratton Bates said he thought the community ought to come before fish. An owner of fish said it was perfectly ridiculous to suggest that tarred roads injured fish. Out of hundreds of trout he had caught not one was in the slightest degree affected, and those caught were in splendid condition. All the surface water drained into the river, which was the clearest evidence that the tar did not harm. The fear of tarred roads was very much exaggerated.

Captain Seward suggested that it would be best for

all concerned to direct their energies to a peaceful solution of the difficulty by adopting a substitute for tarring.

Lord Portsmouth, who is chairman of the Salmon and Trout Association, referred to the experiments which before the war were being conducted at Fishmongers' Hall to ascertain the effect of tar upon the life of trout. As the hall had been given up for a military hospital the experiments had closed. They had an extremely able and scientific committee, and the experiments would be resumed as soon as possible. There was no doubt that tar, as they knew it, was deleterious to fish, of which they had absolute proof. He agreed that the interests of the public must come first in the long run; but in this complicated question it would be unwise to rush into a question which might involve heavy litigation and expenses.

The report was adopted.

MOTOR TRANSPORT IN EAST SUFFOLK.

A YEAR'S WORKING OF PETROL AND STEAM WAGONS.

During the twelve months ended March 31st last the four motor wagons owned by the East Suffolk County Council were kept constantly at work, one being almost exclusively employed on the conveyance of materials for the improvement and construction of roads for the military authorities, and the cost of hire refunded by the War Department.

In view of the scarcity of materials this arrangement has, says Mr. W. Jervis, the county road surveyor, in his annual report, proved beneficial, owing to the shortage of supplies for main roads, as it has kept the wagons constantly employed.

The wagons have proved their value, particularly during the present crisis, when difficulties would no doubt have arisen in getting the material carted as and when required, owing to the scarcity of men and horses.

The following is a statement of the work done by each of the four wagons:—

—	No. 1 petrol motor wagon.	No. 2 petrol motor wagon.	No. 1 steam wagon.	No. 2 steam wagon.
No. of days working ...	298¼	300	279½	251
No. of days on which wagons were not working, due to holidays, repairs, also washing out in case of steam wagons	19¼	18	38½	67
Total mileage	13371·2	16039·4	9011·2	6589·2
Total tonnage conveyed...	638·7	970·9	578·2	480·2
Total ton mileage ...	25382·5	36346·4	16697·9	24889·8
Average mileage per working day	44·83	53·46	32·24	26·25
Average tonnage per working day	21·42	32·36	20·69	19·13
Average ton mileage per working day	85·10	121·15	59·74	99·16
Average distance from base to point of distribution	4·21	4·39	3·05	5·48
Average tonnage per journey	4·26	5·	4·19	8·12
Average ton mileage per journey	16·96	19·23	12·1	42·11

Note.—The figure of 67 days, representing the time not worked in the case of steam wagon No 2, is partly due to the fact that this wagon cannot run when there is snow on the road.

Scarborough Bathing Pool.—At a recent meeting of Scarborough Town Council it was reported that the success of the new sea bathing pool had been such that it would be necessary to provide additional dressing accommodation.

Water Diviner Wanted.—Hoylandswaine, Yorks, Urban District Council have expressed agreement with the view of the medical officer that a permanent supply of water for the whole area under their control should be obtained, but, states a report, "need the services of a water diviner to locate the source of such supply."

THE PROBLEM OF DRIFTING SAND AT RHYL.

A CANCELLED CONTRACT.

The surveyor to the Rhyl Urban District Council, Mr. A. A. Goodall, presented recently a report on the subject of preventing sand from the foreshore and sandhills drifting on to the parades and into the streets of the town. Last winter the drifts were so heavy on the Marine-drive and East Parade that the roadway was rendered impassable for about a quarter of a mile, and the council entered into a contract to pay £600 for its removal.

Mr. Goodall stated that he had visited St. Annes-on-the-Sea to gather information as to how sand-drifts are dealt with there. At St. Annes the method has been to cover up the sand with tar-macadam and other pavings forming paths, to form alcoves for seats, to form artificial watercourses and lakes, and to plant the remainder of the area with star grass. The star grass planted at St. Annes was similar to the marram used at Rhyl, but stronger in the spike. A very important point was that the public were not allowed to make use in any way of the planted portions. This method has proved entirely satisfactory, and as a general principle Mr. Goodall strongly recommended it for the laying out of the sandhills eastwards of Bath-road to the boundary of Rhyl. He further recommended that the hills should be considerably lowered, and that a lake for model yachting, say about 300 ft. long, 150 ft. wide, and 12 in. deep, should be constructed adjoining Bath-road. The planting season would begin in September, and in order to render permanent the work now being done it should be pushed forward urgently.

The council decided not to entertain the question of laying out the sandhills as ornamental grounds, but they gave instructions that star grass should be planted as soon as practicable along the whole of the sandhills, without any alteration of levels. It was also decided to erect wooden sand screens to arrest the movement of sand in rough weather on the shore westwards from the pier.

The council confirmed an agreement which had been entered into with the firm of contractors who had undertaken the removal of the sand from the East-parade and Marine-drive and other parts of the front for the cancellation of the contract. Owing to difficulties over which they had no control, including the difficulty of getting labour, the firm had applied, under the "war clause" in the contract, to be released, and the council, in committee, consented on terms which were accepted by the contractors, Messrs. Bomford & Evershed.

Mr. J. H. Ellis stated that the Marine-drive and the East-parade had been practically cleared, and that about 10,000 tons of sand had been removed, at a cost to the council very much less than it would have been by the former method of removal by means of shovels and carts. Mr. Ellis said that one of the causes of delay in the carrying on of the work was that sand got into the bearings of the engines. The labour difficulty arose because the firm had obtained exemption for their men on the ground that they would be engaged in steam ploughing agricultural land, and that ploughing the sand as they were doing at Rhyl could not be regarded as a work of national importance.

In their letter to the council the firm said they much regretted the circumstances which had compelled them to relinquish the work, and they trusted that after the war if the council had other work to offer them they would find themselves in a more favourable position for carrying it out.

De-Tinning Company's Meeting.—Municipal engineers who, in addition to those whose names were given in our issues of the 11th and 18th inst., purpose attending the meeting in London next month arranged by the British De-Tinning Company, include: Messrs. Frank Harris (Tonbridge Rural), J. R. Treadwell (Easthampstead), George Riley (Wellington, Shropshire), W. A. H. Clarry (Sutton Coldfield), H. T. Mather (Surbiton), G. W. Holmes (Walthamstow), W. Osborne Thorp (Malvern), W. E. Ryder (Bushey), R. C. Moon (Nuneaton), W. A. Clegg (Dorking), R. H. Crummack (Dover), F. J. Voisey (Dartmouth), W. H. Grieves (Sutton, Surrey), and W. Farrington (Woodford Green). Torquay, while it may not be represented at the meeting, has expressed a wish to co-operate in the company's scheme.

Irvine and District Waterworks.

FERRO-CONCRETE IN NEW FILTRATION PLANT.

During the past ten years the consumption of water for industrial purposes in the area served by the Irvine and District Water Board, Ayrshire, has greatly increased, and at the outbreak of war a large additional supply became urgently necessary. The corporation of Paisley undertook to provide a supply during the emergency, and a line of pipes was laid from the Camphill reservoir of the corporation to the Munnoch reservoir of the Water Board. A large new main has also been laid by the board from the Munnoch reservoir to the filtering station, the cost being £19,000. An increase in the filtering plant also became necessary, and the board, after an exhaustive inquiry into the different methods of filtration, decided on the installation of the Paterson rapid filtration plant, which was inaugurated on June 28th last at the Greenhead filter station. The works recently constructed have altogether cost about £60,000, bringing the total capital expenditure on works to £275,000 in round figures.

Parliamentary powers have been obtained for a large reservoir on the Drum Burn, which is a tributary of the Caaf stream. The head waters of the main stream are to be conveyed into this proposed reservoir by a tunnel through the intervening hill. The capacity of this reservoir will be 420,000,000 gallons, and the estimated cost is £70,000. This new reservoir when completed will fully develop the Caaf gathering area, and will raise the total storage to 811,500,000 gallons.

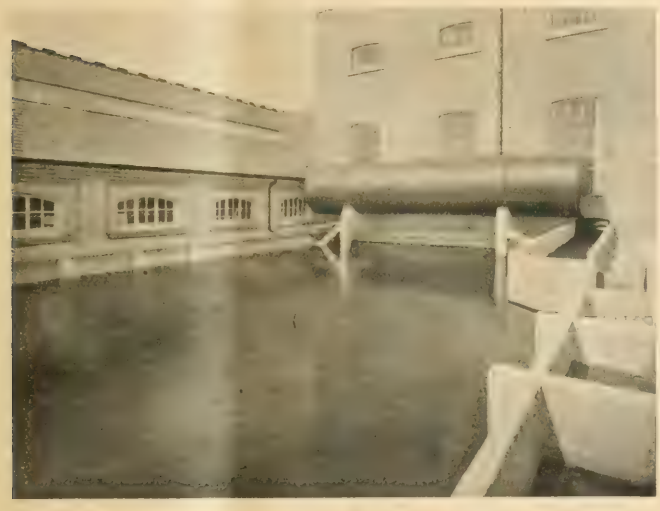

Fig. 1.—Precipitation Tank and Air Receiver, Irvine and District Waterworks.

The population at present supplied from the works is about 35,000, and the average daily consumption, including provision for industrial, sanitary, and all purposes other than domestic, is about 4,500,000 gallons.

The rental of the compulsory areas is £132,887, and the overhead domestic rate is 11½d. The trade rate is 5d. within and 8½d. outside the compulsory areas, subject to certain discounts to large consumers.

FILTRATION PLANT.

The new rapid filtration plant of 5,500,000 gallons daily capacity is housed in a brick building 136 ft. long by 38 ft. wide, placed alongside the existing slow sand filters. At the back of the filter-house is a tower which contains the gear for the preparation and supply of the reagents used for the purification process, and supports the wash-water tank at a height of 36 ft. above floor level. Situate on either side of the tower are the sedimentation tanks, each of 150,000 gallons capacity. The chemical reagents are stored in an annexe to the central tower. The tanks and various auxiliary structures in connection with them were constructed in Mouchel-Hennebique ferro-concrete, in accordance with working drawings prepared by Messrs. L. G. Mouchel & Partners, Limited, of Westminster.

Fig. 1 is a view showing one of the precipitation tanks, at one end of which is a compressed-air reservoir carried on ferro-concrete supports. The tank in question forms one of the group represented in Fig. 2. Sections and details of the tanks are given in Figs. 3 to 9.

Each sedimentation tank measures 52 ft. 2 in. long by 35 ft. wide by 15 ft. 6 in. deep inside, between the two tanks being the tower mentioned above. Figs. 3 to 4 illustrate the arrangement of the mixing trough and distribution channels along the upper side of the sedimentation tanks, as shown also in the photograph reproduced as Fig. 1.

The two series of five tanks in Fig. 2 below the sedimentation tanks are those containing the Paterson filter-beds. Each range of filter tanks is 63 ft. long by 25 ft. wide by 9 ft. 6 in. deep inside. A section through the sedimentation and filter tanks is given as Fig. 5.

Fig. 6 is a section through one range of filter tanks.

At the right-hand of this drawing may be seen the mixing trough and distribution channels along the two sides of the sedimentation tanks. Some interesting structural details of these will be found in Figs. 7 and 8. The former represents one of the counterforts through which passes the distribution channel, the part-section of a counterfort at the right-hand showing the manner in which the mixing trough is carried. The latter is a section through the same channel between two of the counterforts.

Fig. 9 is a section illustrating the construction of the supports for one of the compressed-air receivers.

The supply is a soft moorland water, containing varying proportions of organic matter in suspension, and having a brown peaty stain. Treatment with a coagulant is essential before the stain can be removed and a colourless supply obtained; and as the water is soft a trace of lime is added to restore the small initial temporary hardness and correct any plumbo-solvent tendency.

The 24-in. supply main entering through the north wall of the tower is coupled to a Francis type turbine situate on the first floor of the tower, which gives ample power for operating the auxiliary gear for the supply of wash water and compressed air, and for the preparation and distribution of the reagent solutions for the purification process. The turbine discharge, after passage through baffles to remove the surge, enters the measuring tank and overflows a 4-ft. rectangular weir, a Fluxograph giving a direct reading in gallons per minute of the amount passing, and a continuous record on a twenty-four-hour chart. A control float resting on the surface of the water in this weir chamber regulates the discharge of the coagulant (alumina sulphate) in direct ration to the amount of water passing, and its thorough mixture is secured in the passage of the water over the weir and through the mixing tanks (see Fig. 10). The water is then distributed to sedimentation tanks arranged on the right and left hand sides of the tower. These tanks are of sufficient capacity to allow over one hour for the completion of the reaction and the precipita-

tion of the heavier impurities before the water passes on to the filters.

The alumina solution is prepared in two 3-in. timber dissolving tanks, and afterwards discharged by an acid-resisting centrifugal pump into duplicate ferro-concrete storage tanks, each of 3,000 gallons capacity. To ensure uniform density of the alumina solution, arrangements are made for effective circulation of the contents of these tanks.

Three ferro-concrete lime-slaking pits are provided in the annexe. The slaked lime is formed into a smooth paste in the primary lime preparing tank, and the contents discharged to the secondary mill alongside the measuring gear. The supply of lime is controlled in a similar manner to the alumina solution, and arrangements are made for its addition either before or after filtration. Fig. 11 illustrates the lime pits and apparatus for its preparation.

There are ten open gravity filter units, each 24 ft. by 12 ft., with a total filtering area of 2,880 sq. ft. The filtering medium employed is a fine grade of specially sifted quartz sand, supported on a bed of pea gravel, and below this the manifold strainer system is arranged, with copper collecting tubes and bronze strainers. The filtered water discharges through the automatic outlet controllers into inspection boxes lined with white enamelled tiles, and overflows into the pure water channel, similarly lined, so that the colour of the effluent can be observed at all times.

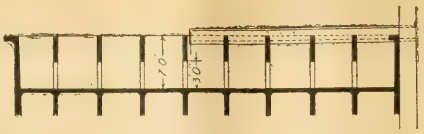

Fig. 3.—Part Longitudinal Section of Sedimentation Tank showing Mixing Trough and Distribution Channels.

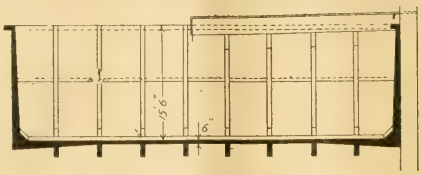

Fig. 4.—Longitudinal Section of Sedimentation Tank showing Exterior of Mixing Trough and Distribution Channels.

Irvine and District Waterworks.

The filter-bed is cleansed by first thoroughly agitating for two minutes with sterilised compressed air at a pressure of about 5 lb. per square inch; then a reverse current of cleansing water floats the loosened impurities into the central waste gutter, and thence to the drain. In this way each filter is thoroughly cleansed and restarted to work in a few minutes, but the controller may be so adjusted that the filter does not discharge purified water until ten or fifteen minutes later. This interval affords an opportunity for filming, and ensures a filtrate of the highest degree of purity.

All the valves and fittings are so arranged that the entire filtering and washing operations are controlled from the front gallery.

The filtered water for washing purposes is raised by a centrifugal pump into the filtered water storage tank of 30,000 gallons capacity, carried on the top floor of the central tower. The compressed air is drawn through a reducing valve from two air storage reservoirs, 6 ft. diameter by 30 ft. long, supported over the precipitation tanks. The wash-water pumps and air compressors are arranged in duplicate, and a 28-h.p. oil engine is installed as a stand-by in case of breakdown of the turbine. Fig. 12 is a view of the filters from the upper platform.

In response to urgent demands, the contractors undertook to give a supply of 3,000,000 gallons of filtered water per day within six weeks after the foundations were completed ready for them to commence. This necessitated their laying down temporary pumping and power plant outside the filter-house, making special water and drain connections to the plant, and the use of an extra rich concrete mixture to ensure very rapid setting of the tankwork. The work was completed and the supply available within the stipulated time.

A Glossary of Road Terms (By H. Percy Boulnois. M.Inst.C.E., St. Bride's Press, Limited, 24 Bride-lane, E.C. Price 2s.) —Mr. Boulnois has achieved far more than he may imagine by this production of his pen. He set out to standardise the nomenclature of road terms; in addition he has made a valuable addition to English literature. To the untutored it is like reading a new language; Mr. Boulnois says it isn't anything like "complete." At any rate, it is a valuable *vade mecum* which no one has attempted before.—*Portsmouth Times.*

EAST SUFFOLK ROADS.

LACK OF MATERIALS, LABOUR AND TRANSPORT.

In his annual report, Mr. W. Jervis, county road surveyor of East Suffolk, states that the total expenditure on the main roads maintained directly by the county council, excluding salaries and travelling expenses, amounted during the year ended March 31st last to £31,867, equal to £100·57 per mile.

Mr. Jervis mentions that the abnormal weather conditions, particularly the heavy rainfall in February and the heavy snowfall in March, seriously affected the main roads. Tenders were invited, and the quotations received were subject to stipulations having regard to the conditions obtaining. It had been quite impossible to obtain supplies, owing to the heavy demands of the War Office and the shortage of labour, and, in fact, deliveries from many sources of supply absolutely failed. The price of material increased, and a greatly reduced quantity could only be obtained under the circumstances. The shortage of materials, labour, &c., necessitated the curtailment of improvement work, with the result that judicious and substantial patching had to be resorted to in order to save the roads from serious deterioration. The greatest number of men employed in one fortnight was 147, and the least number 96, while the average staff numbered 125. These numbers showed a reduction when compared with the previous year, owing to the enlistment of several of the men, and the drafting of others on to work in connection with the construction and improvement of roads for the military authorities. The staff would be still further reduced by the calling up of men eligible for military service.

SURFACE TARRING.

The treatment of the main roads with tar was continued and extended to sections recently surfaced. Apart from the advantage of the treatment on hygienic grounds, and as a preservative, it is also observed, Mr. Jervis points out, that snow disappears more quickly from a tarred road surface than from an ordinary surface. An area of 1,048,513 sq. yds. was treated during the year, at a cost of £5,769.

HEAVY MOTOR TRAFFIC.

Attention is called by the county surveyor to the increasing burden on the ratepayers by the extensive use of the roads of the county by heavy motor wagons. "The tendency is," he says, "for this class of traffic further to increase under present war conditions, as, the railway company being in an unfavourable position to carry merchandise, goods are being delivered by road. The military authorities have also in daily use heavy motor vehicles for transport of supplies, &c., throughout the county for the daily requirements of the troops. The Local Government Board Departmental Committee on Road Locomotives and Heavy Motor Cars has only heard part of the evidence to be submitted to it, and its report will no doubt be postponed under the present circumstances. It was anticipated, when the Road Board reconstruction scheme, 1912-16, was embarked upon, that it would have been completed by the end of the financial year 1915-16, and under normal conditions the work would have been finished within the estimated period. For obvious reasons, however, the progress has been unavoidably slow since the outbreak of war, and the scheme is still incomplete; but, notwithstanding difficulties in the Lowestoft and Eye districts of the county, the work is well advanced and nearing completion. The great increase in the volume of heavy traffic now using the main roads supports the contention that the reconstruction scheme was a very wise policy to adopt, as it is not too much to say that the main trunk roads would have been unable to sustain the present heavy traffic if several miles had not been strengthened, as provided for in the reconstruction scheme."

Concluding his report, Mr. Jervis says the utmost difficulty has been experienced in obtaining materials, labour and transport, and in consequence the estimate has been underspent to the extent of £10,736. The shortage of materials has curtailed the reinstate-

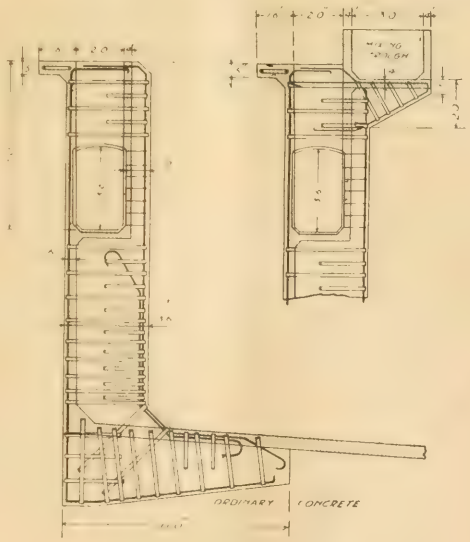

Fig. 7.

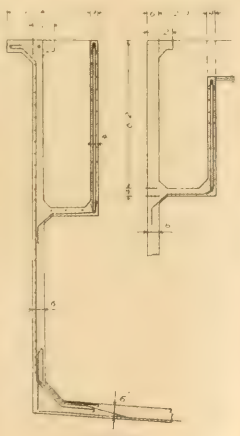

Fig. 8.

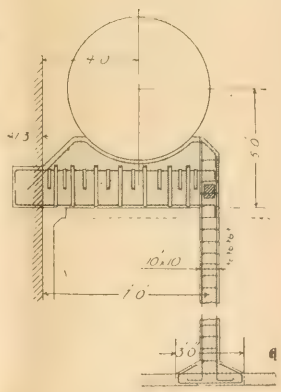

Fig. 9.

Details of Distribution Channel, Mixing Trough and Support for Compressed Air Receiver, Irvine and District Waterworks.

ment of the ordinary wear and tear, and has prejudiced the condition of the main roads. The very heavy traffic and extensive use of the main roads by the military, together with most unfavourable weather conditions, have caused deterioration of the main roads. Several sections of main trunk roads were, fortunately, completed under the reconstruction scheme before the outbreak of war, and are giving good results, notwithstanding the strain of military traffic. The cost of reinstatement has greatly increased, and the enforced retrenchment in the main road expenditure will mean a heavy expenditure after the war, as work will be greatly in arrear, and the roads will have to be strengthened considerably to carry the increased heavy traffic.

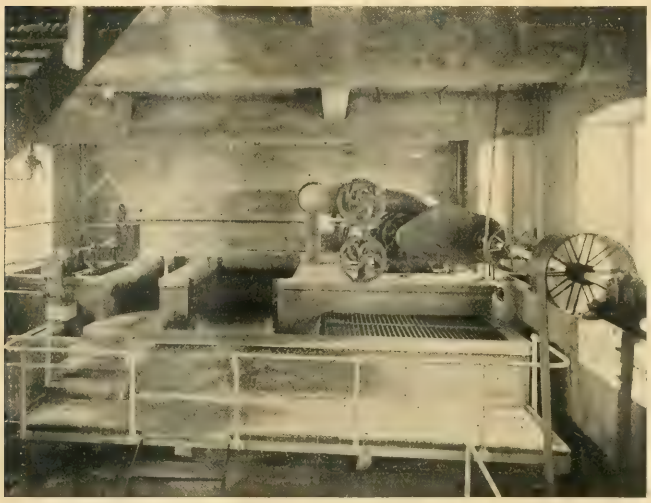

Fig. 10.—Weir Chamber, Turbine and Reagent Supply Gear, Irvine and District Waterworks.

Linking Up of Electricity Supplies.—The recent letter of the Board of Trade requesting electric supply authorities to link up as much as possible in order to conserve coal supplies has been followed by action. A committee has been formed to deal with the many undertakings in Lancashire and Cheshire, and a similar committee has now been formed in London, consisting of representatives of all the London borough councils, fifteen companies, and eight municipalities outside the London area, with the object of co-ordinating the existing supply

Jointing of Drain Pipes.—Now that the prices of building materials are higher than they have been for many years past, a few words on one method of economising will no doubt be welcomed by our readers. It has been customary to use neat cement for jointing drain pipes, whereas if Pudloed cement and sand are used a saving of about 14s. to 15s. for each ton of cement used is effected. We learn that this latter method was adopted on Lord Dunraven's sewerage scheme in County Kerry, and on several other sewage schemes. The makers of Pudlo will be pleased to send particulars of this economical and much safer method of making sanitary pipe joints to any interested readers.

JOHANNESBURG SANITARY SERVICES.

In Johannesburg house refuse is removed in petrol-driven motor lorries and two-wheeled open tipping carts. At each of the upper corners of each cart is fixed a ring, and for each cart a waterproof tarpaulin is supplied, which is secured to the rings. The medical officer of health, Dr. Charles Porter, has more than once suggested the provision of dust-carts with flap covers, to prevent the blowing about of rubbish, but the manager of the scavenging department, after considering various types of covered dust-cart, prefers the tarpaulin arrangement, as it admits of the cart taking a larger load, and saves the considerable weight of a wooden cover. An average of 762 Scotch cartloads per day of house refuse was collected in the twelve months ended June 30, 1915; some of it was burnt at the destructors and some deposited at tips.

As regards the disposal of nightsoil, Dr. Porter in his annual report states that the average number of pails removed per night was 17,230. Every pail, before being sent out, is washed, tested for leakage, dipped in boiling creosote in steam-jacketed pans, and, after the surplus creosote has dripped off in such a way that it is collected and available for use again, is "nested" with other pails and placed in the carts for distribution.

Street sweeping is done in the night-time, except during the wet season, when it is postponed to the early morning, so as to get the mud off the streets just before the day's traffic commences. An average of 10,643 mule loads were removed by 101 Scotch carts each month. The expenditure under this head for 1914-15 was £22,633, but, subject to financial considerations, this service might, in Dr. Porter's view, with great advantage be considerably increased.

OFFICIAL REPORTS.

The Editor invites readers to forward regularly copies of annual and other reports, for notice in the columns of "The Surveyor."

SOME RECENT PUBLICATIONS.*

The Mechanical Handling and Storing of Material. By G. F. Limmer, assoc.m.inst.c.e. Price 42s. nett. London: Crosby Lockwood & Son.

That part of the present work which deals with the subject of handling, although based on the author's monograph (now out of print) on "The Mechanical Handling of Material," has been thoroughly revised and brought up to date by the addition of several entirely new chapters. In making the revision, it was found that the storing or stocking, and, conversely, the reclaiming of material (a subject which was formerly treated as of secondary consideration) are now so much bound up with mechanical handling that it would be undesirable, if not impossible, to keep the two subjects apart. Hence the present comprehensive volume, which may fairly claim to contain all the available information on this most important matter. As is pointed out in the introductory chapter, the application of machinery both to the handling and conveying of heavy and bulky material has of late years assumed a paramount interest. No branch of engineering has so rapidly developed in modern times as the construction of appliances for conveying, loading, and unloading heavy goods, more particularly coal and ore. In the case of grain and seeds, again, the construction of granaries and silo-houses on a large scale has been undertaken, and the aid of automatic machinery more or less sought to provide means of handling this material without the assistance of hand labour. It is therefore eminently necessary that engineers should more than ever devote their attention to economies that may be effected by mechanical handling and storage. Mr. Limmer's work is comprehensive in character, its main divisions being (1) continuous handling of material; (2) continuous handling of material by pneumatic and hydraulic means; (3) intermittent handling of material; (4) unloading and loading appliances; (5) miscellaneous installations; and (6) the automatic weighing of material. The volume contains 744 quarto pages on art paper, and is profusely illustrated and well indexed. It is well-nigh indispensable to those who are concerned with the handling of material on a large scale.

Fig. 12.—Filters from Upper Platform, Irvine and District Waterworks.

Machine Design. By A. W. Smith and G. H. Marx. (4th edition.) Price 12s. 6d. nett. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Limited.

In the preface to this book the authors point out that the whole subject of machine design cannot be treated exhaustively in a text-book of ordinary dimensions, owing to the almost infinite variety of machines in existence. The object of the work therefore is simply to state the principles that underlie all machine design, and to suggest methods of reasoning which may be helpful in the designing of any machine. The five considerations of primary importance are stated to be adaptation, strength and stiffness, economy, appearance, and safety, and these principles are kept well in view throughout. The fourth of these principles is stated in language which might have been used by Ruskin himself: "There is a *beauty* possible of attainment in the design of machines which is always the outgrowth of a *purpose*. Otherwise expressed, a machine to be *beautiful* must be *purposeful*." The authors have done their work thoroughly and well, and this new edition, like its predecessors, may be recommended with confidence to students, who should, however, possess a fair knowledge of pure and applied mathematics before reading it.

The Operation of Sewage Disposal Plants. A manual for the practical management of sewage disposal works, with suggestions as to improvements in design and construction. By Francis E. Daniels, director of water and sewerage inspection, Board of Health of the State of New Jersey. Price $1·50. Published by *Municipal Journal*, New York, U.S.A.

Although published for the use of sanitary engineers and sewage works managers in the United States, and dealing with some methods of treatment which are little known in this country, this book contains much information and many suggestions which should be of interest and value to those who have charge of sewage works here or who have to design sewage disposal works. The chapter dealing with grit-chambers and screens is very interesting in many ways, but particularly in the descriptions it gives of the various methods of screening and kinds of screens which have been tried from time to time. Again, in describing the various systems of preliminary treatment in tanks, there is much valuable information deserving careful study. The sewage works manager who is a chemist will be interested in the chapters on testing stations, and on making physical, chemical and bacterial tests; and the engineer in the treatment adopted for securing the greatest possible digestion of sludge, and for its final disposal. Above all, it is obvious from the text that the author is a thoroughly practical man, and that the information he gives and the suggestions he makes are based entirely upon his own personal experience. We can strongly recommend this book to all who are interested in sewage disposal.

Water Supply in the St. Thomas Rural District.—A new water supply for Topsham, in the rural district of St. Thomas, Devon, was inaugurated recently. The well and pumping station of the new supply are situated between Newcourt and the main Exeter road. The well, which is 61 ft. deep, and has a diameter of 8 ft., is lined in order to keep out surface water, the new supply being obtained from the red sandstone. From the bottom of the well extends a borehole, which goes down another 130 ft., giving a total depth of 191 ft. An average continuous yield of 120,000 gallons per twenty-four hours without exhausting the borehole was obtained during a fourteen day and night trial made before the well was constructed. The water is lifted by three-throw pumps (Beck & Co., London), driven by oil engines (Ruston, Proctor & Co., Lincoln) to a water tower about three-quarters of a mile away. The works were designed and superintended by Mr. Sidney R. Lowcock, M.Inst.C.E., M.I.Mech.E., Westminster.

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

Road Direction Signs.*

By C. H. COOPER, M.Inst.C.E., Borough Engineer, Wimbledon.

Highway traffic forms such a part of a nation's economy that every means tending to reduce the cost of haulage deserves careful study.

Direction signs were desirable in the past; with the introduction of mechanical haulage, signs, such as can be read without stopping, have become a necessity.

Take for instance the driver of a van distributing goods from a store. With animal traction, his journey from home could not exceed 12 miles, so that the area he could traverse might be taken at 450 square miles. With mechanical haulage this driver could take journeys of 80 miles over some 20,000 square miles of country. This man might have a fair idea of the smaller area, but he could have no useful knowledge of the greater. With animal traction he could obtain information relating to the shorter journey from those he met on the road and at the inns, where he and his horse receive refreshment.

Fig. 1.—Information that Appears on a Semaphore Arm or Plan of Road.

Such means of information is useless for the journeys he now takes. A system of direction signs must therefore be devised to enable him to determine his route without stopping or materially reducing his speed. Such a system would effect an economy in the time of transit that would several times pay the cost it would involve.

It may be argued that drivers should consult maps, but map-reading is an art difficult to acquire and beset by many pitfalls to the best readers. To the majority of drivers maps give information as to the routes to be taken, but without direction signs such drivers would be unable to follow their route.

The information given by the writer's signs relative to each road consists of a top line giving the principal town to which the road leads, and its distance, while the bottom line gives the nearest town or village and its distance. No other writing appears (see Fig. 1). It is of importance that the information should be given in a standardised form, so that the driver knows what to expect when he reads a direction arm.

If necessity ever was the mother of invention, then a certain junction of cross-roads in Kilcowanmore, Co. Wexford, is the father of the writer's signs, as illustrated in the Christmas Number of the *Car*, 1913. For months after the writer's limbs bore evidence that the crossing was difficult for those unacquainted with its intricacies. Had the writer observed a semaphore plan on the approach to such crossing, he and his cycle would have been saved the injuries they sustained, and the night have been spent in more genial surroundings than a neighbouring inn.

It may be well to consider what railway practice has adopted to caution drivers before negotiating a crossing—namely, a distant signal placed at a distance from the crossing proportionate to the speed allowed, and a home signal near the crossing, thereby giving the driver two cautions before the crossing is reached.

It might in certain cases be well on a highway to adopt a distant signal in order to attract a driver's attention, but the multiplication of signs is not desirable. The writer points to the fact that on a railway a driver receives his caution before reaching a crossing, whereas on a highway, a driver is allowed to reach a crossing, where he runs the risk of colliding with approaching vehicles, and is at the same time expected (1) to find which direction arm refers to his route, and (2) to read the directions thereon. To do this a driver has to slow down, and in many cases actually stop.

The writer contends that a driver should know the nature of the crossing he has to negotiate, and the road that leads to his destination, before he reaches such crossing, so that he may concentrate his attention on the avoidance of approaching traffic, which in most cases does not come under his observation until the crossing is reached.

The writer proposes to supply the information either by means of (*a*) a semaphore plan, or (*b*) an actual plan. When semaphore plans are adopted, a plan of the crossing, as seen by traffic approaching, is placed in each road leading to the crossing at a distance of 100 ft. therefrom. The sole object of the sign is to give, in the simplest form, the necessary information to onward traffic. With 3-in. letters on an arm the sign can be read at a distance of 200 ft.—*i.e.*, 300 ft. from the crossing. Travelling at 20 miles per hour, a driver would have 7 seconds in which to read the sign, and 3 seconds after passing the post to consider before reaching the crossing, 10 seconds in all, which seems ample if we consider that only 15 seconds is allowed on tube railways for stopping to discharge and take up passengers.

A semaphore plan is said to attract attention better than an ordinary plan, and may be simpler for the uninitiated to read, but, if generally adopted, complete plan signs would soon be understood.

When a single lantern can be seen from all roads approaching a crossing, the writer suggests that a lantern be so placed that a face is opposite each road, and on each of these faces is depicted a plan

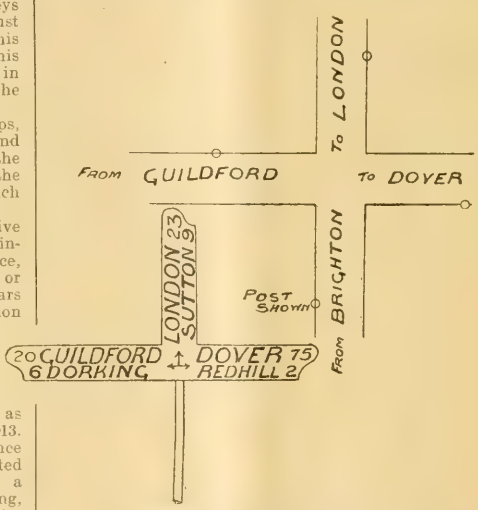

Fig. 2.—Semaphore Signs Applied to Four Cross Roads.

of the crossing as seen from the particular road it is opposite. The writing on these plans allows of its being read at a distance of about 240 ft.

A complete plan has many advantages over a semaphore plan, as it shows bridges and obstructions to the view, such as houses, &c., which assist a driver in avoiding accidents.

The writer considers that whatever system of signs may be adopted it should be applied as universally as possible. Great Britain should have but one system. When life depends on the reading of a sign, drivers should not be confused by having to read more than one system. In his paper he makes no reference to other systems, preferring that each author should describe his own system.

The writer claims that his system acquaints a driver with what he has to negotiate before the negotiations take place, which is essential in order

* From a paper submitted at the recent annual meeting of the Institution of Municipal and County Engineers at Blackpool.

to avoid accidents. He also claims that he supplies the necessary information in the simplest form possible.

THE PROPOSED RESTRICTIONS UPON TRACTION ENGINES.

A SUFFOLK PROTEST.

The Highways Committee of the West Suffolk County Council recently invited the opinion of the council upon a resolution from the Suffolk Farmers' Union, which body protested against the proposed restrictions upon traction engines put forward by the County Councils Association.

Mr W. Bigg moved that the council should adopt the resolution, which was that the prohibition of bands on the front wheels and crossbars on the hind wheels would, if carried into effect, render the traction engine practically useless for agricultural purposes.

Mr. E. J. Rolph said the local branch of the Farmers' Union was unanimous on the matter.

Asked by Mr. Lake if the iron bands did very much harm to the road, the county surveyor, Mr. W. L. Jenkins, said the county surveyors around London supported the idea, but surveyors as a whole realised it would be impossible to do away with the bands.

Mr. W. R. Hustler said he did not think the agricultural traction engine did any harm to the main county roads, though it might to the bad rural roads. A heavy traction engine carting three tons of bricks, however, did a great deal of harm to an ordinary road.

Mr. G. Townsend said he defied any man to steer an engine without bands on the front wheels. They would do more harm to roads without the bands than with them.

The resolution was adopted.

BUILDING PROGRESS IN SHANGHAI.

It is interesting to note that, however great the slump in the building trade may have been in Great Britain since the war commenced, the local contractors in Shanghai have no cause for complaint, as, despite the enormous increase in the price of nearly all building materials, the boom which commenced in 1915 still continues, plans having been approved for no fewer than 6,829 structures of an estimated value of £622,816 during 1915 and 1,584 structures of an estimated value of £485,447 during the first six months of the current year.

Contrary to expectations, the buildings now being erected are of a more permanent nature than has hitherto been the case, particularly where they front a principal thoroughfare.

It would seem that, despite the large number of Chinese dwelling-houses and other buildings which are being and have been erected of late years, the supply is still below the demand, which is not surprising when one takes into consideration the fact that the population has grown from 501,541 in 1910 to 638,920 at the end of 1915 an increase of 137,379.

The building inspection staff has a peculiarly difficult task to perform, owing to the local artisan being relatively inexperienced. The amount of inspection necessary will the more readily be understood from the fact that during the last few years a monthly average of 250 blocks of buildings under construction in different parts of the Settlement has been maintained.

For some time past it has been felt that the existing building rules are inadequate, and a new set more in line with modern requirements is being drawn up by a local commission appointed by the municipal council.

Apart from buildings erected under permits issued by the municipal council, municipal buildings, such as new central offices, hospital, fire stations, schools, &c., to the value of £202,625 are at present in course of construction.

Glasgow Cleansing Department.—On the occasion of a recent inspection reference was made to the satisfactory results obtained from the estates under the control of the Glasgow Corporation Cleansing Department. Bailie Robert Mitchell spoke of the success of the cropping on the estates, which had been improved by the depositing of the city refuse, and mentioned that for last year there was a profit of nearly £3,000 on the cropping account of Ryding and Robroyston estates. The year's hay crop, he said, was exceedingly good, and they had also oats, wheat, barley, turnips, and potatoes. In connection with the collection of waste paper, they had the assistance of the Women's Volunteer Reserve. For the paper they now received 65s. per ton, as against 4s. at the time that the department first took up the work.

HIGHWAY MAINTENANCE IN THE BELPER RURAL DISTRICT.

The maintenance of the 162 miles of highways in the Belper rural district during the year ended March 31st last cost, after making certain deductions, £4,673, or £29 4s. 1½d. per mile.

The estimated cost of maintenance for the year was £5,350, the actual expenditure thus, Mr. Robert C. Cordon, the engineer and surveyor, points out in his annual report, showing a saving of £677.

STEAM ROLLING.

During the period covered by the report the council's steam roller consolidated 5,300 tons of stone over an area equal to 61,000 super. yds. of roadway, approximating to 1 ton to every 11½ yds. of road, and an average of nearly 27 tons of stone rolled daily.

Below is an analysis of the days worked by the roller:—

	Days.
Actual working days	197
Washing out boiler	24
Under repairs	21
Travelling over district	14
Standing for frost, &c.	52
Holidays	6
Sundays	52
	366

The expenses with the roller were:—

		Rate in pence per ton consolidated.
Engine driver's wages ...	£88 ...	3·98
Sweeper's wages	52 ...	2·35
Lad attendant	16 ...	0·70
Carting bind, water, &c. ...	112 ...	5·07
Coal	16 ...	0·70
Oil, waste, &c.	7 ...	0·31
	£291	13·11

Coast Sand Dunes (By Gerald O. Case, St. Bride's Press, Limited, 24 Bride-lane, E.C., price 5s.).—Mr. Case has done a valuable work in the writing of this book.—*Southport Guardian.*

Cape Town Main Drainage.—The corporation of Cape Town are inviting tenders for the carrying out of contract No. 1 (main sewage pumping station), in connection with the main drainage of the southern suburbs of that city, as follows: Section No. 1, pumps, motors, switch gear, cables, &c.; section No. 2, cast-iron pipes and sluice valves, &c.; section No. 3, penstock gates and screens; section No. 4, overhead travelling cranes; section No. 5, tipping wagons and rails; section No. 6, fitter's expenses and contingencies. General conditions, specifications, drawings, forms of tender, &c., can be obtained from Messrs. Davis & Soper, 54 St. Mary-axe, London, E.C., the agents of the corporation, and tenders must be delivered not later than September 18th next.

Drying and Conservation of Timber by Electricity.—*Indian Engineering* reproduces from a Swiss building trade journal some interesting particulars of a method of drying and conserving timber by means of treatment by electric current which is being tried on the Continent with success. It appears that the effect of passing a strong electric current through freshly cut timber causes a chemical change producing rapid oxidation of certain parts, combined with a physical change in the cellulose and its numerous derivatives, which renders them better able to withstand the action of fungi, while increasing its suitability for mechanical use. It also confers an aseptic quality to the sap elements remaining in the timber. The "Nodon" process, as it is called, is claimed to be so effective that in a few hours a thorough oxidation of the wood-sap takes place, a process which, in free air, would require several months; the process reduces the hygroscopic tendency of the wood so that it no longer readily absorbs moisture. The process can be applied to green timber with such success that in a few weeks a thorough seasoning takes place. A certain amount of moisture helps to carry the electric current through the timber, so that the process is best applied to timber in a not too dry condition—in fact, as soon as practicable after felling. It can be applied in the forests where the felling takes place, thus reducing transit weight. The electrical energy required is 3 kw. to 6 kw. per cubic metre.

ROAD UPKEEP IN BIRMINGHAM.

COST OF TAR-SPRAYING.

In the period covered by the last issued annual report of Mr. H. E. Stilgoe, the city engineer, the total area of macadam surfaces tar-sprayed in Birmingham was 2,426,029 super. yds.; the area sprayed a second and third time was 135,224 super. yds., making an area of street equal to 2,290,805 super. yds., comparable with a length of 177¾ miles.

The cost of the work was £10,126, being at the rate of 1·001d. per super. yard. In the previous year the rate was ·911d.

The application of tar to the macadamised street surfaces has effected a saving in repairs, maintenance and scavenging, and is continuing to give satisfaction.

WOOD PAVEMENT.

An area of 125,487 sq. yds. of wood pavement is under maintenance contract with the Improved Wood Pavement Company. The amount paid during the year for maintenance was £4,398, being at the rate of 8·41d. per square yard, this payment covering according to contract the cost of entire renewals where necessary.

The approximate area of wood pavement maintained directly by the corporation is 203,314 sq. yds., the cost of which during the past year was £2,040, being at the rate of 2·40d. per square yard. This figure refers to repairs and cost of renewals where necessary.

During the winter 31,160 loads of snow were removed at a cost of £5,095—a rate of 3s. 3d. per load.

There are 641½ miles of roads in the city of Birmingham.

ROAD BOARD'S EXPENDITURE.

THE EFFECTS OF THE WAR.

The sixth annual report of the Road Board, which was issued on Wednesday, shows that applications were made during the year ended March 31st last for £310,261, of which £297,038 was for improvement of road crusts. The advances applied for show a decrease of £1,691,003 as compared with the previous year, and of £2,283,544 as compared with 1913-14, the decrease being due to the reduction in the amount of work undertaken by highway authorities in consequence of the war.

In February of this year, following the withdrawal of the Retrenchment Committee's suggestion that grants for road improvement should be entirely suspended, and the arrival at a decision to prevent serious deterioration of roads of real importance, the board circularised county authorities intimating that the aggregate amount of loans or grants for the financial year 1916-17 for this purpose would not exceed £200,000, to be confined mainly to refined-tar treatment.

Besides the construction of new roads and the improvement of private roads for the military authorities, the board have undertaken similar work for the Admiralty and Ministry of Munitions. The estimated cost to June 30th last is £1,809,621.

Examination for Highway Engineers.—An open competitive examination for senior highway engineers—open to all male citizens of the United States who meet the requirements— has been announced by the United States Civil Service Commission. The purpose of the examination is to establish an eligible list from which vacancies will be filled in the office of Public Roads and Rural Engineering, Department of Agriculture. Remuneration is from £400 to £800 per year, candidates obtaining a rating of 85 per cent or over being eligible for appointments to positions carrying salaries of £600 or more. Applicants must be thirty years of age, be physically fit, and must have had not less than four years' preliminary engineering experience, or must be graduates in engineering from a recognised college. Eight years of responsible engineering experience are required, of which five years must have been in highway work. Competitors will be examined on the following subjects, which carry the relative values indicated: Education and preliminary training in engineering, 20 per cent; responsible experience in engineering and fitness, 30 per cent; responsible experience in highway engineering, 50 per cent.

MOTOR-'BUSES AND THE ROADS.

To the Editor of The Surveyor.

Sir,—The scale showing the rate of payment per 'bus per mile or 'bus per annum, in your issue of the 18th instant, may be regarded as satisfactory or unsatisfactory, depending upon the point of view. It would be interesting to know what are the bases on which the figures have been arrived at. On the face of it there is a distinct encouragement to continue the use of granite, limestone and other water-bound roads, and the discouragement of specially constructed either wood paved or asphalt roads, which, I note, are given place of honour—*i.e.*, as being the most satisfactory.

Local authorities have power to maintain highways, but there is no stipulation as to how they should maintain them or with what material. If an accident occurs to a vehicle through the condition of the road, it having been very badly worn, the local authority is not liable; so that we may conceive of a local authority spending the £152 received from the 'bus on the roads that it traverses and doing no more. An adjoining local authority may, on the other hand, think that it is in the public interest to put down the specially constructed road at a greatly increased initial cost, and instead of receiving £152, the sum is at once reduced to £57. The £152 may be considered to be the amount per mile that would be received if there were 'buses running either way at the rate of one every twelve minutes. The average cost of the maintenance of main roads in this country is £120 per mile, so that under these circumstances the local authority would be receiving from the 'buses which traverse the roads at the rate of one every twelve minutes 30 per cent more than the average cost of the maintenance of the main roads of this country.

The £57, the ¾d. per 'bus per mile which is put forward as the charge on wood pavements, would be a very nice source of income for the local authorities who have a large number of 'buses passing over the roads.

For example: On the Fulham-road in the Broadway, 1914, the total number of 'buses per annum would be 632,000, the income on a ¾d. basis would amount to £980, whereas the total cost of the pavement, together with the repairs, works out at £598, and the proportion of the 'buses to the other traffic is only 29 per cent.

In another case the cost of the pavement is £437 per annum, and the percentage of motor-'bus traffic is 10 per cent, yet we should have received £360 towards the cost of repairs.

It is quite evident, therefore, that the amount of wear caused by motor-'buses to wood-paved roads is at a much lower rate than ¾d. per mile. It will also be evident that if three 'buses pass a certain point every minute, as they do at the town hall, Fulham, during certain parts of the day, the income that we should receive per mile per road would be £2,052.

I venture to suggest that no engineer can bring forward a road which costs, or would cost, even under such circumstances, as much as £2,052 per mile.—Yours, &c.,

Francis Wood, M.Inst.C.E.,
Borough Engineer and Surveyor, Fulham.

August 22, 1916.

THE SETTING OF CONCRETE.

To the Editor of The Surveyor.

Sir,—In your issue of August 18th I notice, under the heading of "Things One Would Like to Know," a paragraph with reference to concrete. I might say that I was told some years ago that if I allowed the mixed concrete to remain on the banker for an hour or two before it was laid I should have a quicker setting and a better result. This I tried, but the result was not satisfactory. The concrete was laid in a footpath, and a dozen bays which were laid in this manner all became mottled on the top soon after the foot-passengers were allowed over it, whereas the bays adjoining, which had the concrete put in immediately after mixing, kept a very smooth appearance, and were perfectly satisfactory in every way. Of course, I am not going to say that it would be a failure every time after it has been mixed two hours, but the weather conditions are everything; for instance, to mix concrete and leave it on the board for two hours in a broiling sun would, I feel sure, be very detrimental. The best thing is to get it spread as soon as possible, and, if necessary, keep it damp for a considerable period.—Yours, &c.,

W. Matthews Jones,
City Surveyor, Chester.

August 22, 1916.

PREMATURE BURIAL.

To the Editor of The Surveyor.

Sir,—The allusion to cremation in your excellent journal of 11th inst., under "Things One Would Like to Know," reminds one that the existing system of giving death certificates without personal medical verification of the fact of death by means of scientific tests is a very unsatisfactory guarantee against the burial of living, though apparently dead, persons. It is this amazing defect in the law which the Deaths and Burials Bill aims at removing, and not being a party question it will, it is hoped, soon be considered by Parliament and placed on the Statute-book. This will, however, greatly depend upon the amount of material and moral support that is received by the Association for the Prevention of Premature Burial, the promoters of the Bill.—Yours, &c.,

Jas. R. Williamson.

100 Chedington-road,
Upper Edmonton, N.
August 18, 1916.

THE LIMMER AND TRINIDAD LAKE ASPHALT COMPANY, LIMITED.

We are informed that arrangements have been completed for the amalgamation of the Limmer Asphalte Paving Company, Limited, and the Trinidad Lake Asphalt Paving Company, Limited, under the name of the Limmer and Trinidad Lake Asphalt Company, Limited.

The combined company will be responsible for the completion and fulfilment of all work in progress and contract obligations that have been undertaken by either company.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor readers with a view to making the information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars have reached us during the present week. Other reports will be found on our "Local Government Board Inquiries" page.

ADMINISTRATION.

Stone U.D.C. The council have received copies of the County Council Health Committee's report, in which the county medical officer, Dr. G. Reid, makes reference to certain sanitary defects in the township. Referring to the sanitary staff, the medical officer says: "The sanitary staff consists of an inspector who is also supervising medical foreman, who superintends the general work. In a town of the size of Stone it is quite easy, under present circumstances that the post of surveyor and sanitary inspector should be held by one man, but I must point out that the present officer has no clerk, and a large portion of his time is consequently occupied in correspondence and other routine clerical work, whereas his time ought to be fully occupied with strictly professional work."

BUILDINGS.

Bristol T.C. The Health Committee recommend the Port Sanitary Authority to build a small hospital on a site belonging to the corporation at Chapel Pill.

Okehampton T.C. The council have accepted a tender, at £373, for carrying out improvements to the cattle market. A tender has also been accepted for building a wall round the council's land in George-street.

Oldham T.C. It is proposed to construct an underground convenience in Mill-street.

Ottery U.D.C.—Upon the recommendation of the surveyor, Mr. H. Forster, it has been decided to replace the bridge at Whiphay in steel and concrete at an estimated cost of £180.

West Suffolk C.C. The council have accepted the tenders of Mr. R. J. May of Norwich, at £321 (for foundations) and £151 (for concrete work) in respect of the rebuilding of Waste Water Bridge, Hengrave.

HOUSING AND TOWN PLANNING.

Abersychan U.D.C. The council are again appealing to the Local Government Board to sanction a loan for a housing scheme, urging that accommodation is required by miners and others.

Atherton U.D.C. It is proposed to purchase a site for the purpose of a housing scheme.

Coventry T.C. Of the 100 houses being erected by the corporation at the corner of the city boundary near Stoke Heath, about thirty new houses are ready and the remainder are nearly completed. The rents range from 5s. 6d. to 11s. 6d. a week. It is hoped to continue the houses on the site, and it is possible that the Housing Committee will seek powers to erect this number while the present Act is in force.

Huddersfield T.C. As the result of a visit by a Local Government Board inspector with respect to the scheme for 1,000 houses in the Lockwood district, it is understood that the Housing Committee have been instructed to deal generally with the matter.

Mexborough U.D.C. The Building Committee have been asked to report on the advisability of preparing a housing scheme after the war.

Selby U.D.C. The question of the new houses which have been proposed by the special committee, and which have arisen during the recent enquiry of work, was considered at a special meeting of the council on Wednesday. Sixty-two houses are proposed to be erected, and it was decided to complete the scheme by purchasing a piece of land at Scott Hall Farm, Selby, for the erection of 28 houses. The land is to be purchased at £50 per acre. The site for the remaining houses proposed will be on the Flaxley Road estate, the property belonging to the Rev. Canon Hall. The new scheme was known as [illegible] and provided over 100 houses for the working classes.

MOTOR TRANSPORT.

Coulsdon and Purley U.D.C.—A sub-committee of the Fire Brigade Committee recommend the purchase, at a cost of £600, of a motor chassis to be fitted to a body estimated to cost £70.

Leeds T.C.—A 3 ton motor lorry is to be purchased for the use of the Waterworks Committee.

Millom U.D.C.—The Highways Committee have adopted a recommendation in favour of the purchase of a steam wagon.

Ongar R.D.C. It is proposed to purchase a motor ambulance at a cost of £170.

Southend T.C. The combined Health and Highways and Works Committees have decided to consider the question of traction haulage after the termination of the war.

Stratford-on-Avon R.D.C.—The council are considering the question of purchasing traction wagons.

REFUSE COLLECTION AND DISPOSAL.

Docking R.D.C. The Local Government Board have sanctioned a scheme for the scavenging of Ringstead, and the council have referred a scheme for Heacham to the parochial committee of that district.

Southend T.C.—The town council refused to confirm a proposal of the Economy Committee to reduce the estimate for the removal and disposal of house refuse from £8,750 to £7,750. The medical officer reported upon certain complaints which he had received as to the need for a more frequent collection of house refuse from certain boarding-houses in the borough, and it was resolved that the borough engineer and surveyor, Mr. E. J. Elford, should be authorised to apply to the tribunal for the exemption until the end of the "season" of such men as he may consider to be necessary to carry out this work efficiently.

ROADS AND MATERIALS.

Birmingham T.C.—The corporation have over fifty women engaged as street workers. They are mainly occupied in preparing the road surfaces for tar-spraying, and they are reported to be doing the work satisfactorily. During this summer 131 miles of road have been tar-sprayed, against 121 in the previous summer.

Blean R.D.C. It has been agreed to apply for powers to make up Lancaster-gardens and Osborne-gardens, Reculver, under the Private Streets Works Act, 1892.

Cheadle and Gatley U.D.C.—The surveyor, Mr. F. R. Gibbins, has been instructed to make up the approach road to the sewage disposal works.

Dartford R.D.C.—The Road Board have offered to meet half the cost of surface-tarring a number of roads, conditionally upon necessary repairs being effected.

Docking R.D.C.—It has been agreed that the road-men employed by the council who remain on the roads during the harvest shall be paid at the rate of £1 10s. per week for one month during that period.

Farnham U.D.C.—A scheme has been approved for the widening of Bear-lane, two owners of property having conveyed the necessary land for this purpose.

Hayle U.D.C.—It has been agreed to adopt the proposal of the Road Board that the council should contribute £100 towards the repair, estimated to cost £700, of the road from the viaduct to Hayle Bridge.

Horsham U.D.C.—A letter was received from the Aldershot and District Traction Company, Limited, asking whether the council would favourably consider a proposal to run the company's motor omnibuses into Horsham from Guildford, *viâ* Bramley, Cranleigh, and Rudgwick. The county surveyor, Mr. H. W. Bowen, wrote suggesting that a conference of the highway authorities of West Sussex should be held to deal with the question of new omnibus routes, and the extent of compensation. It was agreed to support the proposed conference, and the chairman and clerk were delegated to attend as delegates.

Kesteven C.C.—The county surveyor, Mr. W. B. Parker, reports that the amount expended on the main roads for the year ending March 31st last was £23,220, which is only to be expected in an expenditure of less than £21,000 in ordinary times, owing to the great increase

in price of materials and rate of wages. It really means that some 60 per cent. of work estimated to be necessary for the year under report had not been carried out and so far as could be seen at present it would be impossible to carry out all the proposed works during the ensuing year. It was useless to disguise the fact that consequently there would be more deterioration than usual, and eventually a somewhat heavy expense would be incurred in overtaking the arrears of work. It would appear, therefore, to be a good policy to accumulate all the unexpended balances to meet the heavy cost of reinstatement later on.

Kiveton Park R.D.C. The council are seeking powers to make up Long Street under the Private Streets Works Act, 1892.

Newmarket U.D.C. The Road Board in a letter to the council, have expressed their pleasure at the entirely satisfactory manner in which the contractor, Mr. W. H. Lay, has carried out the work in connection with the construction of a military camp road in the district, and intimated their desire to grant Mr. Lay a small honorarium.

Newry No. 2 R.D.C. It was reported on Saturday that only one of the five road maintenance proposals which were passed at the quarterly meeting had been tendered for. Eight special works appeared on the sheet, but not one of these was tendered for. It was resolved that the Armagh County Council should be asked to give all the proposals not tendered for into the hands of the county surveyor for execution, with one exception.

Nuneaton T.C.—The Road Board have promised a grant of £300 towards the cost of macadamising the main roads. It is proposed to provide a macadamising plant at an estimated cost of £300, including the erection of a shed.

Phillack U.D.C. An engineer representing the Road Board has estimated that the cost of repairing the road from St. Erny School to Loggans will be £1 800 and the cost of repairing the road from Loggans to the old arsenic works £1 200. The council have decided to consider the question of making a contribution to these and other works when it is placed before them formally by the Road Board.

Plymouth T.C.—The Works Committee are considering a recommendation of the Sanitary Committee to make use of salt water for street watering.

Skipton R.D.C. The council are in communication with the county council with respect to a scheme for improving the county road at Beamsley.

Southend T.C.—The Health Committee have called the attention of the Highways and Works Committee to the necessity for more frequent watering during the season of the many visitors to the borough.

Surrey C.C. It was reported that plans and estimates had been prepared in respect of 265 dangerous corners out at 197

SEWERAGE AND SEWAGE DISPOSAL.

Abingdon T.C. A scheme is under consideration for carrying out sewerage pension at an estimated cost of £1,000, plans of which have been prepared by a commercial firm extending the acreage of the sewage farm.

Adlington U.D.C.—The council have appointed the proposals of the surveyor, Mr. R. Edge, for the improved treatment of the sewage at Fair View Farm.

Clowne R.D.C.—It has been decided to provide bacteria beds in connection with the outfall at Creswell.

Lymington T.C. A special meeting is to be held to consider the sanitary arrangements in May avenue. The medical officer of health, Dr. J. Rendall, having advised that the houses should be connected with the sewer. A report has been received from the Local Government Board respecting the complaints as to nuisance arising from the discharge of sewage at Oxey. The board, it was intimated, had decided that the outlet must be closed and the flushing pipe connected to the main outfall pipe. The town council are in communication with the board as to the best method of procedure to be adopted.

Oswestry R.D.C. A letter has been received from the military authorities stating that they have decided to do away with the necessity of contractors to deal with the sewage from the Park Hall hutments and pumping it out to the contract farm, the council would then cease.

Warmley R.D.C.—Owing to persistent complaints the council have instructed the medical officer to [illegible] at the various outfalls at the [illegible] Bath Corporation [illegible] is prejudicial to health.

WATER, GAS, AND ELECTRICITY.

Chesterfield T.C.—The town council are applying to the Local Government Board for authority to carry out extensions to the electricity works.

Earby U.D.C. It is proposed to provide at an estimated cost of £800 a gas supply for the district and to instal a disposal works.

Horsham R.D.C.—A proposal is being considered for the purchase of the South Sussex Gas and Water Company undertaking for the sum of £2 500.

Huddersfield T.C. It has been decided to instal plant for the distillation of tar at the gasworks.

Ripon T.C. It is proposed to provide new retorts at the gasworks at an estimated cost of £450.

Rochdale T.C.—A sub-committee of the Works Committee have been authorised to report upon a proposal to spend an estimated sum of £50,000 upon the extension of the electricity works.

Rochford R.D.C. The surveyor, Mr. H. T. Sidwell, has received instructions to report upon a proposal for the improvement of the Canewdon water supply.

Stalybridge T.C. A scheme is to be prepared for the provision of a coal-tar and benzol recovery plant at the gasworks.

MISCELLANEOUS.

Aberdeenshire C.C. It was reported to the Garioch District Committee that in regard to the fixing of the salaries (travelling allowance, &c.) the Local Government Board had sent a letter intimating that they did not propose interfering in the matter of increasing expenses. They took no exception to the arrangement proposed, but they asked that the minutes should be amended to show a note of the expenses to be incurred, and at the end of next year the Board would see what steps should be taken for the future.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

APPLICATION FOR LOAN.

Aldershot U.D.C. £1 000 for the construction of an underground convenience.

LOAN SANCTIONED.

Rochford R.D.C. £3 317 for sewerage works.

FORTHCOMING INQUIRIES.

RHONDDA URBAN DISTRICT COUNCIL. [illegible] and sewage works. The sewerage works can be [illegible] and will be offered for tender by persons or firms [illegible] Engineer to the Council, to whom application should be made for particulars as to details, &c., and Form of Tender. Completed Tenders are to be received by the 12th September next.

E. HAZLEDINE BARBER, Assoc. M. Inst. C.E., Engineer and Surveyor.

County Offices, Pontypridd. August 23 1916. £367 4.

THE TOWN COUNCIL of the BOROUGH of DEVIZES [illegible] proposal about to be [illegible] Offices for purchase of the [illegible] be sent to the Borough Surveyor [illegible] Devizes, by Friday, 1st September [illegible]

PERSONAL.

Mr. A. E. Bush, surveyor and sanitary inspector to the Beeston Urban District Council, has resigned after twelve years' service.

Mr. George Lapwood, surveyor to the Romford Rural District Council, who has undergone an operation, is progressing satisfactorily.

Mr. E. Leslie Wright, architectural assistant in the Mansfield borough surveyor's department, has joined the Forces.

Mr. J. E. Crowson, assistant surveyor, has been appointed surveyor to the Peterborough Rural District Council.

Mr. J. B. Sobey, surveyor to the Southern District of the Liskeard Rural District Council, has had his salary increased by £25 a year.

Mr. Robert B. Leach, electrical engineer and tramways manager to the Heywood Town Council, has been appointed to a similar post at Loughborough.

Mr. A. Cooke, Little Hulton, Bolton, has been appointed surveyor to the Darfield, Yorks, Urban District Council, at a salary of £120 a year.

Mr. Isaac Matthews-Jones, for nearly forty years city surveyor of Chester, and now retired, has been bereaved, we regret to state, by the death of his wife, which took place at Southport.

Mr. J. Walsh, county surveyor of Louth, has had his salary increased from £300 to £400 a year, and Messrs. J. Dromgoole and J. M. Lyons, assistant surveyors, have been voted an advance from £130 to £150 each.

Mr. Hardy, surveyor to the Whitley Upper (Yorks) Urban District Council, has received a vote of sympathy from the council upon the death of his son, Mr. Henry Hardy, in the war. Mr. Hardy only recently lost his wife.

Mr. George Lee, assistant county surveyor of Galway, has been appointed county surveyor for the Eastern Division of the county. Mr. Michael A. Martin, Portumna, has been appointed temporarily to fill the position in the Western Division vacated by Mr. Lee.

Mr. C. H. Cooper, M.INST.C.E., the borough engineer of Wimbledon, whose paper on road direction signs, read at the annual meeting of the Institution of Municipal and County Engineers, at Blackpool, is reproduced in this issue, is one of those men who is never happy unless working on an independent line. It was when he took up motoring that he realised the necessity for readable direction signs and to meet the need devised the system illustrated in his paper. In consequence of the troubles met with in the lubrication of internal combustion engines, Mr. Cooper designed a system by means of which the lubricant to each cylinder is independently controlled and only admitted at the end of the explosion stroke so as to minimise the deposit of carbon (Patent No. 15,374). Reference to maps when on the road, especially on a wet and windy night, is one of the things that has troubled our friend. But to meet this difficulty he has devised a watertight holder which, in a space of 9½ in. by 9½ in. by 2 in., contains maps to a scale of 2 miles to the inch, covering 120 by 72 miles of country, all of which may be referred to without opening the case and can be read at night by electric lamps contained in the case (Patents Nos. 3,980 and 13,787). Mr. Cooper's inventions in connection with the card index and the treatment of sewage will be recalled by many of our readers.

OBITUARY.

Mr. R. G. Hawke, for some years surveyor and inspector to the Glossopdale Rural District Council, died recently, we regret to state.

With deep regret we learn of the death, which occurred on Monday morning last, of Mr. Frederic William Manuelle, of the firm of A. & F. Manuelle, granite quarry owners, and marble and stone merchants, Bishopsgate House, E.C. The business will be continued under the same name as heretofore, and Mr. James Leigh, who has been connected with the company for the past forty years, will continue to act as manager.

KILLED IN ACTION.

Private Norman Howard, Royal Fusiliers (Public Schools Battalion), killed in action on July 20th, was the elder son of Alec and Annie Howard, of Petrograd. Before joining the Army in September, 1914, he was associated in business with Messrs. Joseph Jackson & Son, civil and mining engineers, Wood-street, Bolton. He was a fellow of the Surveyors' Institution.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Are not some municipal authorities relying on a rather quicker termination of the war than is likely to take place? Was it, for instance, prudent of the Lewes Town Council to keep down their district rate to a normal 2s. in face of the recommendation of their Finance Committee to raise it to 2s. 1d. in the £? Is it not more than possible that even when peace comes the spending value of the £, which is now only 12s. 6d., will be still further reduced owing to the rise in wages and commodities which always follows after a war of any duration?

* * * *

Has not the world of housing, as well as that of politics, lost a very useful man by the death of Sir Arthur B. Markham? Is it generally known that he was a thoroughly practical social reformer, and was "justly proud," as stated in the *Westminster Gazette*, of the garden city he had erected at Woodlands, in Yorkshire, for the miner class? Will not the solution of this at present almost insoluble problem of sufficient housing accommodation be eventually found in the activities in this direction of large-minded men of Sir Arthur's type, and not through the Socialistic idea of State-aided dwellings, which contains so many troublesome pitfalls?

* * * *

Is not a surveyor sometimes placed in a very awkward position when he asks his council to apply to the tribunal for the exemption from national service of one of his staff whom he deems to be indispensable, and the council decline to take any action? Was not this evident in a recent case in Sussex where the surveyor asked for the exemption of a road foreman, and one of the councillors remarked that he would "rather see the roads go to pot than that men should be kept back from the Army"? Is there not, however, a great deal to be said in favour of this remark, when it is considered that our one object at the present moment is to win the war, and that if wholesale exemptions are allowed this might prove impossible.

* * * *

Why is it that gargoyles on Cathedrals and other ancient buildings nearly always depict hideous or grotesque abortions? Is it that even the stonemasons of those far-off days realised that there is something blatant and egregious in a "spouter"?

* * * *

Are there not two remarkable facts that strike an intelligent observer when looking down upon London from, say, the dome of St. Paul's Cathedral? First, the large number of green trees that can be seen dotted about everywhere between the roofs of buildings, and, secondly, the absence of black smoke from the factory chimneys? Should not this latter fact be a source of congratulation to the members of the Smoke Abatement Society?

* * * *

Why was it that, according to the *Dublin Evening Herald* of the 2nd inst., some of the members of the Rathmines Council should have been so much exercised in their minds about the street lighting, which, apparently, for purposes of economy only, was to be reduced during the month of August? Are these councillors aware that in England there are a considerable number of towns, larger than Rathmines, which have to put up with this inconvenience, not only for reasons of economy, but because we are at war?

* * * *

Is not Dr. Caldwell Smith's suggestion for the destruction of the larvæ of flies a good one? Could anything be more simple than to spray house refuse and dustbins with a mixture consisting of half a pound of soft-soap, half a pint of paraffin, and a pint of water? Is it not very satisfactory to read that, after many experiments, Dr. Caldwell Smith found this simple, and cheap, remedy perfectly efficacious?

REINFORCED CONCRETE ROAD CONSTRUCTION.

By W. Matthews Jones,
City Engineer, Chester.

[The following extracts are from an article which appears in the latest issue of "Road Reinforcement," the artistic little booklet which the manufacturers of the B.R.C. Fabric, the British Reinforced Concrete Engineering Company, Limited, Manchester, publish from time to time.]

I have come to the same conclusion with regard to concrete roads as our American friends have done, and in Chester I am going very strongly to advise my council, when the war is over and men and materials are obtainable, to go in for reinforced-concrete roads as the standard type for Chester.

I have seen other concrete roads than those laid in Chester, but I do not agree entirely with their method of construction, neither do I agree, in many cases, with the way that the reinforcement is laid in the concrete which is used for road-foundation work. The method generally adopted for this is to take a roll of the reinforcement, unroll it for its whole length (50, 75, or 100 yds., whichever it may be) on that portion of the roadway already excavated, and then to place 2 in. or 3 in. of concrete on the top of it, and raise the reinforcement up through this so as to be this distance away from the underside of the concrete. This method, in my opinion, is entirely wrong, because the work cannot be done satisfactorily in this manner, neither do I agree with the stronger bars of the reinforcement being laid in the same longitudinal line as the roadway, and I do not think I can do better than give a very short statement of what I do in Chester.

In the first place I take into consideration the traffic likely to use the road to be laid; secondly, the nature of the soil underneath on which the concrete is to be laid. Having arrived at these facts, I then consider the thickness of the reinforced concrete to be used, get this fixed in my own mind, and set to work. In reinforced-concrete roadwork it is a great mistake to have your broken granite all of one size—that is, say, 1-in., 1½-in., or 2-in. mesh, or whichever the surveyor may decide on is required for the road surface. What I do is to get my stone of the various meshes in proportion—that is to say, 1 ton of 2-in. mesh, 1½ tons of 1½-in. mesh, 1½ tons of 1-in. mesh, 1½ tons of ¾-in. mesh, and 1 ton of ¼-in. mesh. These I have tipped together and turned over in a dry state, the same as turning over the concrete. When they are properly mixed I then make my concrete in the proportions of 5, 6, or 7 to 1, as the case may be. This when thoroughly mixed makes a far better conglomeration or matrix than having stones of the various sizes put in according to their mesh. What one wants is a solid piece of work, with no voids of any kind, but one homogeneous mass.

If the substrata or soil underneath the concrete is wet or of clay, I spread 2 in. of ashes first, and on this spread out 2½ in. or 3 in. of concrete for a length of anything from 25 to 50 yds. by the full width of the carriageway. By this method it will be observed that the bottom layer of the concrete is laid to an even thickness, and on this I place my reinforcement, not with the stronger bars the longitudinal way of the street, but transversely across the carriageway. The reinforcement sheets being 7 ft. in width, I cut off the lengths to fit the carriageway, and take great care that where two edges join one another in the longitudinal section these are properly wired together by bending over the thin portion of the reinforcement one to the other. Having put this area down, and while the concrete underneath is quite fresh, I then proceed to put on my top layer. This is roughly trammelled over, and is brought to a fairly good surface by the men using their spades, and is left in this condition without any floating, the rough concrete being brought to the required height. I might say that I generally allow the wet concrete to be brought up ¼ in. higher than the finished level required, and this allows for any consolidating which may go on through its own weight or evaporation of the water.

Water Economy in London.—Sir John Wolfe Barry has called attention to the waste of water in London, and Mr. E. B. Barnard, chairman of the Metropolitan Water Board urges greater economy by consumers. The rise in the cost of coal and the increase of wages, he stated, has increased the expenditure of the board by £174,000. The water charges of the board are fixed by statute.

MUNICIPAL WORK AT BRISTOL.

POINTS FROM CITY ENGINEER'S REPORT.

In consequence of the war and the urgent need for the exercise of economy, the report for the year ended March 25th last of Mr. Lessel S. McKenzie, Assoc.M.Inst.C.E., the city engineer and surveyor of Bristol, contains very little beyond a description of ordinary maintenance work. The expenditure for the year out of revenue was £226,063, as compared with £242,209 in the year immediately preceding the war. Included in this expenditure is a sum of £5,633 paid in allowances to the men who have joined the colours, and another £1,500 paid in war bonuses, so that the actual saving on work amounts to £23,269, notwithstanding the fact that there have been increases in the rates of pay and in the price of materials.

ROAD WORK.

A considerable amount of road and paving work has been carried out at the request of the Road Board, acting for the military authorities, the value of this amounting to about £3,630.

Trial lengths of bituminous roads laid in various parts of the city are still very satisfactory; but, under present conditions, any extension of the work is out of the question. However, unless the price of timber should drop considerably, it may be necessary, Mr. McKenzie states, to consider the substitution of bituminous material for some of the worst of the wood paving, some of which is getting into very bad condition.

The macadam roads have not been allowed to go back, it being considered a sounder policy to keep them, as far as possible, in good repair. Tar-painting the surface was again carried out over a very large area and on looking through previous reports it is satisfactory to note that in 1906—the last year before the introduction of this treatment to the Bristol roads—the number of loads of road sweepings and slop carted away was 80,597, as compared with 58,410 during the year under revision, and that the number of loads of water used for street watering was 135,657 against 58,799 loads.

Two Laffly petrol-driven rotary brush machines have been running for twelve months, and are very satisfactory. They are more efficient than horse machines, and the city engineer anticipates a saving of at least £150 per annum on each machine.

SATISFACTORY STEAM LORRIES.

In connection with the equipment of plant for the construction of bituminous roads, two steam lorries were purchased from the Yorkshire Commercial Motor Company, of Leeds, at a total cost of £1,090, and have been engaged continuously on work being carried out by the corporation for the Government. Each lorry has a total length of 16 ft. 3 in., and width of 6 ft., with a wheel base of 9 ft. 9 in., and weighs 2 tons 19 cwt. The carrier is lined with sheet steel, is fitted with mechanically-operated tipping gear, and carries 3 tons. The working steam pressure is 175 lb. per square inch, and the speed is up to 12 miles per hour. The road wheels are of the "Artillery" type, and are fitted with solid rubber tyres.

Up to the present the lorries have given complete satisfaction.

During the period covered by Mr. McKenzie's report private streets of a total length of ·98 of a mile were made up, at an average cost of 9s. 9·72d. per foot of frontage.

In the laying of pitched sett paving in old highways the area covered by 1 ton of setts averaged 4·09 super. yds.

To streets already paved with wood an area of 1,085 super. yds. of Jarrah paving was added during the year, making the area of wood paving in the city maintained by the corporation 243,032 super. yds. The macadamised carriageways in old highways recoated and relaid was about 70½ acres, equivalent to a length of about 27¾ miles, with an average width of 7 yds. Of this work about 10¾ miles was in macadam treated with tar and other compounds.

The average area covered by 1 ton of stone in recoating was about 12½ super. yds.

HORSE HAULAGE.

As regards the work done by the corporation and hired horses, Mr. McKenzie states that each horse worked on an average 310½ days during the year, the average number of loads hauled per horse being as follows: Street cleansing, 3·73; ashing (removal of house refuse), 2·79; street watering, 14·92; material-

for paving, pitching, macadamising and sewers, 4·50. The stone hauling is done by contractors: the total number of tons hauled during the year was 27,365, the average cost per ton being 1s. 6d.

The cost for forage per horse per day averaged 2s. 8·55d., the highest outlay in any one week having been 3s. 6·83d., and the lowest 2s. 3·19d. per day. The average cost of bedding was 1·56d. per horse per day. The cost per horse per week averaged 19s. 10·77d., compared with 13s. 1·36d. during the period prior to the war.

During the year the total amount of refuse destroyed at the corporation's two destructors was 57,842 tons, and the amount of clinker obtained was about 35 per cent, or a total of 20,346 tons.

ELECTROLYTIC DISINFECTING FLUID AT POPLAR.

Since the installation by the borough council, ten years ago, of a plant for its manufacture, 418,779 gallons of electrolytic disinfecting fluid have been manufactured at Poplar at a cost for electricity of £450, and materials £381—under ¼d. per gallon.

In his report for the year 1915, Dr. Frederick William Alexander, the medical officer of health, states that the fluid has been in great demand by the public at the various depots from which it is distributed. The quantity manufactured was 36,985 gallons, but before distribution the fluid was broken down to half strength.

COST OF MATERIAL AND ELECTRICITY.

The cost of material in manufacturing 36,985 gallons of the electrolytic fluid was as follows:—

	£	s.	d.
Electricity, 7,776 units at 1½d. per unit	48	12	0
Chloride of magnesium, 3¼ tons ...	19	13	9
Salt, 55½ tons ...	9	3	7
Caustic soda ...	5	8	0
Water ...	1	13	11
Total cost of materials to produce 36,985 gallons ...	£84	11	3
Electric motor for stirring: 210 units ...	1	6	3

BOTTLES, CORKS AND LABELS.

Bottles ...	16	19	0
Corks ...	9	0	0
	£25	19	0

The public health department is not only furnished with the disinfectant and the various institutions of the council (the public baths, &c.), but the institutions of the managers of the sick asylum and of the board of guardians (within and without the borough) are supplied with an unlimited quantity free.

For the fluid supplied to the works department, a charge of 1d. per gallon is made; the public health department is credited with this amount although no actual monetary transaction takes place.

As applicants now usually bring their own receptacles to the depots there is a very appreciable saving in the expense on bottles alone.

From October last for electrolytic disinfectant supplied to manufacturers and trading concerns, a charge of 8d. per gallon has been made through the electricity department, the electricity undertaking being allowed an amount of 10 per cent for establishment charges.

Some 660 gallons were supplied to four London County Council public elementary schools for spraying and cleansing floors of class rooms.

The fluid continues to be added to the water in the swimming baths in the same quantity and strength as before—viz., 1 part of chlorine to 2,000,000 parts of water. Some 3,487 gallons were supplied to the Poplar Baths, 2,925 gallons to the Bow Baths, and 1,461 gallons to the Island Baths, making a total of 7,873 gallons.

Canadian Waterworks.—Canada has spent approximately £25,000,000 on waterworks. In 1850 there were only three plants in Canada; in 1875 there were 15, and in 1900 there were 235. There are now 528 plants, of which 109 were built between 1910 and 1915. The period showing the greatest activity in the construction of such plants was between 1905 and 1910, when no fewer than 122 new plants were placed in operation. The average daily consumption for all towns and cities in Canada is 111 gallons per capita.

ELECTRIC VEHICLE DEVELOPMENTS.

RECHARGING STATIONS.

An indication of the increasing popularity of the electric-battery vehicle is to be found in the announcement that the British Thomson-Houston Company, Limited, and Messrs. Willans & Robinson have made arrangements at Rugby for the charging of electric vehicles. Parenthetically, we might mention that the General Vehicle Company, Limited, of Imperial House, Kingsway, W.C., are arranging for a zone of recharging stations around London and other big cities. This is a material consideration to those who are contemplating the addition of an electric to their existing fleet of motor vehicles.

MUNICIPAL TRAMWAYS ASSOCIATION.

ANNUAL MEETING PROGRAMME.

The annual meeting of the Municipal Tramways Association will be held at the Surveyors' Institution, Westminster, on Thursday and Friday, September 21st and 22nd.

The proceedings will open at 11 o'clock on the Thursday, when Mr. Peter Fisher, general manager of the Dundee Corporation Tramways, will deliver his presidential address.

The following papers will be submitted for discussion:

"Some Notes on Passenger Transportation in Large Cities," by Mr. J. M. McElroy, general manager of the Manchester Corporation Tramways.

"Utilisation of Tramways for Goods Traffic," by Messrs. G. W. Holford, general manager of the Salford Corporation Tramways, and W. Clough, general manager of the Bury Corporation Tramways.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

HIGHWAY SURVEYOR.—August 26th.—Claypole Rural District Council. £150.—Mr. A. J. Franks, clerk, 24 Lombard-street, Newark.

SURVEYOR'S ASSISTANT.—August 26th.—Hemel Hempsted Town Council. £80 to £100, according to experience.—Mr. W. R. Locke, borough surveyor, Town Hall, Hemel Hempsted.

GAS AND WATERWORKS MANAGER.—August 28th.—Devizes Town Council. £200 per annum.—The Town Clerk, Devizes.

ASSISTANT ENGINEERS.—August 28th.—Port of London Authority.—Chief Engineer, 109 Leadenhall-street, London, E.C.

SURVEYOR AND INSPECTOR.—August 28th.—Seaton Delaval Urban District Council. £150 per annum.—Mr. W. D. Soulsby, clerk, 3 Stanley-street, Blyth.

ELECTRICAL ENGINEER.—August 28th.—Corporation of Heywood. £200 per annum. — Mr. G. G. Bouchier, town clerk.

ASSISTANT IN SURVEYOR'S OFFICE.—August 29th. — Leek Urban District Council. — Mr. W. E. Beacham, engineer and surveyor, Town Hall.

SURVEYOR AND INSPECTOR.—September 1st.—Beeston (Notts) Urban District Council. £225 per annum.—Mr. W. H. Redgate, clerk, Bentinck Buildings, Wheeler Gate, Nottingham.

COUNTY SURVEYOR'S ASSISTANT. — Somerset County Council. £120 per annum.—Mr. Gordon R. Folland, acting county surveyor, 13 Chamberlain-street, Wells, Somerset.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

BELFAST.—August 28th.—For the erection of a central tuberculosis institute, for the corporation.—Messrs. Young and Mackenzie, architects, Scottish Provident-buildings.

ROAD MAKING.

REINFORCE CONCRETE ROADS WITH
EXPANDED METAL.

EXMOUTH SEA DEFENCE WORKS. Expanded Steel Concrete Slope and Roadway. Length 1 mile; total width of Roadway, 65 feet.
Mr. SAMUEL HUTTON, Urban District Council Engineer and Surveyor

THE EXPANDED METAL COMPANY, LIMITED
(Patentees and Manufacturers of Expanded Metal).
Head Office: YORK MANSION, YORK STREET, WESTMINSTER, LONDON, S.W.
Works: STRANTON WORKS, WEST HARTLEPOOL.

Straker-Squire

For

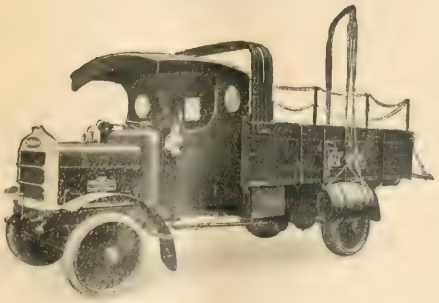
This Petrol Motor Gully Wagon in the service of the Borough of Southwark is effecting a saving of 20 per cent.



5-Ton "Straker-Squire" Wagon supplied to Messrs. Bristowe & Co., of Westminster, S.W., for dealing with tar in barrels.

to suit PUBLIC WORKS requirements.

Telephone: Hop 369 & 370.

STRAKER-SQUIRE (1913), LTD.,
56—NELSON SQUARE—56
Blackfriars, LONDON, S.E.

Telegrams: "Rhomboidal, Friars, London."

RATHDRUM.—August 28th.—For the erection of a cottage, for the rural district council. Mr. P. W. Sheehan, clerk.

SHEFFIELD.—August 28th.—For reinstatement after fire, at the technical school of art, for the Education Committee.—City Architect, Town Hall.

Engineering: Iron and Steel.

LONDON.—August 29th.—For the supply of one 5-ton steam tractor and three 6-ton trailers, for the Metropolitan Asylums Board.—Mr. T. Cooper, acting engineer-in-chief, Thames Embankment, London, E.C.

DUBLIN.—August 29th.—For the supply of single-phase and three-phase meters, for the Electricity Supply Committee.—City Electrical Engineer, Fleet-street, Dublin.

MANCHESTER.—August 30th.—For the erection of a refuse destructor furnace, for the Board of Guardians.—Mr. J. Macdonald, clerk, Union Offices, All Saints, Manchester.

BRADFORD.—September 5th.—For the supply of one Willans' two-crank compound engine, direct coupled to Phœnix multipolar generator, having an output of 300 kilowatts at 500 to 550 volts, and 260 cells for storage battery, made by the Hart Accumulator Company, for the corporation.—City Electrical Engineer and Manager, Town Hall.

Roads.

SCUNTHORPE.—August 30th.—For the supply of any quantity up to 400 tons of broken granite of approved quality, for the urban district council.—Mr. Herbert Heap, engineer and surveyor, 110 High-street, Scunthorpe.

HASLEMERE.—August 31st.—For the supply of about 800 tons (more or less) of 2-in. and 1½-in. broken granite, for the urban district council.—Mr. Howard V. Snook, surveyor, Council Offices, Haslemere.

LOFTUS.—September 2nd.—For the supply of broken whinstone and slag, for the urban district council. Mr. Bernard J Wormleighton surveyor, Town Hall, Loftus, Yorks.

BEDFORD.—September 4th.—For the supply of 1,750 tons of broken granite, 4,740 tons of ironstone slag, and 1,600 tons of ironstone slag tar-macadam, for the corporation.—Mr. N. Greenshields, borough engineer and surveyor, Town Hall.

Sanitary.

HARTISMERE.—August 31st.—For the construction of a sewer drain, for the rural district council.—Mr. H. Warnes, clerk, Council Offices, Victoria-road, Eye.

HASLEMERE.—September 1st.—For the supply of about 380 yds. of hard crushed and uncrushed clinker for use as filtering media in percolating filters, for the urban district council.—Mr. H. V. Snook, surveyor, Council Offices, Haslemere, Surrey.

EPSOM.—September 5th.—For the supply of horses and men in connection with the work of emptying cesspools, for the rural district council.—Mr. W. T. Wooldridge, surveyor, Waterloo-road, Epsom.

EPSOM.—September 5th.—For the removal of house refuse, for the rural district council.—Mr. W. T. Wooldridge, surveyor, Waterloo-road, Epsom.

ROWLEY REGIS.—September 5th.—For relaying and reconstructing sewers, for the urban district council.—Mr. W. Wright, clerk, Council House, Old Hill, Staffs.

BRIGHTON.—September 6th.—For the supply of glazed drain-pipes, for the corporation.—Borough Surveyor, Town Hall.

MOTTRAM-IN-LONGDENDALE.—September 9th.—For cleansing closets and ashpits, for the urban district council.—Mr. S. Hudson, inspector.

Stores.

BRADFORD.—August 28th.—For the supply of materials for the Gas Committee.—Mr C. Wood, gas engineer, Town Hall.

The Surveyor

And Municipal and County Engineer.

Vol. L. SEPTEMBER 1, 1916. No. 1,285.

Minutes of Proceedings.

Sanitary Problems near Camps.

There must be many surveyors in different parts of the country in whose districts military camps have been established who will be interested in Mr. G. Hartfree's paper on "Sanitary Problems in Civil Areas near Temporary Military Camps," which appears in this issue. While the military authorities can generally be relied on to see to the sanitation of the camp proper, their jurisdiction and solicitude does not extend beyond the confines of the camp. On the outskirts of the camp there are, however, other sanitary problems to be dealt with by the civil authorities, caused by the influx of visitors or relatives of the men in the camp, or by those enterprising persons who cater for the wants of the soldiers, ranging from the pedlar to the multi-millionaire provision dealer. One of the first difficulties to be encountered is that of housing these visitors in a sanitary and satisfactory manner. The houses in the neighbourhood are rarely sufficient to accommodate the new-comers, and a certain amount of overcrowding is generally unavoidable. As the demand is bound to be of a temporary, and in some cases only of a seasonal, character, it is necessary to supplement the existing accommodation by erecting a number of temporary buildings of wood, corrugated iron, or even canvas. Under the circumstances the local authority are unable to enforce the building by-laws, and the only thing to be done is to see that these temporary buildings are made as sanitary and comfortable as the unusual conditions will permit.

The simple methods of dealing with the refuse and waste of a few isolated country houses or a group of cottages, which are effective enough under normal conditions, are in the neighbourhood of camps found inadequate, and in many cases a system of refuse collection and sewage disposal of a much more effective and costly description has to be carried out. The temporary character of most of the camps makes it impossible to adopt the sanitary measures which would be desirable if the conditions were permanent, but as the necessity for the work will disappear with the end of the war, it is in the interests of the ratepayers that the sanitary provisions, while being effective, should be of a simple and inexpensive character. The difficulties with regard to water supply and the disposal of the solid and liquid wastes of the district are under such circumstances very great. There are probably not many villages where there is no public water supply, even if it is only obtained from the parish pump, but there are very many where no system of refuse collection or sewage disposal is to be found. Where a public supply of water is laid on to the houses there is often no sewerage system beyond the cesspools taking the drainage of a single house or a group of cottages. If the water supply is obtained from a well on the premises the danger of pollution from the use of cesspools is very great. Mr. Hartfree in his paper gives some useful details for the construction of wells, cesspools, and bacterial tanks in such a way as to avoid trouble from pollution. He is of opinion that the solution of the problem with regard to the temporary conditions prevailing near our camps is in strictly local action by our sanitary authorities, who should enforce the provision of sanitary requirements so far as the special conditions allow, and by the establishment of an educational assistance department, which would supply constructive and geological details with regard to water supply and the disposal of the refuse and wastes of the district. As Mr. Hartfree says in his paper, "insanitary conditions arise from ignorance or indifference," and education on sanitary matters is badly needed. It is, however, a somewhat tall order for the surveyor to be called on to supply this education to all and sundry who like to squat in his district, and it also adds greatly to his responsibility. A little knowledge is dangerous, and a course of lectures or a few pamphlets on sanitary matters, which is practically all that the surveyor could hope to offer in the way of education, is hardly likely to be very effective under such conditions, though they would doubtless prevent the more glaring mistakes which are now frequently made in rural districts.

* * *

Private Bill Legislation and Common-law Rights.

The recent case of *Place* v. *Rawtenstall Corporation* is an interesting illustration of the principle that an enactment limiting or abrogating a common law right will be construed strictly against the person or body who seeks to take advantage of it, and in favour of the party whose right is so limited or abrogated. The enactment in question in this instance was sec. 257 of the Rawtenstall Corporation Act, 1907, which provides as follows: "Whenever the corporation or the surveyor, under this Act, or any local or general Act or by-law for the time being in force within the borough, execute, re-execute or alter any work, or do any act or thing in default or at the request of the owner, occupier or other person required to do such act, work, or thing, the corporation shall not, as between themselves and such owner, occupier or other person, in the absence of negligence on the part of the

corporation, or the surveyor, or of any contractor or other person employed by them or him, be liable to pay any damages, costs, charges or expenses for or in respect of or consequent upon the executing . . . of such work . . . and any such damages . . . paid by the corporation . . . shall be part of the expenses payable by such owner, occupier or other person, and shall be recoverable accordingly." This, it will be seen, is pretty sweeping.

The facts of the case were briefly as follows: The plaintiff having made default in complying with a notice from the corporation to convert his pail-closet into a water-closet, and connect it with a sewer, the corporation did the work themselves. Unfortunately, however, for themselves, they did not confine their operations to that work, but did considerably more—that is to say they constructed a sewer to carry away the sewage not only from the plaintiff's house, but also from several other buildings, at a total cost of £54, of which the plaintiff's share was £11. It appears, however, that as a result of the work the plaintiff's house had been damaged by subsidence, and, on this ground, he not only refused payment, but claimed compensation. The matter was referred to an arbitrator, who awarded the plaintiff £46 and costs, and this action was brought to recover the amount so awarded. The corporation pleaded the above section of their special Act, but Mr. Justice Ridley, at the Manchester Assizes, gave judgment for the plaintiff, and his decision has been affirmed by the Court of Appeal on the principle above stated. In applying that principle to the facts of the case, Mr. Justice Scrutton pointed out that, inasmuch as the pipe which had been laid along the plaintiff's passage was sufficient to conduct the sewage or rain-water of eight or nine houses, it was not work in respect of which the plaintiff was "in default," and the damage did not result from the plaintiff's failure to perform "such work." "It was correct, no doubt," said his lordship, "to say that it 'included' the work which the plaintiff should have done, but it included much more, and there was no finding that the damage was caused only by the work which the plaintiff had received notice to do." The principle of construction thus followed appears to us to be a very salutary one. Parliament, of course, is omnipotent (in the region of legislation), and can, either by a public or a private Act, curtail, or even altogether abolish, common-law rights; but it is in the public interest that enactments of this kind (especially where they are contained in a private Act) should be regarded somewhat jealously, and that where (as in this case) such a clause is relied on as a defence to a claim founded on a common-law right the defendants should be bound (in order to succeed) to bring themselves within the strictest letter of the clause. This the Rawtenstall Corporation failed to do.

* * *

Sanitary Administration and the War.

Taking as his subject the catch-phrase "Keep the home fires burning," Mr. J. Siddalls, the chairman of the Devon and Cornwall branch of the Sanitary Inspectors' Association, read an interesting paper at a recent district meeting of that body, in which he discussed the question of how the sanitary inspector can best aid in keeping the home of the soldier on active service bright, cheerful, and protected for him against the time of his return. In an apt phrase he described sanitary inspectors as "the executive of the forces arrayed against sickness, disease, and death," and he emphasised the fact that in fighting these enemies of the social organism they are performing a national service in a double sense, for not only are they improving the general conditions under which the working and poorer classes live, but they are also working to make a happier welcome for our heroes when they return from the fighting-line. In speaking of the urgent need for municipal economy, he urged once more that zeal should be tempered by a wise discretion, and in the same connection he pointed out that in many towns a considerable saving can be effected by a more scientific use of waste products. True, it is probably only in the larger towns that the collection and sale of scrap iron, bottles, and tins can be made to pay, but even in small districts the separate collection of waste paper may be good business in these days of high prices. Thus, in Mr. Siddalls' own district the separate collection of waste paper has been carried out for some four years past. It will thus be seen that it was not introduced as a measure of war economy, and the original saving was confined to a reduced cost of haulage to a tip which is about 1½ miles distant. Since the war, however, prices have risen to such an extent that the past six months' working have produced a revenue 25 per cent in excess of the whole cost of collection in addition to the saving on haulage. Mr. Siddalls also referred to the effect of the war on the house-to-house inspection under the housing regulations of the Housing and Town Planning Act, 1909. It will be remembered that the Local Government Board have suggested by circular that, while not unduly relaxing the standard of public health administration, local authorities should, as far as possible, refrain from requiring the execution of work the cost of which has to be borne by private individuals, unless the work is urgently necessary for the removal of nuisances or the protection of health. There is some danger in certain quarters that this circular may be used as an excuse for lax administration, and that in consequence returning soldiers may find awaiting them unattractive and insanitary homes. It is worth emphasising therefore that it is the duty of local sanitary authorities at once to deal with and remedy all cases where any insufficient or insanitary drainage, want of proper closet accommodation, improper water supply, or overcrowding is found to exist. Mr. Siddalls is to be congratulated on having enabled his hearers to look at an old subject from a new point of view.

* * *

Housing in Edinburgh.

Writing in the current issue of the *Journal of State Medicine*, Sir William Brown, ex-Lord Provost of Edinburgh, describes the housing policy which has been pursued by the corporation of that city, and points out the special difficulty that has been experienced in dealing with the problem as it affects the very poor—and also the profligate and vicious class. Three large schemes have been carried out in Edinburgh under Part I. of the Housing of the Working Classes Act, 1890. Before these were undertaken the conditions under which the poorer citizens of the "Queen of Cities" were compelled to live were notoriously bad, but here, as in other places, a forward housing policy has been reflected in a considerably reduced death-rate. The first of the schemes referred to was promoted in 1893, and comprised ten unhealthy areas in various parts of the city. This was followed in 1898 by a second scheme for two areas at Stockbridge and Portobello respectively, while in 1900 a further scheme was initiated which included the notorious Greenside area. After these operations were completed, a most noticeable improvement resulted, which (in the words of Sir William Brown) affected not only the sanitary conditions, but also the *class* and conduct of the inhabitants in the areas concerned. The change in class was not due to any lack of effort on the part of the authorities to rehouse those actually displaced by the various clearances. On the contrary, in all cases these persons have

received a preference as tenants of the new dwellings. In the vast majority of cases, however, the offer has been refused, and accommodation has been sought elsewhere. An example is afforded by the case of Greenside, where a list of tenants to be evicted was carefully examined, each tenant was visited and a house offered at Portsburgh. Only two tenants came to see the new houses, and these they declined on the ground that there was *too much light!* The class which loves the darkness rather than the light obviously cannot be catered for directly in any municipal housing scheme, and must principally be dealt with by means of closing orders. Nevertheless, the larger policy is amply justified by its beneficent effect on the death-rate. In Edinburgh this has fallen during the last forty years from 27·8 to 14·3 per 1,000, and he would be a bold man who would deny that improvement in housing conditions has been one of the main factors in bringing about this reduction. It must be remembered too that these figures relate to the city as a whole. In the actual areas dealt with the results are far more striking, examples being a reduction from 36 to 17·1 per 1,000 in the Lawnmarket district and from 53 to 24 per 1,000 at Tron Square and High School Yards.

* * *

Security of Tenure in Ireland.

Security of tenure for the municipal engineer may not be within the range of practical politics so far as Great Britain is concerned, but, as was mentioned by Mr. J. H. Drew in his Blackpool paper recently, a form of security has been in existence in Ireland for some years past. As may be supposed, this protection is not bestowed upon the official gratuitously, for it carries with it the statutory right of the Local Government Board for Ireland to insist upon a standard of eligibility for architects, engineers, or surveyors engaged by local authorities. How the rule works in so far as its security aspect is concerned is illustrated in the proceedings recently of the Waterford County Council. A proposal was to be submitted for the increase of the salaries of the assistant county surveyors, and the chairman, Mr. Thomas Power, in the course of an explanatory speech, said: "There is another point. That is that even if you fail to come to an agreement with the assistants with regard to their request for increases of salaries, they can appeal to the Local Government Board independent of you. This was done once before in the instance of the late county surveyor. He applied for an increase here which was refused. Then he applied to the Local Government Board for redress, and they sent down an inspector. The inspector recommended the increase he sought for, and he got it. The assistants now would much prefer this matter to be settled by you than that they should seek for redress anywhere." It is noteworthy that the assistant county surveyors were voted increases of salary by the county council after an exceptionally business-like debate, in the course of which not a single councillor resorted either to personalities or to passionate protestations on behalf of the interests of the poor ratepayer. Whether this happy result was due to the knowledge that the officials were not entirely at their mercy we need not stop to inquire, but it seems undeniable that, thanks to the status conferred by the law in Ireland, the municipal and county surveyors occupy a favoured position compared with their brethren in Great Britain.

* * *

Sludge Disposal.

The progress which has been made towards the solution of the sludge problem by means of the activated sludge process of sewage treatment has caused many to entertain great expectations, which may be fulfilled to a large extent in due course. Meanwhile, and for many years to come, there will be a large number of works where other methods will have to be adopted. So far as can be gathered from various sources the digestion of sludge after separation from the sewage has been found to work successfully. At Birmingham this was done by pumping out the sludge from the preliminary settling tanks into comparatively shallow digesting tanks, and so far as we are aware this system is still in operation there with satisfactory results. Other systems in which the sludge is allowed to digest separately are the Travis hydrolytic tank and the Imhoff tank. In the Travis tank only a small portion of the sewage flows through the digestion chamber, while in the Imhoff tank the sewage is entirely separated from the sludge. A considerable number of Imhoff tanks have been in operation for some time, especially in the United States, with good results, but it appears from an article in *Engineering Record*, which is printed on another page, that attempts are being made to overcome certain difficulties which have arisen in connection with these tanks by removing the partly digested sludge at frequent intervals and subjecting it to further digestion in a separate tank.

The details given in the article are very interesting, and are worthy of careful study. Unfortunately the method recommended involves pumping — a troublesome matter when dealing with sludge, and necessitating an increase in the cost of maintenance which every sewage works engineer does his utmost to avoid. One of the great advantages of the Imhoff method of sewage treatment is that the sewage is kept as fresh as possible, and is not fouled by the products of the anaërobic decomposition of the sludge, so that its subsequent treatment on filters or otherwise is carried out with the least possible risk of creating a nuisance. Where sufficient fall is available the separation and separate digestion of the sludge can be arranged without pumping, but there are so few cases where this is possible that the question of its adoption will involve careful consideration of the increase in the cost of maintenance due to the necessity of pumping the sludge.

* * *

Corrosion Research.

As a result of the recognition some six years ago of the need for a thorough scientific investigation into the question of the corrosion of condenser tubes, a Corrosion Research Committee was set up by the Institute of Metals. Research has up to the present been conducted at Liverpool University, and three valuable reports have been issued. An extension of the operations of the committee has recently been rendered possible owing to the receipt of a substantial grant in aid from the Government, and by an excellent arrangement it has been decided that the committee should in future conduct its operations in the Southwick power station of the Brighton Corporation. The advantage of the new venue arises from the fact that the Southwick power station is on the coast, and thus affords facilities for the use of sea water by the committee's plant. Indeed, it may be said that in future there will be a State-aided corrosion research station working under almost ideal conditions as regards supplies of water and power and atmosphere. The offer of the corporation was made at the instigation of Mr. John Christie, M.I.E.E., to whom great credit is due, and their action in thus associating themselves with this work should set an example to municipal and other bodies of the possibility of assisting in that co-ordination of scientific and industrial research that it is one of the main functions of the Government Research Council to effect.

Road Board Laboratory Tests.

By H. P. MAYBURY, M.INST.C.E., COLONEL R. E. CROMPTON, R.E., and DR. T. E. STANTON.

[The following report on tests carried out in the road testing machine at the Road Board Laboratory, Teddington, appears in the form of an appendix to the Board's fifth annual report, a brief notice of which was given in our issue of last week.]

The testing of road materials under the instructions of the board was begun in the course of the year 1911. In addition to laying down many kinds of surface materials on test lengths of a road at Sidcup and elsewhere, laboratory apparatus for testing the qualities of road-stone was ordered from the United States and installed in the board's department of the National Physical Laboratory at Teddington.

Later in the year it was seen that this laboratory plant might be advantageously supplemented by a form of testing machine in which road material could be laid down as if it were a part of an actual roadway, and subjected to the rolling, hammering, and abrasive action of loaded wheels driven over it at speed. This appears to be a mode of testing which in some respect affords a more accurate means of comparison of certain qualities of these materials than is possible when the material to be tested is laid in the open, exposed to the varying conditions of moisture and varying temperature of our climate, and to irregularity of traffic, for these varying conditions render accurate comparisons difficult, so that the comparisons which can be made between the materials tested are necessarily uncertain and largely a matter of individual opinion.

The design for the road machine was prepared, and after delays caused by the novelty of the problem, it was set to work on preliminary tests during the summer of 1913.

The results of the more recent tests afford valuable information to which the attention of road authorities, engineers and surveyors may be called. In addition to showing that these bituminous surfaces when carefully made and laid are likely to be durable and economical, the tests appear to throw light on several of the causes of past failures, and indicate means by which such failures may be avoided or minimised in future.

THE ROAD TESTING MACHINE.

The road testing machine consists of a revolving frame supported on wheels running on a test path. The circular test path is 34 ft. diameter, and has a working width of 2 ft. The road material is laid down on a concrete foundation. On the surface to be tested the machine revolves at any desired speed, but when steel tyres are used, as has hitherto always been the case, this must not exceed 7 miles an hour.

The road machine framework is supported by eight wheels, each 3 ft. 3 in. diameter by 3 in. tyre width. Each of these eight wheels is driven by its own electric motor, so that the action on the test surfaces is nearly the same as that of a driving wheel of a motor lorry loaded to the same weight. In most cases the weight per inch of tyre width has been about 470 lb., but during the consolidation stage this has been sometimes increased to 750 lb., which is approximately the maximum allowed by the Local Government Board regulations.

The test surface may be kept either perfectly dry or it may be sprayed to any desired degree of wetness, and as wetted surfaces can be tested to destruction sooner than when the track is kept dry, the wet test has now become the standard of comparison. During a wet test the whole of the material worn off by attrition can be collected and weighed, and thus the loss of material from actual wear can be accurately measured. The temperature of the test room may be maintained at any desired point between that of the summer and winter seasons, and as bituminous materials soften and show the least resistance to deformation during the summer months, a temperature approaching that of summer has generally been maintained.

HOW TESTS ARE CARRIED OUT.

The tests are now carried out in the following manner: A manufacturer of road material, or a road authority desiring to have his material tested, sends about 3 tons of it ready mixed, in a motor wagon, so covered and protected from loss of heat that it can be delivered at a sufficiently high temperature, which is usually from 300 deg. to 330 deg. Fahr., to be soft and plastic enough to be properly laid and finished. The hot material is filled into the track, then levelled by raking to the depth required to consolidate it to a finished carpet 1½ in. thick; the consolidation is then carried out by rolling it with the machine, or by hand rolling, or by tamping, as makers prefer.

At the time the track is laid test samples are made in separate moulds and preserved for reference. The machine is then started and run on the new surface with a gradually increasing load until about 4,000 to 6,000 tons per yard of width have rolled over it—this is called the consolidation period.

The test proper then commences—the machine is run at a load of 470 lb. per inch of width at a rate of about 2,200 tons per yard of width per hour; the running hours are about eight per day, the track being kept wet all the time. The condition of the track is observed twice a day or oftener, and any defects which may appear are entered on the test sheets. The material worn off by attrition is collected as mud, dried and weighed. In most cases with good material a well-laid surface remains smooth and polished and but slightly marked until about 200,000 tons per yard of width have rolled over the track. Generally about this stage wave-like markings begin to appear. These gradually extend themselves until at 400,000 tons the surface becomes considerably waved, so that the vibration caused and communicated to the machine and building is excessive, and the test is then considered complete. Plaster casts are then taken to record the shape and the condition of the road surface—usually one of these is taken at the worst point where the surface is most waved, and another at the point where it is smoothest. Test pieces are cut out and their density compared with the first set of samples, so that the increase of density during the test can be recorded.

FOUR SETS OF TESTS.

The four sets of tests now published—three of these showing good results and one a failure due to well understood causes—show that upwards of 400,000 tons per yard of width can be obtained in this machine, and as makers gain experience by watching the behaviour and relative deformation of their material during the various stages of consolidation and subsequent deformation, it appears quite reasonable to expect that further progress will be made.

The above results should be considered as laboratory tests purposely made as destructive as possible so as to be of value for comparison of wear-resisting properties. Some of the materials have been in practical use for a considerable time, and have already carried under ordinary traffic conditions a weight of traffic in excess of that shown in these tests. The laboratory figures must always be regarded as relative and not as indicating the weight of traffic which the materials will carry when laid on the road.

The principal figures of the four tests are shown arranged in four vertical columns in Table I., so that the nature and quantity of the materials used and the rolling load carried in tons per yard of width being arranged side by side, can be readily compared. It will be seen that, as was expected, as the test goes on, the density of the material measured by its specific gravity gradually increases; this, of course, is not regular throughout the thickness of the material, but is generally greatest at its upper surface.

As would be expected, tests for water absorption which are carried out by cutting samples from the track at the end of the test and soaking them in water for a period of three months, noting their increase in weight at the end of the soaking period, show that the water absorbed is to some extent in proportion to the percentage of voids in the material indicated by the difference between the specific gravity of the consolidated material and its specific gravity calculated as if it were absolutely free from voids.

Additional tests, such as resistance to impact, have not yet been carried out sufficiently fast to enable them to be valuable as indications of over-hardness

ROAD BOARD LABORATORY TESTS: TABLE I.

* Not including test after patching.

† This test is still proceeding.

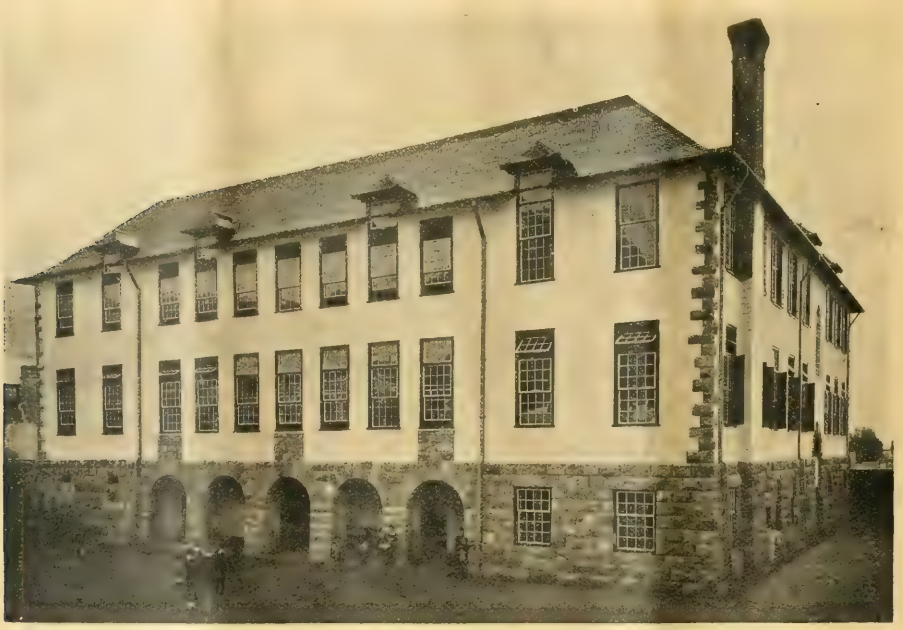
or brittleness, but as far as they have gone they seem likely to have considerable value.

During the course of the tests longitudinal and transverse sections were taken of the surface of the road. A special apparatus was constructed to do this by which the amount of the vertical displacement was doubled; the formation of hollows was therefore easily detected. The amounts of the deformation given in Table I. were obtained from the sections with the aid of a planimeter.

We have confined the particulars set forth in this report to the tests commencing with test road No. 9. The previous tests carried out were experimental, being mainly intended to determine the best working conditions for the testing machine, and we understand that you have decided that it would be unfair to publish the details of these preliminary tests in comparison with test No. 9 and subsequent tests, the results of which can be relied on as accurate.

SCHOOL BUILDING IN SOUTH AFRICA.

The accompanying photographic view illustrates an interesting type of school building which has been erected by the education authorities of Cape Town at a cost of £14,500. Accommodation is provided for 600 children.



New School in Cape Town.

All the conditions called for a compact plan, and thus the building evolved inself into the following form: The classrooms are grouped round a central courtyard, and are carried up two floors. Two entrances are provided, each giving on to a staircase which communicates with both floors. The fall of the ground has been adapted in such a way that on the lower ground level are found cloak-rooms for boys and girls, separate covered playgrounds for both sexes, woodwork room, two large kindergarten rooms, cookery rooms, four classrooms, in addition to a snug room for the principal and one for the women teachers. The first floor contains nine classrooms, together with a library and a room for men teachers.

The architects are Messrs. Herbert Baker and Kendall, and the contractor is Mr. J. L. Drake, of Cape Town.

The Kahn system of reinforced concrete was used in the construction of the building.

PUBLIC WORKS LOAN BOARD.

ANNUAL REPORT.

In their report for the year 1915-16 the Public Works Loan Board state that in accordance with the arrangements made with the Treasury they have granted loans only where it could be shown that their purpose was (*a*) urgently necessary in the national interest for the furtherance of the war, or (*b*) of urgent necessity for reasons of public health.

The board have thus continued their policy of assisting in curtailing capital expenditure and fresh borrowings by local authorities and others, in view of the necessity of preserving the capital resources of the country in the national interest. Sanction has only been given to loans which satisfied the above-stated conditions, and the effect of these restrictions has been very materially to reduce the amount advanced by the board during the year.

Of the new loans granted during the year, and amounting to £1,152,716 (as compared with £4,973,855 during the previous year), no less than £554,328 represents loans under the Housing of the Working Classes Acts for providing dwellings for munition workers in various centres, leaving only £598,388 as the whole of the other loans, £16,532 of which sum was granted to county associations under the Territorial and Reserve Forces Act, 1907, the bulk of the remaining £581,856 representing unavoidable expenditure incurred in respect of contracts entered into before the war, only a small proportion being due to expenditure of urgent necessity for reasons of public health.

The advances actually made by the board during the year numbered 842, the whole amounting to £1,864,224, as compared with 1,982 advances for sums amounting to £4,698,602 in 1914-15. Of the total for the past year, £1,864,224 was advanced on security of local rates, and the remainder on the security of property.

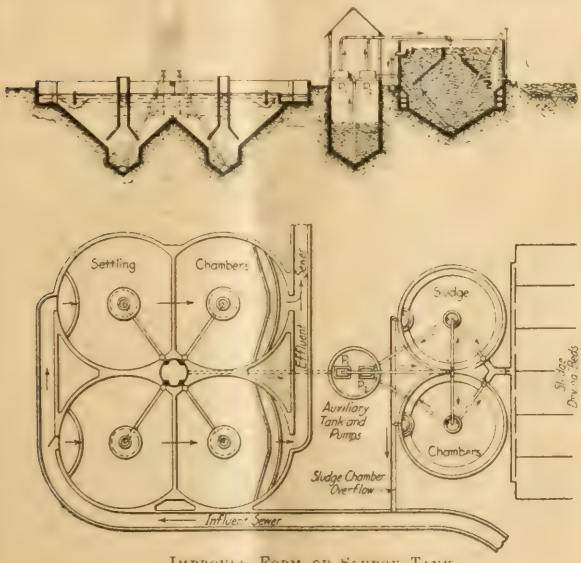
Pudlo.—The filtration of water through leaky railway bridges has engaged the attention of railway engineers for many years. We are informed that the North-Eastern Railway have been experimenting with renderings of Pudloed cement upon two of their railway bridges at Bridlington and Whitby respectively, and that the engineer has expressed his satisfaction with the result.

Separate Sludge Digestion and Improved Mixing in Imhoff Tank.*

By DR. IMHOFF.

The most modern and the most widely used methods of sewage treatment show an unmistakable tendency to keep the sewage as fresh as possible, to remove the settled sludge from the settling chamber as rapidly as possible, and to cause this sludge subsequently to undergo a process of anaerobic decomposition in a separate chamber. Imhoff tanks are included in this category. The characteristic of an Imhoff tank is that it is composed of a sludge chamber situated under a settling chamber and so connected with the settling chamber by means of a slot as to permit the settling sludge to slide by gravity from the latter into the former, but so as to prevent any flow of sewage through the sludge chamber.

Objection has sometimes been made to Imhoff tanks on the ground that they necessitate two-storied construction, with its attendant difficulties and expense; and attempts have frequently been made to secure the advantages of Imhoff tanks by placing a sedimentation chamber and a sludge-digestion chamber side by side and then pumping the sludge from the former to the latter as a substitute for the gravity flow in Imhoff tanks. However, many difficulties have developed in the course of these attempts, and it is only recently that these difficulties have been obviated.



IMPROVED FORM OF SLUDGE TANK.

SEPARATE SLUDGE DIGESTION.

In the following discussion, apparatus will be described in which the settling chamber and the sludge-digestion chamber are situated side by side and in which it has been found possible both to keep the sewage fresh and to digest the sludge satisfactorily. All apparatus herein described has been constructed and operated on a practical basis in large municipal sewage plants.

The difficulties which have developed in connection with separate sludge digestion are twofold. They relate to the settling chamber and also to the sludge chamber. The problem in connection with the settling chamber is to remove the sludge from it so frequently and so completely as to insure the maintenance of the sewage in a fresh condition. The older type of plant, in which it is necessary to pump out the total water content of the tank each time sludge is removed, will not be discussed here, as this type of plant is not practical. There is only one other form of plant, and in this form the sludge is removed from the tank without discharging the supernatant liquid. The invert of the sedimentation chamber in designs of this kind must be divided into one or more sumps and a sludge-discharge pipe inserted for each sump so that its lower end reaches to the lowest end of the sump. In the operation of plants of this kind it has developed that the sludge cannot all be removed, but that a considerable portion always remains sticking to the walls. In addition, the inevitable funnelling of the sludge in the sump and the consequent discharge of water with the sludge unnecessarily increase the water content of the latter. The residue of sludge which remains in the sedimentation chamber decomposes, gasifies, floats to the surface, and may thus escape with the effluent.

In the accompanying drawing these difficulties have been avoided by the addition of a hood above each sludge sump. The presence of this hood makes it unnecessary to remove all of the sludge at each operation. Even if the remaining sludge should become septic and float it would be confined to the hood and not endanger the effluent. In effect, it would rise to the surface inside the hood, sooner or later give up its gases, and finally sink again, to be removed with the next sludge discharge. Inasmuch as the sludge is never completely removed, it is impossible for water to break through and escape with the discharging sludge.

In addition to this device, which makes it possible to obtain sludge of relatively low moisture content and simultaneously to keep the sewage fresh, there are also a number of other new features included in the drawing. The tank is cylindrical and its invert is conical. Such a design permits the same slope at all points of the invert and causes the sludge to slide uniformly toward the lowest point. Statically, also, this form of tank is the best. It makes possible the use of thinner reinforced-concrete walls than any other design, since it is exactly adapted to receive the stresses produced by the upward pressure of ground water and by the radial pressure of the liquid contents.

FLOW HORIZONTAL.

The direction of sewage flow in the tank is horizontal and not downward and upward, as has hitherto been usual with circular tanks. The downward and upward direction of flow has been found to be inferior from the standpoint of percentage removal of settleable solids. Nor does the sewage flow from centre to circumference as in the past. It flows from one side of the tank to the other, so as to produce a longer flow line and at the same time to eliminate a considerable portion of the excessively long circumferential effluent channel. This form of tank therefore approaches most nearly an ideal design from the three standpoints of statics, sewage sedimentation and sludge removal. The drawing shows two tanks combined as one.

The decomposition of sewage sludge in separate chambers was first believed possible in shallow, flat-bottomed tanks. It was thought that it would simply be necessary to pump the sludge into these tanks and allow it to remain until sufficiently decomposed. All attempts of this kind have, so far as I am aware, failed. The sludge in these tanks produces unpleasant odours, and takes a long time to decompose to anything like a condition in which it can be dried without nuisance.

A properly designed sludge-digestion plant should be one in which the sludge takes only a few months to decompose to a condition in which it dries easily and without producing a nuisance. Neither should

*From *Engineering Record.*

any foul odours be produced in such a plant during the process of decomposition. These requirements have been satisfied in Imhoff tanks, and it seems logical, therefore, to imitate artificially in the separate digestion process the conditions obtaining in an Imhoff tank. The design shown in the drawing is the result of a successful attempt to imitate these conditions.

PROMOTE GROWTH OF ORGANISMS.

In order to achieve odourless decomposition it is necessary to promote the growth of the proper organisms and to maintain the conditions necessary for their existence. With this in mind it seems logical to *feed* the sludge that is properly decomposing, and to *inoculate* the fresh sludge with the proper organisms as soon as it arrives. This inoculation is necessary so that the fresh sludge may not have an opportunity of entering into improper decomposition—for example, acid decomposition. Both of these conditions may be fulfilled by the same device. In short, it is merely necessary to *mix* the fresh and decomposed sludge in accordance with certain rules. Such mixing may be most simply done in closed pipes.

In the drawing it will be seen that the fresh sludge flows by gravity from the settling chamber to an auxiliary sludge chamber. This chamber is provided with a pump P_1. It will be observed also that a pipe leads from the bottom of the sludge-digestion tank to a second pump P_2, also located above the auxiliary chamber. In operation the two pumps simultaneously force both fresh and decomposed sludge into a common sludge pipe. This manner of operation results in immediate mixture of fresh and decomposed sludge in any desired proportion, and in the discharge of this mixture into the digestion chamber. Further mixing occurs in the digestion chamber itself by means of the rising gas bubbles. The small gas bubbles which develop as a result of the decomposition process remain sticking in part to the sludge particles, and by increasing in size progressively reduce the mass specific gravity of the combined sludge particle and gas bubble until it is less than that of water. At this time, of course, the two rise to the surface of the tank.

If the action taking place on the inside of the digestion chamber could be observed it would be seen that large and small particles of sludge are continuously rising to the surface of the tank, there giving up their gas bubbles, and, once more heavier than water, sinking back to the sludge layer at the bottom of the tank. This natural mixing, however, is insufficient. If it alone be depended upon it will be found that in a short time a scum layer will develop and will grow thicker and thicker. When, after this begins to take place, gas-laden sludge particles rise as described, they are not able to release themselves from their gas bubbles because of this impenetrable mat on the surface, but instead become imprisoned in it. Little motion or mixing takes place in this scum layer, and for this reason it will be found that the decomposition taking place in the scum layer will be relatively feeble—may, indeed, be an undesirable or nuisance-producing kind of decomposition. This evil may be artificially avoided by constructing in the digestion chamber a partition or apron which operates in a similar manner to the partition walls in Imhoff tanks. With this apron in place the gas bubbles are deflected to a definite point or points in the tank surface. In the drawing this point is shown as the middle of the tank. In consequence of this provision there will be no rising gas bubbles at any other part of the tank surface, and any floating sludge there, not being continually buoyed up afresh by rising gas bubbles, will gradually become heavier than water and sink to the bottom. In the middle of the tank, however, to which point all of the gas bubbles are being deflected, the combined stirring action of the gas bubbles is so strong as continuously to break up the scum layer.

It seems logical also to make this part of the tank surface the part at which the fresh sludge is introduced, because at this point exists the best opportunity for the fresh sludge to become mixed most quickly and most uniformly with the contents of the tank.

UNIFORM TEMPERATURE DESIRABLE.

Since the decomposition of the sludge depends upon living organisms, it is necessary to maintain the temperature as uniform as possible. In Imhoff tanks this occurs naturally by virtue of the depth of the tank and because of the fact that the sewage which flows through the settling chamber above the sludge chamber is fairly uniformly warm. Separate sludge digestion chambers built above ground may develop difficulties, because it may not be possible without artificial aid to prevent harmful fluctuations of temperature. Artificial means may therefore in this case be of advantage. In the drawing are shown circumferential conduits on the inside of the tank. These may be operated either with warm water supplied from a central heating plant or simply with sewage.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Was it not rather startling to read lately that a Dover councillor said he had a chemical that would kill a rat at 20 yds.? Was it surprising that the council at once appointed this gentleman municipal rat-catcher, and is it not very disappointing to read that he declined the honour? Should not the rats of Dover wag their tails with joy to feel that such a dangerous "Pied Piper of Hamelin" has not taken office?

* * * *

Has the evolution of the slum been caused by devolution, as recently claimed by Mr. Cheverton Brown, of Hull, the president of the National Federation of Property Owners? Is it a fact, as stated by him, that "all slum property, when new, was decent property," and that it became bad through occupation by the "slummer"? Is there not something to be said in favour of his suggestion that such idle, filthy and verminous people are a danger to the State, and should be dealt with accordingly, instead of proceeding against the landlord, who is really not responsible? Would it not meet Mr. Brown's objections if municipal authorities would only provide housing accommodation for the real slummer and leave private enterprise to find it for the more respectable citizens?

* * * *

Why should we not produce all our power near the coalpits, and distribute it electrically, as proposed by Mr. Ferranti in his presidential address to the Institution of Electrical Engineers? Is not such a scheme too enormous for private enterprise, and can the Government take it up at present with all their other "activities"?

* * * *

Was not the paper on the security of tenure and defence of surveyors which was presented by Mr. J. H. Drew at the annual meeting of the Institution of Municipal and County Engineers an admirable digest of this important question? Is it not to be hoped that the council of the institution will take up the matter afresh, and not rest satisfied till they have induced the President of the Local Government Board to promise some legislation on the subject? Is there any ground for the suggestion sometimes made that, owing to the fact that most members of the council represent the larger and more important municipalities, they do not themselves realise the position of their less fortunate brethren? Who is to be the Don Quixote who will take up the cudgels on behalf of the surveyors, who are now unquestionably in a precarious position?

* * * *

Is there not a considerable point of importance which is sometimes lost sight of in discussing questions of town planning in some of our coal-mining districts—namely, how long will the coal which is being "gotten" last, and what is to happen if mines in these localities have to be closed down? Are there not existing in Yorkshire and elsewhere districts in which there are rows of empty cottages owing to this cause? Is it not well known that in these derelict districts a house that cost at least £150 to build can now be bought for £5, because no occupiers can be found?

* * * *

Should it not be a slight warning to some of the architectural enthusiasts on town planning when it is considered that some of the most beautiful foreign cities are not quite so sanitary as they should be? Who was it who once wrote the following lines, in the style of Pope?—

> "What though the roads be wide, the buildings tall—
> Neglected, ill-kept streets will spoil it all."

Is there not something behind beauty which is of even greater importance?

WALLASEY'S NEW TOWN HALL.

The new town hall at Wallasey, which has been under construction for the past two years, was informally opened recently for inspection by the public prior to its being handed over to the Government authorities for temporary use as a hospital.

The contract for the building was let in May, 1914, and the structure would have been completed by June last but for the war. At the latter end of 1915 it was proposed to close down the building and postpone its completion until the conclusion of hostilities; but when it became known that the War Department required further hospital accommodation, the building was offered to them, rent free, and was gladly accepted by them. During the past few months the contractors have been busily engaged in carrying out such work in the building as is required by the military authorities for hospital purposes. It has been found to be easily adaptable, and makes an excellent hospital, with accommodation for about 350 beds. The completion of a large portion of the decorative plaster-

From photo by] WALLASEY TOWN HALL. *[Stewart Bale, Liverpool.*

work, marble pavings, oak panelling, doors, &c., has been omitted for the present, and will not be proceeded with until after the war.

The new building, which throughout is in the Renaissance style, has frontages to the Promenade, Brighton-street and Queen's-road, and stands on a site of over two acres midway between the Seacombe and Egremont ferries. The building is set back about 140 ft. from the Promenade, and is approached from the latter by a series of wide steps, with terraces and grass banks. On the Brighton-street frontage, where the principal entrance is placed, a square is formed which is laid out with two large grass plots with spacious footpaths and carriage-drives around. The frontage to Queen's-road has been well set back from the street, giving such ample space all round the building as few town halls enjoy. The building has frontages of 156 ft. to Brighton-street and the Promenade, and 176 ft. to Queen's-road and the south side. It has been planned with a considerable amount of spare accommodation, which will be occupied as the various departments require further space. It has also been arranged that an additional story can be added on the north, south and east fronts without in any way detracting from the appearance of the building.

The principal entrance, placed in the centre of the Brighton-street front, gives direct access to the treasurer's department to the right and leads, by means of a wide, vaulted corridor, to the principal staircase hall, from the centre of which rises the grand staircase. The borough treasurer's offices occupy half the Brighton-street frontage and the whole of the south wing of the building on the ground floor. The Education Department is placed in the centre of the river frontage, and the Medical Officer's Department along the remainder of this frontage and the greater part of the wing facing Queen's-road. The rest of the frontage towards Queen's-road is occupied by a large entrance hall and staircases, which give access to the public hall on the first floor. The staircases and entrances are so planned that the public hall may be used quite independently of the rest of the building. In connection with the public hall an additional entrance has been provided facing the square.

The large public hall occupies the whole of the frontage to the square at the first-floor level. The hall is 87 ft. long by 50 ft. wide by 36 ft. high, opening out at the gallery level to a length of 126 ft. The ceiling of the hall takes the form of an elliptical barrel vault, which is richly panelled and decorated in fibrous plaster. The walls are to be panelled in oak to the height of the window sills. Accommodation is provided for about 1,200 persons, and includes gallery, platform and orchestra. At the head of the grand staircase on the first floor a large landing gives a further means of access to the public hall through a circular reception room. To the right and left of the landing wide corridors lead to the town clerk's departments on the one hand, and the supper room, committee rooms, and Mayor's parlour on the other. These rooms, together with the public hall, form a fine suite of reception rooms admirably suited for entertainments and social functions of all kinds.

The council chamber, which faces the river and is approached from the grand staircase, occupies a central position on the river frontage. It is reached through an ante-room having vaulted ceiling and oak-panelled walls. The chamber is a fine apartment, 50 ft. long by 34 ft. wide by 24 ft. high, and capable

of seating sixty councillors. The ceiling is richly treated in panelled fibrous plaster. The walls, like those of the grand staircase and corridors, will be finished in French stuc of a warm cream colour. Oak fluted columns and pilasters and an oak panelled dado will complete the decoration.

On the second floor the borough engineer's department is placed, a number of spare offices occupying the remainder of the space. The caretaker's quarters are on the third floor, and in connection with them dining accommodation for the convenience of the staff is provided.

Under the greater portion of the building basement accommodation has been provided. Along the north side various rooms and offices in connection with the gas department are placed, including a gas lecture room, where instruction will be given in cooking by means of gas. A large number of store-rooms is provided for the various departments, and a bicycle room, reached by means of a sloping way from the back roadway. On this floor also the boiler-house and vacuum cleaning plant is placed.

The architects for the new building were Messrs. Briggs, Wolstenholme & Thornely, of Liverpool.

The general contractors were Messrs. William Moss & Sons, Limited, Loughborough, and sub-contracts were let as follows:—

Constructional steel work: Messrs. John Booth & Sons, Bolton.

Heating and ventilation: Messrs. Saunders & Taylor, Limited, Manchester.

Lifts: Messrs. Waygood & Sons, London and Liverpool.

Sanitary fittings: Messrs. Oates & Green, Limited, Halifax.

Iron escape staircases: Messrs. Hayward Bros., Limited, London.

Patent glazing: Messrs Helliwell & Company, Limited, Brighouse.

Locks and ironmongery: Mr. James Gibbons, Wolverhampton.

Safes: Messrs. Milner's Safe Company, Limited, Liverpool.

Cooking apparatus: Messrs. John Wright & Company, Liverpool.

Cast concrete: Messrs. The Shap Granite Company, Shap.

Glazing: Messrs. J. G. Nicholls, Limited, Liverpool.

Asphalting to roofs, &c.: Messrs. La Brea Asphalt Company, Limited, Birmingham.

Concrete flagging: North Wales Paving Company, Penmaenmawr.

Vacuum cleaning plant: Fanvac Company, Liverpool.

Rainwater heads: Messrs. Walter Macfarlane & Company, Limited, Glasgow.

Door springs: Messrs. D. Elliott & Company, Manchester.

Fire appliances: Messrs. George Angus & Company, Limited, Liverpool.

The whole of the work has been carried out under the supervision of Mr. G. J. A. Burrows, of Wallasey, who has acted as clerk of the works.

Replanning of Dublin.—The adjudicators in the Marquis of Aberdeen's competition—viz., Professor Patrick Geddes, of Edinburgh; Mr. C. J. McCarthy, F.R.I.A.I., city architect of Dublin; and Dr. John Nolen, of Cambridge, Mass.—have completed their examination of the designs. The prize has been awarded to the design submitted by Professor Patrick Abercrombie, of the Department of Civic Design, Liverpool, and Messrs. Sydney A. and Arthur J. Kelly, surveyors, of Liverpool. Honourable mention has been given to the designs submitted by Messrs. Ashbee and Chettle (C. R. Ashbee, F.R.I.B.A., and George H. Chettle), architects, of Chelsea, S.W.; by Messrs. J. M. L. Bogle, B.E., city engineer's office, Liverpool; Arthur W. Panton, M.A., Assoc.M.Inst.C.E., Clontarf, Dublin; H. O. Burroughs, B.A., University School of Architecture, Liverpool; and O. Newbold, certificated architect, Liverpool; by Messrs. Kaye-Parry and Ross (W. Kaye-Parry, M.A., F.R.I.B.A., M.Inst.C.E., and George Murray Ross, M.A., B.I.A., M.Inst.C.E.I.), civil engineers, architects, and estate surveyors, 48 Kildare-street, Dublin; and by Mr. Frank A. Cushing Smith, B.S., M.L.A., University Club, Urbana, Illinois. It is hoped to arrange for an exhibition of the designs in Dublin at an early date.

WORCESTERSHIRE ROADS.

By C. F. Gettings, M.Inst.C.E., County Surveyor.

[The following is extracted from Mr. Gettings' report on the main roads and county bridges for the year ended March 31st last.]

The estimate for the year was £100,735, but at a later date, in consequence of the special conditions existing at that time owing to shortage of labour and difficulties in obtaining material, the committee recommended a reduction of £14,901, which made the revised estimate for the year £85,834. This was approved by the county council in September. The greater part of this reduction was abstracted from the estimate provided for under the Road Board scheme. The total expenditure was £76,262, which left an unexpended balance of £9,572; the greater portion of the latter sum was for work included in the ordinary maintenance estimate for the various districts. Unfortunately, this was due to our being unable to obtain materials and to the serious depletion of the staff. As compared with the approved estimate (which was considered to be a reasonable one) it will be seen that the expenditure for this particular year is £24,473 less than was originally provided. The estimate for the current year was made on the basis of the actual expenditure of last year. It must be quite evident that this principle cannot be continued without serious results, especially as the heavy motor traffic continues to increase, and it is already quite perceptible on many of the roads which have been starved. Although I do not wish to enlarge unduly upon this point, I consider it my duty to call the attention of the committee to the serious position which will have to be faced in the near future.

Last year was one of the worst as regards maintenance of roads that has been experienced for many years, as the early part of the summer was very wet, so that the roads did not have a chance to recover, and, coupled with this we experienced a record snowfall, which in many cases caused the traffic to be diverted into one channel for considerable periods.

MOTOR-'BUS TRAFFIC.

The motor-'bus traffic has continued to increase, some new services being opened and a number of the services already scheduled in previous reports being extended. There are now services over 216 miles of main roads in the county, which is exclusive of roads maintained by borough or urban district councils. As I pointed out in my last annual report, the whole of these services have been put into operation since September, 1912.

The Local Government (Emergency Provisions) Act, 1916, which includes special clauses relating to the establishment of motor-'bus routes, is now under your consideration. It appears that this Act was brought about more to prevent the immediate extension of motor-'bus services than to establish a principle of contribution towards the upkeep of the roads. Unfortunately, this county has been hit very severely in this direction, and, although it is admitted that the services are a convenience to the public, it is a debatable question as to whether the benefits enjoyed are recouped by the county in an indirect manner. There is no doubt that this traffic is one of the most destructive that has ever been put on to the public highway.

TAR-PAINTING.

About 96 miles of main roads (exclusive of borough and urban areas) were tar-painted, at a cost of about £5,500. Excepting on gradients, the whole width of the roads has been treated, and some 1,004,575 super. yds. were covered. As in previous years, the work was carried out by our own staff. As the committee are aware, I am a strong advocate of tar surfacing where there is a moderate amount of motor traffic, and I am sure the work that has been carried out on the more important roads hitherto has been of material assistance where the motor-'bus services have been established, and I am glad that the committee decided further to extend this work if it could possibly be done during the current year.

URBAN MAIN ROADS.

The borough and urban authorities have maintained their roads fairly satisfactorily considering the circumstances under which we are now working, but in several cases the condition is not what might

be desired. It would not be fair to criticise at the present time, but I hope that considerable improvement will be effected immediately circumstances permit. I still consider that more attention might be given to scavenging, and less to street watering.

ROAD BOARD SCHEMES.

The five years' scheme, commenced in May, 1913, was proceeded with throughout the year, but the rate of progress made was exceedingly slow, as at no time were more than three gangs employed, and latterly only two, and those very small in number. Attention was mainly confined to the Birmingham and Halesowen road (part Mucklow's Hill), Hagley and Halesowen road, Kidderminster and Hagley road and Birmingham and Redditch road, all of which had got into an unsafe condition through the heavy motor traffic, and it was imperative that these sections should be proceeded with immediately. The total length of roads reconstructed under this scheme to March 31st last was approximately 25¼ miles.

[The scheme provides for the strengthening, widening and surfacing with bituminous-bound material of about 53½ miles of main roads, at an estimated cost of £127,000.]

STEAM ROLLING.

The twelve ordinary steam rollers and two patching rollers belonging to the council have been working throughout the year. The ordinary rollers have worked 2,394½ days, and have consolidated 56,618 tons of material, being an average of 23½ tons per day. This average is much lower than previous years, and is due to the fact that the majority of the rollers have been understaffed. The patching rollers have been fully employed and have done very useful work, but it is difficult to give an accurate estimate of the quantity consolidated.

Allowances to Officials on Service.—The question of the allowances paid by Doncaster Corporation to supplement the Army pay of corporation servants who had enlisted has been considered by the council. The council had applied to the Local Government Board for sanction to continue their allowances on the scale originally fixed, and the Local Government Board now replied that where local authorities had applied for sanction to continue allowances above the maximum laid down in the Emergency Provision Act, they would be permitted to do so with the limitation that in no case shall the allowance paid together with the Army pay and separation allowance increase an enlisted employee's income to an amount more than 25 per cent above his pre-war salary.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRY HELD.

Wantage R.D.C. (August 22nd. Mr. A. G. Drury).—£3,150 for works of sewerage and sewage disposal at Letcombe Regis and East Hendred. The engineer, Mr. J. W. Harris, gave details of the proposed scheme, and at the close of the inquiry the inspector suggested that the work to the council should endeavour to get the owners of various properties to disconnect their sewage from the stream.

APPLICATIONS FOR LOANS.

Bradford T.C. £3,700 for electric wagons.

Inishowen (Donegal) R.D.C.—£1,000 for the repair of flood damage.

Rotherham R.D.C. £1,370, excess cost of water supply works.

LOANS SANCTIONED.

Aylesbury U.D.C. £600 for extending the battery at the electricity works.

Rawtenstall T.C. £2,216 for electric cables, transformers, and switchgear.

FORTHCOMING INQUIRIES.

SEPTEMBER.	£
5. **Penmaenmawr.** For laying out a cemetery (Mr. P. M. Crosthwaite)	—
7. **Shardlow.** For works of sewage disposal (Mr. P. M. Crosthwaite)	3,600

RE-USE OF OLD WOOD BLOCKS.

The city surveyor at Gloucester, Mr. E. W. A. Carter, would be greatly obliged if any engineer who has had experience of taking up, redressing and relaying wood blocks would send him particulars.

Birmingham Drainage Board.—It has been decided by the Birmingham Tame and Rea District Drainage Board to apply to the Local Government Board for sanction to a loan of £12,250 for the purchase of the freehold interest in about 123 acres of land at Erdington.

Prisoners for Sewage Works.—The Birmingham, Tame and Rea District Drainage Board are applying to the War Office for permission to employ German prisoners on their sewage works. If the application is granted, the men will be engaged on navvying work. It has been found impossible to obtain other labour.

Timber, Plywood, and Woodwork.—In next week's issue there will appear a page advertisement which will give various particulars of timber, plywood, and woodwork which Messrs. C. Jennings & Co. have for sale. The page will be found useful for reference by all who make use of such goods. The firm's head office is at Pennywell-road, Bristol, but they have branches at Leicester, Porthcawl, and stocks warehoused at Swansea, Hull, Pembroke Dock, Neyland, Newcastle, Manchester, Liverpool, and elsewhere.

Sewage Farm Managers and Military Service.—At the last meeting of Houghton-le-Spring Rural District Council the Sedgeletch Sewage Farm Committee reported that the clerk had again appealed to the County Tribunal for the conditional exemption of the farm manager, and had failed. The committee recommended that the clerk should advertise for a temporary manager at a weekly wage of £2. Mr. W. H. Handley said it seemed somewhat strange that, while they were being asked to do all they could to increase the food supply of the country, the authorities would not allow this man conditional exemption. On the council's farm he had to cultivate 10,000 celeries and 60,000 Savoy cabbages. He had 20,000 cabbages and 50,000 onions to plant. There were 350,000 cauliflowers ready for market. They had 3 acres of beet, 1 acre of leeks, 2 acres of rhubarb, 1 acre of turnips, ½ acre of rye grass, and a considerable quantity of parsnips and other produce. According to instructions sent to tribunals he understood that market gardeners were allowed to retain one man to 3 acres. Their farm had 23 acres, yet exemption was not granted to this man with all these hundreds of thousands of plants under his control.

Sanitation Problems in Civil Areas near Temporary Military Camps.*

By G. BERTRAM HARTFREE, F.S.I., ASSOC.M.INST.C.E.I., M.R.SAN.I. (Member), Surveyor to the Urban District Council, Alton.

In apologising for presenting this paper, the author's excuse is the fact that although sanitation difficulties met with in temporary camps, including temporary increase of size of permanent camps, has been dealt with by several authors, to the best of his belief those caused by the resultant increase of civilians in areas near camps have not formed a subject for consideration by any professional body previously.

CAUSE AND EFFECT.

Either the number of soldiers in camp A has been multiplied B times, or where formerly there was no camp suddenly there came into being something similar to that described by a well-known author as "Mudsplosh" camp; covering what was formerly dry turf, wild yellow gorse, and fragrant heather. The effect in either case is an influx of civilians, either relations who wish to be near the soldier husbands, fathers, or sons; or those seeking employment, engaged in business, and many more particularly out to make money. Under this last-named class is included all grades, from the established business man extending his scope of work, and descending stage by stage to the primitive form of individual known generally as a gipsy, but who, for reasons better known to himself, prefers to be called a "traveller."

HOUSING CONDITIONS.

It is doubtful whether more variable dwellings may be described in any other vicinity in the country than those seen during a five minutes' walk in the neighbourhood of a camp increased X times for the duration of the war. First may be seen what was formerly an isolated country residence, now hedged in by camp on the one side, and by brick, wood, and other civilian dwellings on the other sides. Near-by is a wooden erection with a tiled roof, and from the large lettered sign-board it may easily be discovered as the local branch of a London bank. Next occurs the inevitable "cinema," occasionally brick built, sometimes iron or wood, and as a last resort, canvas. From here one leads on to the "High-street," where are brick and stone erections planned on town lines and intended as permanencies, and adjoining wood or iron buildings, either taken from a stock design or built on stage by stage until the final result is a homogeneous mass of wood, iron and space.

Near-by are found the working-class dwellings, the design and construction of which is still more variable. Occasionally brick-built cottages are seen, cottages originally intended for occupation as such. Again, bungalows of the type commonly known as week-end bungalows are discovered, situate on possibly a sufficiency, more generally an insufficiency, of land; probably all that was required for the original purpose, but as the buildings are now let off as two-room tenements, the garden space is considerably restricted. Other types of residences include the gaily painted galvanised villa in the catalogue of some enterprising manufacturer, with a descending scale of iron buildings, from the home-designed house, constructed of second-hand corrugated-iron sheets, to the final stage of the gipsy habitation, armoured with flattened bully-beef tins, petrol cans, and such other similar iron the proud owner is able to "find." The more temporary habitations include, higher on the scale, the condemned army bell-tent, which is marked by broad arrows in pairs with points touching. An examination of these habitations will prove conclusively that the Army Stores Condemnation Boards are in no way wasteful. At the lower end of the scale may be seen the gipsy wigwam made from a large and varied assortment of materials; from the outside picturesque, the inside smoky, draughty, and to the venturesome who wish to investigate further, well occupied, and also strong in an olfactory sense.

OVERCROWDING.

The evil of overcrowding cannot be entirely removed, but at times may be reduced, as in instances where four persons occupy a room with 600 ft. of air space, while the "sacred" parlour is kept at all times as a sanctuary for the usual glass dome, sheltering gaudy artificial fruits or flowers; photographs of relatives in constrained postures, and the other appurtenant parts of such parlours. Improvement of overcrowding evils is practically limited to insistence upon uniform occupation of all suitable rooms, the removal, by tact or otherwise, of those whose presence in the area is undesirable, supported by education of the occupiers in the principles of natural lighting and ventilation.

REFUSE.

When the cottager in rural areas does not keep a pig, the usual practice is to dispose of house refuse by stacking in a heap away from dwellings, and allowing it to rot for manurial use, or digging direct into the ground. But in temporary congested areas cases often arise where the ratio of garden per tenement is too restricted to permit effective disposal in this manner, and no public system of scavenging existed in the pre-war period—in fact, it was unnecessary. A system even now may not be required for the greater part of the community, and if generally acceptable, other conditions arising from the war prevent its adoption. Many cases are found where offensive "dumps" exist, which might be prevented by the cottagers carefully sifting their ashes, burning the cinders, using the residue for home path construction. Ofttimes a quagmire footpath or backyard could be remedied by judicious use of the ashes which are generally intermixed in a heap with evil-smelling liquids and refuse. Too little attention is paid to individual effort in sorting house refuse; much that is allowed to fester and rot could be dried and burnt in the kitchen range. Excellent backyards have been made on foundations of old tins and broken crockery, with a surface of ashes. On the subject of home destruction of refuse, there appears an inventive necessity for an economical kitchen range to burn refuse; but assuming such to be discovered, as a race we are far too conservative to adopt it generally.

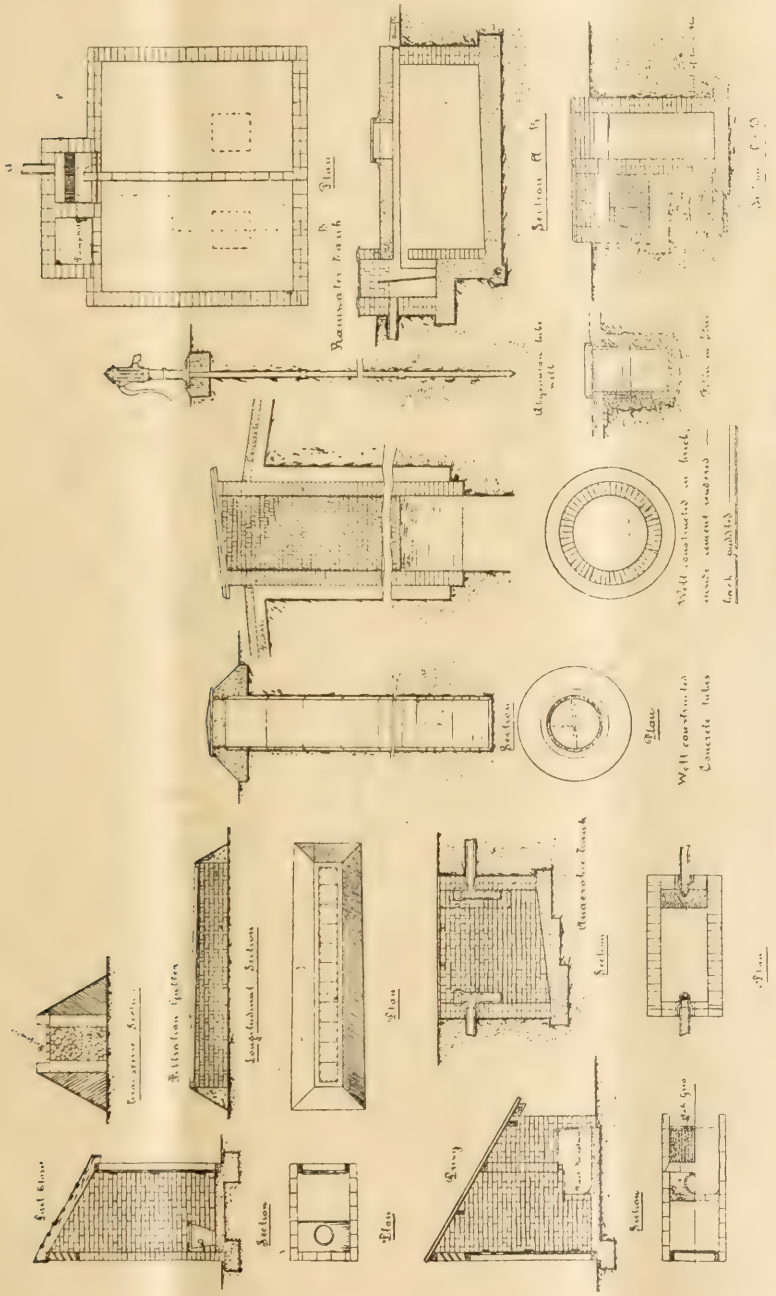
CLOSETS.

The areas under consideration are without a water-borne system of sewage disposal; in peace times probably the requirements of the community did not warrant such. A majority of the dwellings may still be well served by ordinary earth disposal, but others are very problematical. A common fault that can be remedied is the use, or abuse, of the privy or earth-closet as a receptacle for slops, &c. There is great ignorance or indifference shown by the average cottager to the principles of dry earth disposal. When earth is the deodoriser adopted, ofttimes it is dug and used wet or damp; far more suitable is the powdery top-soil. If not required for other purposes, ashes may be used with success, and the illustrations show a type of privy with iron bars at the back, upon which the residue from grates may be thrown, the cinders arrested by the bars, while the ashes fall upon the contents of the receptacle. Possibly the best material for use with this system is peat moss litter; the author has known instances where the contents of the pails have been emptied in a dry place; after a few months all traces of the excreta had disappeared, and the moss litter could again be used. A successful earth system requires a naturally dried deodoriser, full of micro-organisms of a useful character that will render the soil harmless and reduce it to its original chemical component parts. Artificially dried earths may be advantageous as compared with damp substances, but the procedure kills the bacteria that are required to perform the work of sewage disposal.

Should a self-contained home water-borne system be adopted, there is the option of either a cesspool or miniature sewage disposal works. The former may consist of a watertight receptacle with or without an overflow; or what is practically the same in principle as the latter, a single cesspool that is not

* Paper submitted at the annual meeting of the Institution of Municipal and County Engineers at Blackpool.

watertight. The objection to the former is the trouble of emptying. It must be remembered that these are not areas containing a preponderance of villas with every facility for the entry of vacuum cesspool emptying carts. To sum up, should there be sufficient land for disposal purposes, possibly an anaërobic tank with either subsequently land surface



Proposals for Improvement of Sanitation around Camps.

treatment or some form of bacteria system would be successful; or a watertight cesspool, the contents of which may be distributed on the surface of the land near by, may be preferable. There must be great risk in any form of underground soakage whenever the water supply is from local wells, and there is no doubt that in such cases the dry earth system is preferable, unless purification can be finally completed on the surface of the ground.

Disposal of Liquid Waste.

This is a serious problem, and is intensified by cottagers being permitted to wash soldiers' clothes in their own houses. This, in the absence of a water-borne system, results with low-lying areas naturally waterlogged, in a series of gardens closely akin to the paddy fields of the East, and lined with innumerable foul-smelling ditches. There are two alternatives for disposal, the old-fashioned cesspool, which either must be emptied or its contents permitted to soak into water supplies, or the adoption

of filtration gutters. The latter were the idea of Dr. Poore in India, and with a sufficiency of area properly applied should enable the disposal of all liquid sewage without bad effects. The principle entails the erection of parallel walls in brick or stone, laid pigeon-holed, which support perforated tiles, and surmounted by a coping; under the tiles and between the walls the space is filled with selected rubble, the outside is banked with earth, in which plants with an affinity for water are planted. Given suitable vegetation, Nature will solve the problem of liquid disposal, and if no other plant be required or obtainable, water lilies, in addition to absorbing liquids, will give a pretty and rustic effect.

WATER SUPPLY.

Common sources of water supply in rural areas are from local shallow wells, or rain-water off roofs. The former are generally designed by the local builder on lines adopted from his grandsire, and consist of open brickwork in a soil which, if not already polluted, will in all probability become saturated with filth at an early date. Very rarely does it occur to him that there are two "Q's" to consider in water supply—quality as well as quantity. Often a safe local supply may be obtained by backing the brickwork with clay puddle, and rendering the interior with a coating of cement, or a far sounder work could be made by substituting for rectangular shapes purpose-made bricks radiating to the diameter of well. Generally the objections to this system, even when common bricks are used, is the expense attached, and a far cheaper and equally effective arrangement is the use of purpose-made concrete tubes or stoneware pipes, while an alternative is a driven tube on the principle of the Abyssinian well. Stream supplies are subject to pollution, and a safer procedure would be sinking stoneware pipes into stream bed, surrounding the sides for a distance of 6 in. to 12 in. with clean hardcore or flint, and placing in the lower section fine washed sand which would be prevented from rising in the "dip-hole" by a sheet of fine-mesh wire gauze securely fixed between the spigot of the upper pipe and the shoulder of socket below.

THE SOLUTION.

Under similar conditions in many cases the solution requires a system of sewerage, a public supply of water, and municipal scavenging of refuse. For the special cases under consideration the objections to the first two (sewerage and water supply) include—cost, and delay in executing works arising from: (*a*) The usual machinery of progression; (*b*) scarcity of labour and materials. Against the last may be set: (*a*) Difficulty of obtaining horses and men; (*b*) the inadvisability of placing a burden upon those less able to bear it, to relieve those who are making large profits, but at the same time directly or indirectly causing special requirements to be necessary. For instance, the proprietor of a café informed the author that he would welcome a complete system of sewerage, water supply, and scavenging, as at that time he was paying 15s. per week, by private agreement, for sanitary services. The café in question consisted of a wooden carcase, the outside covered with galvanised iron, the interior lined with match-boarding. Upon the trade of the premises its yearly value could be placed at over £100; as a building apart from its trade, £20 would be the outside annual value. Many similar instances occur, and to generalise, any system on loan account would benefit the owner of the temporary building, but when normal conditions again arrived would place a heavy burden upon the permanent residents, who in the future probably will not require such conveniences. The author suggests as a present-day solution action strictly local in character. The local authority have ample powers to enforce the provision of sanitary requirements; special conditions require special treatment, and consequently it is suggested that in addition to the formal notices from the council, stating that certain specified conditions are insanitary, there should be established an educational assistance department which, while carefully refraining from prejudicing the position and statutory powers of the local authority, will supply general particulars of suitable construction as well as, when necessary, giving details of the most suitable single or alternative arrangement for particular cases considering geological as well as all other factors. This department would perform educational work, for the greater part of insanitary conditions arise from ignorance or indifference, and the cure for the former is education alone.

An example from recent practice is the following: A well 20 ft. in depth from the ground surface to top of water was found polluted, and the source of pollution could not be removed. It is suggested that the well as a well should be closed, that a false bottom be made in reinforced concrete, the interior of walls rendered in cement, made watertight and used as a storage tank for rain-water. Elementary educational principles upon water supplies include the advantages of driven-tube wells, concrete linings, &c., also the construction of filters to contain sand, polarite or similar substance, for the treatment of suspicious waters that cannot be dealt with in any other manner.

Upon soil disposal there are the alternatives dry earth or water borne, the former either fixed or removable receptacle, the latter either to a watertight cesspool or a miniature disposal works. For liquid disposal the author has seen satisfactory home land irrigation works, failing which there is the filtration channel or the watertight cesspool. Co-operation with the military authorities is required in dealing with the home washing trouble. There appear to be two courses open—either for the Army to provide temporary wash-houses in suitable positions and where waste water may easily be disposed, or supplying "washing" permits only to those houses where suitable disposal arrangements exist.

With respect to the treatment of refuse, there appears considerable need for education upon this subject; it may be burnt in the kitchen range; it can be destroyed in the garden, within a destructor consisting of three bricks upon which several old iron bars are placed, the whole supporting a 12-in. drain pipe, with its outside reinforced by fine wire netting. There is an alternative instead of stacking in heaps—dig holes, well pack the refuse to cause spontaneous combustion, and cover with earth from time to time.

By tact, perseverance and co-operation with all authorities, even if perfection be not attained, a great improvement may be effected.

OXFORDSHIRE MAIN ROADS.

COUNTY SURVEYOR'S REPORT.

The length of the main roads in the county of Oxfordshire is 481·7 miles, and in the past year they were maintained as follows: Urban main roads by district councils, 30·04; rural main roads by county council, 438·64; urban main roads by county council, 13·02. The above figures are exclusive of the length of the roads and approaches to railway bridges belonging to the Great Western Railway Company, for the maintenance of which an annual sum of £243 is paid to the council, and is included in the yearly estimates.

In his annual report, Mr. S. Stallard, the county surveyor, states that the total cost of the urban main roads for the year ending March 31, 1916, was £5,409 4s. After deducting the sum of £11 10s. received from the Great Western Railway Company for bridge roads, the nett cost to the county is £5,97 14s., and gives an average net cost per mile of £127, as compared with £139 the previous year. This reduction is mainly due to the non-completion of repairs during the year in the boroughs of Chipping Norton and Woodstock, owing to the difficulty experienced in obtaining the necessary quantity of material, and to a reduction made at Henley by arrangement with the borough.

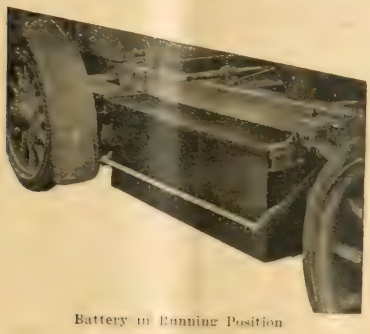
During the past year only necessary repairs to carry on the roads in the borough have been carried out at Henley-on-Thames, and of the total estimate of £370, nearly £200 has been expended on tar-painting existing tarmac surfaces, with very satisfactory results. A portion of the Reading road has been coated with Clee Hill granite, and the Tarmac in Bell-street has been retopped. The same amount of £370 has been allowed for the current year's maintenance, and with the aid of a special grant from the Road Board a considerable area will again be tar-painted.

Under all the circumstances, Mr. Stallard considers that the main roads have been maintained in a very fair condition.

Chimney as a Bedroom.—"The man sleeps on a dirty mattress and the woman sleeps up the chimney," said the surveyor to the Hatfield Rural District Council in complaining at a council meeting of a family who were living under filthy conditions. "Up the chimney?" asked a member. "Yes," said the surveyor. "It is one of those old-fashioned chimneys."

THE "ORWELL" ELECTRIC REFUSE COLLECTING AND TIPPING WAGON.

The restrictions on the use of petrol have already resulted in a very appreciable increase in the demand for vehicles which depend for their operation on other forms of power, and the electrically-driven type is coming into distinct favour, not only among traders, but with not a few officials of local authorities who



Battery in Running Position

Battery Pulled Out for Examination

previously had regarded it with something akin to distrust.

For work involving frequent stoppages the electric vehicle is now generally admitted to be particularly suitable, and in no direction probably can it be employed with greater advantage than in the collection of refuse.

In the 2-ton "Orwell" electric refuse collecting and tipping wagon, illustrated herewith, the efficiency of the combination of the modern storage battery, the motors and the simple mechanical transmission is very high, the makers claiming that from 60 to 70 per cent of the energy put into the battery is applied to the road wheels. The chassis includes a number of special features conducive to long life. For instance, the control of the motors has been designed to give exceptionally gradual starting. The front wheels are pivoted on inclined swivel axles in such a manner as to reduce the stresses on the front tyres to a minimum. Furthermore, the front-wheel drive, which is used on all "Orwell" vehicles up to and including 2½ tons' capacity, greatly reduces the tendency to skid, and thus eliminates one of the causes of tyre deterioration. For these reasons the "Orwell" is very light on its tyres.

As regards the battery, this is slung under the chassis in two boxes, each of which is arranged to slide sideways by pulling a handle-bar. The operation of raising the handle-bar lifts the battery box a fraction of an inch, throwing its weight on to rollers. By pulling the handle the battery slides out easily, and is readily accessible for examination. When the boxes are pushed back into position, the handle-bars are dropped, releasing the weight from the rollers and locking the battery in position.

The selling agents for "Orwell" vehicles, which are built by Messrs. Ransomes Sims & Jefferies, Limited, Ipswich, are Messrs. Mossay & Company, Queen Anne's-chambers, Tothill-street, Westminster.

2-ton "Orwell" Electric Refuse Collecting and Tipping Wagon.

REPAIRS TO BRICK CHIMNEY SHAFTS.

STRENGTHENING BY REINFORCED CONCRETE.

An interesting account of repairs to a dangerously-cracked brick chimney shaft, 150 ft. in height, which successfully transformed it to all external appearances into a concrete chimney, is given in a recent issue of our American contemporary *Engineering Record*. A reinforced concrete shell was built around the old brickwork, using the latter as interior forms and galvanised steel as exterior forms, without interrupting the operation of the plant. The total cost of the work was about one-half the original cost of the brick chimney.

A concrete casing 10 in. thick was placed around the base for a height of 37 ft. The brick was used as an inside form and the outer forms were of wood. Above the square base a circular metal form of No. 8 galvanised steel was used. It had a height of 42 in., tapered and this height was poured each day the weather permitted. All work was done while the chimney was in use during the past winter, starting in November, 1915. On the tapered shaft the concrete is 8 in. thick at the bottom and 6 in. thick at the top. The horizontal bands employed for reinforcement consist of ½-in. bars, spaced 24 in. apart.

Scottish Municipal Forestry.—Tain Town Council have sold the standing timber on their estate of Culpleasant for £2,000 to an Inverness firm, who have been allowed eighteen months to clear it off.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars have reached us during the present week. Other reports will be found on our "Local Government Board Inquiries" page.

HOUSING AND TOWN PLANNING.

Birkenhead T.C.—The medical officer of health, Dr. R. Sydney Marsden, in his annual report, lays emphasis on the importance of the housing of the working classes. "I do not think," he states, "that the demand will be met in the future by private enterprise, but will have to be provided by the corporation, and I estimate that at least 1,000 houses will have to be provided especially to meet the call for houses at low rents, of from 3s. to 5s. per week."

Stirling T.C.—A committee has been authorised to consider the question of a housing scheme to come into operation after the war.

MOTOR TRANSPORT.

Bacup T.C.—The first motor fire engine acquired by the corporation has been received and duly tested, the tests proving quite satisfactory. The cost of the engine was £1,100.

Blackpool T.C.—The cleansing department have purchased a second electric water sprinkler at a cost of about £1,000, and outside the town hall a test was carried out in the presence of the members of the committee. The committee discussed what should be done with the vehicles in the winter, and it was decided to have a wagon body made for one and use it for the delivery of coke.

Dover T.C.—The deputy borough engineer has recommended that the collection of refuse be commenced at midnight, thus freeing two of the five Edison electric wagons for other work in the early morning. It is expected that by this means a saving of £500 a year will be effected. The cost of refuse collection by the Edison wagons over a period of eight months works out at 4s. 10·21d. per ton, compared with 6s. 2d. by horses. It is proposed to do street watering and sweeping during the day, a machine-broom being fitted for the latter work. The corporation have given an order for a sixth vehicle.

Erith U.D.C.—A turbine motor fire engine by Messrs. Dennis Brothers, Limited, was delivered recently. It has a 35-40-h.p. engine, and has been subjected to successful tests in speed, hill-climbing, and general capacity.

Hull T.C.—The Health Committee have authorised a sub-committee to purchase a suitable chassis for a motor ambulance.

REFUSE COLLECTION AND DISPOSAL.

Aberdeen T.C.—The estimate of the Cleansing Committee for the ensuing year is £23,000, an increase of £1,063 over that of the past year, due to the high price of provender for horses, and also to the advance in the wages of the men in the carting department. The chairman of the committee, Councillor George, expressed the committee's appreciation of the efforts of Mr. Findlay, the cleansing superintendent, to economise in the department. While the saving he had effected had been considerable, it was, unfortunately, not sufficient to counterbalance the increases which had taken place in certain departments. In this, however, Mr. Findlay had been unable to effect further saving, but he deserved the thanks of the committee for what he had done.

Belfast T.C.—The medical officer of health, Dr. H. W. Baillie, in his annual report states that there are in the city about 82,550 houses, of which 56,847 have been provided with galvanised bins for the reception of house refuse; about 2,000 have other movable receptacles, and 23,703 have ashpits. The refuse is removed from the houses supplied with bins at least once a fortnight, and in some cases weekly. The following is a summary of the removal and disposal of the various forms of refuse from inhabited houses, business premises, &c., during the year: The number of cleansings of ashpits and ashbins amounted to 2,394,901; number of loads removed, 88,278; number of mattresses burned, 1,157; number of dead animals burned, 4,139; manure sent to country by rail, 5,213 tons; refuse burned by destructor, 16,035 loads; refuse sent to tipping grounds, 67,030 loads.

Blackpool T.C.—The Health Committee are proceeding with their scheme for dealing with the offal at the abattoirs, and have now purchased some of the necessary apparatus, which is in process of installation.

Irlam U.D.C.—The provision of refuse destructor plant is being considered.

Surbiton U.D.C.—The surveyor, Mr. H. T. Mather, has reported that it would not prove a remunerative undertaking for the council to make a separate collection of waste paper, and he suggested that if the inhabitants were requested to inform the council when they had sufficient paper to be removed, it could be collected and stored at the depot until there was sufficient to be sold. After some discussion the council resolved that in view of the shortage of labour and other special difficulties existing under the present circumstances no action be taken in this matter.

ROADS AND MATERIALS.

Barnstaple T.C.—The county council having proposed to allow only one-tenth of the cost of scavenging and watering main roads paved with wood blocks, instead of one-third as previously agreed, the town council have approved of a recommendation of the Main Roads Committee to insist upon adherence to the old terms.

Brigg R.D.C.—An application has been made to the Road Board for contributions towards the cost of diverting roads at Gunness and Habrough-road, North Killingholme.

Doncaster R.D.C.—An intimation has been received from the West Riding County Council that they are prepared to make a contribution of £658 towards the cost of the maintenance, repair, and enlargement and improvement of the Great North road and footpath from the Doncaster borough boundary to Rossington Lane—2½ miles in extent—as soon after March 31, 1917, as the county council are satisfied that the road and footpath are being properly maintained.

Dore (Hereford) R.D.C.—With respect to the proposal of the county council to take over the control of the roads, this council has resolved to endorse the views of the Ross Rural District Council, affirming: (1) That the county surveyor already had direct control of the main roads; (2) that it would be detrimental to make any change which should abolish local interest; (3) that overlapping would be greater, and it would be wasteful to have two sets of surveyors to go over the same ground; (4) that district surveyors were quite capable of carrying out repairs; and (5) that the change would entail great loss to the council in regard to the expensive plant obtained for the work of the roads.

Dorset C.C.—The council have decided to postpone till next spring the work of constructing the new main road to Lyme Regis.

Ham U.D.C.—The surveyor, Mr. R. W. Hindhaugh, has been asked to prepare an estimate for the repair of the footpath in Ham-street by laying Tarmac 5 ft. wide. This will be regarded as an experiment, and, if successful, may be extended to other parts of the district.

Hampshire C.C.—A claim presented to the Road Board for £4,932 in respect to extraordinary military traffic on the Tidworth and Grately road, the Amesbury and Weyhill road, and the Winchester, Alton and London road, has been reduced to £4,136 by the board and accepted by the council.

Hayle U.D.C.—The council have voted a sum of £100 towards the cost of repairing the road from the viaduct to Hayle Bridge. The estimated cost of the work is £700.

Helmsley R.D.C.—A petition has been sent to the Local Government Board and the county council asking for an increased grant in aid of the repair of the district roads which have been damaged by the timber hauling for Government purposes.

Holland C.C.—The Road Board have promised to

make a grant towards the cost of tarring Sleaford-road and Wainfleet-road, a width of 18 ft. to 20 ft. The contractors report that they will be willing to do the work at the same rate as last year—viz., 1d. and 19-20d. per square yard.

Llanelly R.D.C.—Some old property in Byrn-place has been offered to the council by the owner, Lady Howard, for widening purposes, on condition that the council defray the cost of making the road.

Londonderry C.C.—The necessary sanction having been obtained from the Local Government Board, the county council have agreed to borrow £10,000 to meet the expenditure to be incurred in making good the damage occasioned to roads and bridges in Limavady, Coleraine and Derry No. 1 by a rainstorm last July.

Perthshire C.C.—The Highland District Committee are considering the question of strengthening the roads in the neighbourhood of Loch Rannoch in connection with proposed works for the extensive haulage of timber.

St. Asaph (Denbigh) R.D.C.—A discussion arose respecting the tarring of roads, and members urged that it was time the council went in for their own tar-spraying machine, it being impossible to hire one. On it being stated that such a machine would pay for itself in about twelve months, it was decided to take steps to secure a machine, and to ask the St. Asaph (Flint) Rural District Council to join in the purchase.

Westhampnett R.D.C. The surveyor of the Lower District called attention to the difficulty experienced in obtaining the hand-picked flints allowed for that district, and suggested the use of gravel in place of the balance of flints required, approximately 2,750 yds. It appearing from information before the Highways Committee that there would be no difficulty in obtaining tenders for the supply of flints required provided the necessary labour to pick them could be obtained, it was resolved that the matter be left in the hands of the chairman to confer with the contractor, and to make inquiries in order to ascertain if the services of women could be secured to assist in picking the flints required.

SEWERAGE AND SEWAGE DISPOSAL.

Aldershot U.D.C.—Consequent upon complaints made by the Thames Conservancy Board with respect to the effluent from the sewage disposal works, the Health Committee recommend the construction of three primary, three secondary, and three tertiary beds at the works, and that one of the primary beds should be converted into an open tank, another primary bed to be constructed on a separate site in lieu of the one converted.

Burgess Hill U.D.C.—In ordinary times, the *Sussex Daily News* remarks, there would be interest just now in the peppermint crop grown on the Burgess Hill sewage farm, but in spite of the patriotic endeavour to further the cultivation of medicinal plants, the sewage farm is going strong this year on wheat and oats. Oats 7 ft. 2 in. high, and wheat 6 ft. high, with heavy crop of corn, are spoken of. Peppermint, it is stated, is a crop needing much labour to keep it clear of weeds, and labour is now scarce. It is also a very speculative crop, sometimes very remunerative and sometimes not. From accounts received of peppermint growing this year, the farm appears to have done well in reverting back to corn crops.

Chorley R.D.C.—The council have purchased a site at Heath Charnock for the purpose of a sewage disposal scheme.

Christchurch T.C.—The Local Government Board have declined to sanction a loan at present for a proposed surface-water drainage scheme.

Melton Mowbray U.D.C.—A modified scheme for the drainage of Asfordby Hill has been approved, and the inspector of nuisances has been asked to confer with the council with reference to a more elaborate scheme he has prepared, but which was considered to be too expensive.

Windsor R.D.C.—The Local Government Board have approved the plans and estimates of the Sunninghill and Sunningdale sewerage and sewage disposal scheme.

WATER, GAS, AND ELECTRICITY.

Aberdeen T.C.—For street repairs the estimate for the past year was £6,480, while the actual expenditure amounted to £3,345. For the ensuing year the estimate was fixed at £5,225, which is £1,255 under last year's estimate. This represents a saving of one-third of a penny in the £ in the rates. For the roads department the estimate last year was £12,373, and the actual expenditure £9,791, representing a saving of £2,582. For the ensuing year the estimate was fixed at £9,978, a reduction of £2,395 on last year's estimate, representing a saving on the rates of two-thirds of a penny. For the two departments the reduction in the estimate is £3,650, which will represent practically a penny in the £ less on the rates.

Ashton-under-Lyne T.C.—The Electricity Committee are asking the Board of Trade whether they will be prepared to consider an application by the town council to instal additional electricity plant.

Dundalk U.D.C.—A report is to be prepared by the surveyor, Mr. M. Sellars, and the electrical engineer on a proposal to heat the town hall and concert hall by means of electricity.

Dundee T.C.—It is stated that the reduction of the rates was practically due to the daylight saving Act and the compulsory reduction of street lighting, by which a saving of something like £8,000 can be effected.

Holywell U.D.C.—Attention has been drawn to the rapidly decreasing outflow of the famous well of St. Winefride, and it has been resolved to take steps to ascertain the cause, "with a view to safeguarding the vital interests of the town." Mr. Thomas Waterhouse, one of the members, said the cause might be found in the boring of tunnels, which was at present in operation, adding that if this continued Holywell would be drained of water.

Newton Abbot R.D.C.—The question of a water supply for Whilborough has been referred to the Parochial Committee for consideration and report.

Sheffield T.C.—It is intended to construct new electricity mains at an estimated cost of £1,000.

Sidmouth U.D.C.—On the recommendation of the Gas Committee, the council have agreed to pay £50 per quarter to the gas undertaking by way of compensation for the loss due to the non-lighting of the public lamps; also that the Finance Committee should pay to the gas undertaking £300 during the coming half-year should such a payment be required in order to provide working moneys. It was pointed out by the chairman that the restrictions of lighting and other conditions arising out of the war had necessitated the proposal, while the council, although possessed of the power to borrow up to £2,000 for the gas undertaking, was forbidden by the Treasury to incur any fresh loans.

West Ashford R.D.C.—It was reported that the Great Chart, Hothfield, Kingsnorth, and Shadoxhurst water scheme had been completed at a cost of £3,984, or £514 less than the estimated cost.

MISCELLANEOUS.

Alsager U.D.C.—The surveyor, Mr. H. V. Lynam, reported upon the wages paid to the council's employees, and, after discussion, it was resolved to advance the wages of the sewage works attendant by 2s. per week, and the wages of the roadmen and assistant pumper at the waterworks were increased by 1s. per week.

Axminster R.D.C.—The council have forwarded the plans of the surveyor, Mr. G. A. Millard, for dealing with the overflow of the river Coly into Tile-lane, Colyford, to the county council, asking for approval and contributions towards the cost of the proposed work.—The council have written to the Petrol Committee protesting against the allowance of petrol granted the surveyor for running his motor-bicycle. His average consumption was 10 gallons a month, and his allowance is only 2 gallons.

Blackpool T.C.—The committee in charge of the proposed extension of the promenade at South Shore have been asked to consider the desirability of constructing an open-air swimming bath in conjunction with the scheme of promenade extension.

Morecambe T.C.—The borough surveyor, Mr. F. W. Hopwood, has received instructions to prepare a plan and estimates for a new groyne at Bare.

FOR OTHER ADVERTISEMENTS
See End of Paper.

JUNIOR ASSISTANT (22 years), ineligible, seeks position in Surveyor's Office. Levelling, tracing and designing; clerical work if desired. Good references.—Box 1,581, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C. (3,078)

EXECUTION OF WORKS AFTER THE WAR.

PROPOSED OFFICIAL REGISTER: L.C.B. CIRCULAR TO LOCAL AUTHORITIES.

Sir H. C. Munro, secretary of the Local Government Board, has addressed the following circular to local authorities:—

I am directed by the President of the Local Government Board to state that the Government have under consideration certain questions which are likely to arise in connection with the demand for capital and the distribution of labour and employment at the close of the war.

It may perhaps be thought by some that it is premature to consider these questions in any detail at the moment. This is doubtless the case in relation to certain aspects of the question. Mr. Long feels, however, that due regard must be had to the magnitude of the questions involved, to the part which all classes of local authorities must take in furnishing information, and otherwise assisting in the solution of those questions and to the depleted staffs with which these local authorities have now to perform their duties.

Bearing all these points in mind, Mr. Long thinks that there may be distinct advantage in beginning the collection of some data which are necessary for the elementary consideration of the problems, and more particularly in such data as are likely to vary least with the progress of time.

He has in contemplation the establishment of a Register of Work available and likely to be undertaken at the conclusion of the war, and it appears to him that, while by no means excluding other sources of information, this can to a large extent best be compiled from information which local authorities may possess or be able to obtain both as regards works to be undertaken by them and also as regards other works to be undertaken in their areas.

Members and officers of local authorities have unique opportunities of obtaining accurate information on these points, and while Mr. Long would very much regret to add anything unnecessary to their labours at the present time, he feels sure that the advantage of starting betimes to obtain the material for such a Register as he proposes will be generally recognised. Consequently he appeals without hesitation to both members and officers of local authorities to take all steps within their power to obtain the material necessary to enable them to give as completely as possible the information asked for in the enclosed Forms A and B.

Mr. Long realises that it is impossible to forecast the position at the end of the war as regards either the supply of material or capital or the prices at which these can be obtained. These matters will largely affect the amount of work which will be undertaken at the end of the war, and may have the effect of materially restricting this work. At the same time the release of transport at present engaged on war work should have some effect in reducing the cost of imported materials, and there seems every reason to anticipate that plenty of labour will be available for almost every class of work.

So far as works to be undertaken by Local Authorities are concerned, these bodies will no doubt make such forecast of the future in their districts at the end of the war as their knowledge admits of, and will probably be able to say with some degree of accuracy what works they will be able or obliged to undertake when that time comes. Many of these works are of an urgent character, and have only been postponed in deference to the express desire of the Government to conserve all financial resources for the purposes of the war.

As regards works to be undertaken by private enterprise the case is more difficult, and Mr. Long recognises that the information obtainable cannot be regarded as absolutely reliable in all circumstances.

The inclusion of particular works in the Register cannot in any way bind the undertakers to proceed with those works, but it is hoped to secure, by means of the Register, a general idea of the character and extent of the works which may be undertaken at the close of the war and the capital and labour which they would absorb.

At the same time it is not desirable to include in the Forms particulars of works the putting in hand of which, upon the conclusion of the war, is for any reason problematical, but if on the other hand the works will be put in hand in the event of certain conditions being fulfilled the works should be included in the particulars given and the conditions subject to which they will be undertaken should be indicated.

Form A is intended to show the suggestions of each Local Authority as to works which might be undertaken by them in their various capacities on the conclusion of the war, and it is desired that it should be filled up as soon as practicable by the following Authorities: County Councils, Councils of all Boroughs and of Urban and Rural Districts, and any Joint Board consisting of representatives of any such Councils, Boards of Guardians of Poor-law Unions, the Metropolitan Asylums Board, and other Poor-law authorities having power to carry out works involving capital expenditure.

Form B is intended to show any definite information obtained by a Local Authority as to works contemplated in the area within their jurisdiction by bodies or persons other than the Local Authority, and it is desired that this form should be filled up by Councils of all Boroughs and of Urban and Rural Districts. This Form is therefore sent only to those Authorities.

If, as is possible, the information asked for in Form A can be furnished before that asked for in Form B, Mr. Long requests that Form A may be forwarded to this Office without waiting for the completion of Form B, which may be forwarded subsequently as soon as it can be completed.

In Form A local authorities are asked to furnish information under the following headings: (1) Short description of the works; (2) Degree of urgency; (3) Are the local authority prepared to undertake the works, subject to any necessary capital being available; (4) Approximate amount of expenditure involved; (5) Approximate period over which the works would extend; (6) Number of men who would be employed; (7) Authority for borrowing.

In Form B a short description of and the name of the body or persons proposing to undertake the works are asked for, other points on which information is desired being the approximate period over which the works would extend and the number of men who would be engaged.

PERSONAL.

Messrs. Jephson and O'Riordan, assistant county surveyors of Waterford, have had their salaries increased to £150, with an allowance of £25 for travelling expenses.

Mr. R. Kiernan, Dundalk, has been appointed surveyor to the Castleblayney urban district, in the absence of Mr. G. J. Skelly, who has joined the Royal Engineers.

Mr. F. E. Ennals, western district surveyor to the Billericay Rural District Council, Mr. R. J. W. Layland, western district surveyor, and Mr. S. J. Shelley, sanitary inspector, have been granted a war bonus of £10 each for a period ending six months after the proclamation of peace.

Mr. Charles W. Randall is leaving the Public Works Department, Hong Kong, having obtained an appointment with Dunlop Plantations, Limited, Malacca, Federated Malay States. Mr. Randall went to Hong Kong in March, 1913, under a three years' agreement, which has expired. Previous to that he was assistant surveyor to the Weybridge (Surrey) Urban District Council.

Mr. H. Wontner Smith, deputy engineer of the Bradford Corporation Sewage Committee, who has had charge of the Esholt tunnel undertaking, has been appointed manager of a large munition works in Lancashire. He will still remain in the service of the corporation, being enabled to take up the new work temporarily on account of the stoppage of the tunnel contract.

Mr. Clemens Herschel, who has recently succeeded Dr. E. L. Corthell as president of the American Society of Civil Engineers, is best known for his work in the field of hydraulics. His experiments in 1887 led to the invention of the Venturi meter and the derivation of the well-known formulæ for calculating the flow through large pipes. The principle upon which the Venturi meter is founded was first announced in 1797 in the published researches of J. B. Venturi, an Italian philosopher. He had observed that fluids discharging through an expanding nozzle exert a sucking action at the smaller diameter, which diminishes as the diameter increases toward the outlet. It is apparent that he considered this phenomenon scientifically interesting, but without practical value. Following Venturi, other engineers made occasional use of the peculiar property for various purposes. In 1887 Clemens Herschel conducted a series of tests to determine whether a definite relation existed between the difference in pressure at the inlet and contracted section and the rate of flow. Such remarkably uniform results were obtained that he patented the device, giving it the name of Venturi meter.

OBITUARY.

Mr. W. D. Gibbins, for many years borough engineer of Northampton, died, we regret to state, on Saturday last. After retiring he continued to act as architect to the Education Committee and surveyor to the Licensing Justices.

Captain Bernard Francis Cadic, who, we regret to state, has died from wounds and shell shock, was the son of Captain L. Cadic, R.E., now serving in the Naval Battalion of the Royal Engineers at the Front. Captain Cadic was educated at St. Lawrence's College, Ampleforth, Yorks, and served in the Officers' Training Corps. In 1912 he was articled to Mr. J. L. Redfern, borough engineer of Gillingham, Kent. Subsequently he was gazetted in the Territorial Force, R.G.A., and on the outbreak of the war was engaged on the Thames defences. Early in October, 1915, he proceeded to France with the 66th Siege Battery, and took part in the fighting in Flanders till June last, when he was wounded. He was only twenty-two years of age.

KILLED IN ACTION.

Captain E. W. Edwards, who before joining the Forces was surveyor and water engineer to the Blaenavon Urban District Council, was, we regret to state, killed in action on August 17th.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. JOHN S. BRODIE, M.INST.C.E., Borough Engineer and Surveyor, Blackpool.

District Chairman—Mr. J. S. PICKERING, M.INST.C.E., Borough Surveyor, Cheltenham.

SOUTHERN DISTRICT MEETING.

A Southern District meeting is to be held at Bristol on Saturday, September 16th.

PROGRAMME.

11.30 a.m.—Assemble at the Council House.
District Meeting.
Election of District Committee.
Informal discussion on papers describing works to be visited.

1 p.m.—Luncheon at Stuckey's Restaurant. (Tickets 2s. 6d. each.)
Drive to the Suspension Bridge, Clifton and Durdham Downs, Eastville refuse destructor, Barton Hill baths, inspecting en route six sections of bituminous road construction laid during the last four years. (Tickets for conveyance, 3s. each.)

6 p.m.—Tea at Stuckey's Restaurant by invitation of the city engineer.

NOTICES.

All members of the institution are cordially invited to attend.

In order that the necessary arrangements may be made, members must give notice of their intention to be present as soon as possible, and not later than September 9th.

F. R. PHIPPS,
Hon. District Secretary.
Borough Surveyor,
Basingstoke.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

CLERK OF WORKS.—September 14th.—Mullingar District Lunatic Asylum. £2 10s. per week. The Chairman, The Asylum, Mullingar, Ireland.

SURVEYOR.—September 14th.—Hollingbourn Urban District Council. £200 a year.—Mr. H. J. Bracher, clerk, Council Offices, 33 Earl-street, Maidstone.

SURVEYOR.—September 25th.—Warblington Urban District Council. £160.—Mr. J. W. L. Cooper, clerk, 14 Queen-street, Emsworth.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

WOLVERTON.—September 16th.—For alterations to the bathing place, for the parish council.—Mr. R. Williams, clerk, Church-street, Wolverton.

Engineering: Iron and Steel.

BRADFORD.—September 5th.—For the supply of one Willans' two-crank compound engine, direct coupled to Phœnix multipolar generator, having an output of 300 kilowatts at 500 to 550 volts, and 260 cells for storage battery, made by the Hart Accumulator Company, for the corporation.—City Electrical Engineer and Manager, Town Hall.

CORK.—September 7th.—For sinking well and supplying and erecting pump, for the rural district council.—Mr. J. Cotter, clerk, Board Room, The Workhouse, Cork.

MANCHESTER.—September 9th.—For supplying and fixing a 500-gallon petrol storage tank, for the board of guardians.—Mr. J. Macdonald, clerk, Union Offices, All Saints, Manchester.

SHEFFIELD.—September 11th.—For the supply of materials and works in connection with the laying of cast-iron water pipe and construction of chambers, for the Electric Supply Committee.—Mr. S. E. Fedden, general manager and engineer, Commercial-street, Sheffield.

RHONDDA.—September 12th.—For the supply of two scavenging wagons, for the urban district council.—Mr. E. H. Barber, engineer and surveyor, Council Offices, Pentre, Rhondda.

CAPE TOWN.—September 18th.—For the supply of pumps, motors, switch-gear, cables, cast-iron pipes, sluice valves, penstock gates and screens, overhead travelling cranes, and tipping wagons and rails, for the main sewage pumping station.—Messrs. Davis & Soper, 54 St. Mary Axe, London, E.C.

ARGENTINE.—October 13th.—For the supply of 27,807 metric tons of light pipes and 32,164 metric tons of heavy pipes of cast-iron, for the Ministry of Public Works.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, London, E.C.

SHEFFIELD.—For the supply of an electrically-driven pump, direct-current motor, boring plant, and rock-drilling apparatus, for the corporation.—General Manager, Water Department, Town Hall.

Mechanically-Propelled Vehicles.

SEVENOAKS.—September 11th.—For the supply of a steam motor wagon, with a separate tank of 1,000 gallons capacity, fitted for street watering, in addition to ordinary wagon-body, for haulage for the urban district council.—Mr. S. Towlson, surveyor, Argyle-road, Sevenoaks.

Roads.

LOFTUS.—September 2nd.—For the supply of broken whinstone and slag, for the urban district council.—Mr. Bernard J. Wormleighton, surveyor, Town Hall, Loftus, Yorks.

BEDFORD.—September 4th.—For the supply of 1,750 tons of broken granite, 4,740 tons of ironstone slag, and 1,600 tons of ironstone slag tar-macadam, for the corporation.—Mr. N. Greenshields, borough engineer and surveyor, Town Hall.

DEVIZES.—September 8th.—The town council have for disposal about 5 tons of Westrumite dust preventive, for roads.—Borough Surveyor, Town Hall.

MANCHESTER.—September 8th.—For the extension of granite rock asphalt carriageway, on concrete bed, for the corporation.—District Surveyor, Town Hall.

Sanitary.

GELLYGAER.—September 4th.—For the construction of sewage disposal works, for the urban district council.—Mr. T. R. Gabe, Council Offices, Hengoed, Glam.

SEATON DELAVAL.—September 4th.—For scavenging the district, for the urban district council.—The Surveyor, Council Offices.

EPSOM.—September 5th.—For the supply of horses and men in connection with the work of emptying cesspools, for the rural district council.—Mr. W. T. Wooldridge, surveyor, Waterloo-road, Epsom.

EPSOM.—September 5th.—For the removal of house refuse, for the rural district council.—Mr. W. T. Wooldridge, surveyor, Waterloo-road, Epsom.

ROWLEY REGIS.—September 5th.—For relaying and reconstructing sewers, for the urban district council.—Mr. W. Wright, clerk, Council House, Old Hill, Staffs.

BRIGHTON.—September 6th.—For the supply of glazed drain-pipes, for the corporation.—Borough Surveyor, Town Hall.

RATHDOWN.—September 6th.—For the extension of sewers, for the rural district council.—Mr. P. H. McCarthy, engineer, Clerk's Office, Loughlinstown.

CANNOCK.—September 7th.—For the removal of house refuse, for the rural district council.—Mr. J. T. H. Hall, The Oaklands, Brewood, Stafford.

HASLEMERE.—September 8th.—For the supply of about 350 yds. of hard crushed and uncrushed clinker for use as filtering media in percolating filters, for the urban district council.—Mr. H. V. Snook, surveyor, Council Offices, Haslemere.

MOTTRAM-IN-LONGDENDALE.—September 9th.—For cleansing closets and ashpits, for the urban district council.—Mr. S. Hudson, inspector.

BLAYDON.—September 12th.—For the removal of contents of ashpits, for the urban district council.—Mr. R. Biggins, Council Offices, Blaydon-on-Tyne.

Stores.

ROCHESTER.—September 5th.—For the supply of road metal, brooms, horse hire, and tools, for the corporation.—Mr. W. Banks, city surveyor, Guildhall.

SHEFFIELD.—September 11th.—For the supply of materials and works required by the Electric Supply Committee.—Mr. S. E. Fadden, general manager and engineer, Commercial-street, Sheffield.

Miscellaneous.

BRIGHTON.—September 6th.—For the supply of Portland cement, for the corporation.—Borough Surveyor, Town Hall.

BERMONDSEY.—September 8th.—For the removal of clinker and flue-dust from the destructor, for the borough council.—Mr. F. Ryall, town clerk, Town Hall.

NEWCASTLE-ON-TYNE.—For the removal of refuse to sea, for the corporation.—City Engineer, Town Hall.

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

SEPTEMBER.

16.—Institution of Municipal and County Engineers: Southern District Meeting at Bristol.

21-22.—Municipal Tramways Association: Annual Meeting, Surveyors' Institution.

23.—Institution of Municipal and County Engineers: East Midland District Meeting at Melton Mowbray.

30.—Institution of Municipal and County Engineers: Eastern Sub-District Meeting (Suffolk, Norfolk, and Cambridge) at Stowmarket

30.—Institution of Municipal and County Engineers: North-Eastern District Meeting at Wath-on-Dearne.

OCTOBER.

7.—Institution of Municipal and County Engineers: Meeting at Watford.

APPOINTMENTS OPEN.

SOMERSET COUNTY COUNCIL.
Wanted, Temporary Assistant in County Surveyor's Office. Must have good knowledge of modern road and bridge construction, be an active motor cyclist, and ineligible for the Army. Salary £120 and allowance of £30 per annum for upkeep of motor cycle. Apply, giving age and full particulars of experience, to

GORDON R. FOLLAND,
Acting County Surveyor.

13 Chamberlain-street,
Wells, Somerset. (3,066)

HOLLINGBOURN RURAL DISTRICT COUNCIL.
APPOINTMENT OF SURVEYOR.

The Council invite applications for the Appointment of a Surveyor of Highways for this District at a salary of £200 a year, the duties to commence on the 1st day of October next.

The appointment to be subject to termination by six months' notice. Applications must be accompanied by three recent testimonials to be received by me not later than 10 o'clock on the 14th day of September next.

By order of the Council,
H. J. BRACHER,
Clerk.

Council Offices,
33 Earl-street,
Maidstone.
August 24, 1916. (3,077)

APPOINTMENTS WANTED.

ASSISTANT (25), rejected for Army, desires engagement. General experience; good testimonials.—Box 1,572, office of The Surveyor, 24 Bride-lane, Fleet-street, London, E.C. (3,073)

TENDERS WANTED.

RHONDDA URBAN DISTRICT COUNCIL.
Firms in a position and willing to supply Two Scavenging Wagons, which shall be made to tip, and shall be suitable to be drawn by horses or used as motor trailers, are requested to apply to the undersigned for particulars as to details, &c., and Form of Tender. Completed Tenders are to be received by the 12th September next.

E. HAZLEDINE BARBER, Assoc.M.Inst.C.E.,
Engineer and Surveyor.

Council Offices,
Pentre, Rhondda.
August 23, 1916. (3,075)

THE TOWN COUNCIL of the BOROUGH OF DEVIZES have for disposal about 5 tons (surplus stock) of Westrumite (dust preventative for roads). Offers for purchase of this are invited, and should be sent to the Borough Surveyor, Town Hall, Devizes, by Friday, 8th September. (3,074)

PREPARATION FOR EXAMINATIONS.

THE UNIVERSITY OF LIVERPOOL.
SCHOOL OF ARCHITECTURE,
including
DEPARTMENT OF CIVIC DESIGN.
Professor of Architecture
C. H. Reilly, M.A., F.R.I.B.A.

SCHOOL OF ARCHITECTURE.

The School provides a thorough theoretical and practical training for students wishing to enter the Architectural Profession. The courses, which lead to a degree (B.Arch.), a Diploma and a Certificate, begin on October 5th. After a two years' course students obtaining a first-class certificate are exempted from the Intermediate Examination of the Royal Institute of British Architects. A special certificate of the University is given in Architectural Design. The designs required as testimonies of study for the Final R.I.B.A. are made in the School as part of the second-year work.

DEPARTMENT OF CIVIC DESIGN.
Professor of Civic Design:
L. P. Abercrombie, M.A., A.R.I.B.A.

The department provides a training for Architects and Engineers who wish to specialise in Town Planning. The courses lead to a Certificate and Diploma. The session consists of the Autumn and Lent Terms. Autumn Term begins on October 5th.

Prospectuses of day and evening classes may be obtained on application to the Registrar of the University.

(3,076) EDWARD CAREY, Registrar.

MISCELLANEOUS.

WANTED.—Three Copies of The Surveyor, 15th April, 1910. No. 952; vol. xxxvii.—Apply to the Publisher, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C.

WANTED—The Surveyor, vols. xxxvii. and xxxviii. (1910), either in loose numbers or bound in publishers' cases.—Apply to the Publisher, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C.

The Editor invites readers to forward regularly copies of annual and other reports, for notice in the columns of "The Surveyor."

The Surveyor

And Municipal and County Engineer.

Vol. L. SEPTEMBER 8, 1916. No. 1,286.

Minutes of Proceedings.

Gas and Electricity.

It has become so much the custom to regard gas and electric supply companies as natural rivals that the idea of both commodities being supplied by a single undertaking will come as rather a novel one to many who are not acquainted with the latest developments in the gas industry. At a meeting of the North British Association of Gas Managers, held at Edinburgh on Friday last, however, Mr. J. W. Napier, of Alloa, in the course of a paper on "Gas Authorities as Suppliers of Electricity," was able to show from his own experience that in a suitable district the combination is a sound commercial proposition. An electric lighting Order was obtained in 1899, and the town council immediately concluded an agreement with a company for a bulk supply for a minimum period of fourteen years, the corporation taking delivery of the current at a sub-station in the town and undertaking the distribution by cables laid at their own expense. The arrangement, however, was doomed to failure, and this Mr. Napier attributes entirely to the excessive rates of charge imposed upon the town council. Finally the agreement was terminated by mutual consent, the corporation paying an indemnity of £3,000. The council then had to consider the question of erecting a station of their own. As Mr. Napier points out, the ideal site for an electric station is a point in the centre of, or so far as is practicable nearest to, the area of greatest demand for current, in order to reduce the cost of supply cables, which otherwise would require to be larger and carried a considerable distance at greatly increased cost. Ultimately the gasworks site was decided upon, and has proved most satisfactory, the convenience and advantages being real and considerable. Suction-producer gas plant with gas engines was decided upon as the most economical type of plant best suited to the local circumstances. In 1910, as a commencement, one 85-brake-horse-power and one 140-brake-horse-power gas engine, with dynamos direct coupled, with one producer gas plant for use with gas coke, were installed. These were added to in 1911, but three years later the demand for electricity had increased to such an extent that further extensions became necessary, and a much larger unit was installed—a vertical engine of 600-brake-horse-power, together with two sets of producer plant of ample capacity. The supply is on the three-wire system—200 volts for lighting and 400 volts for power. Since 1914 the output of current has rapidly increased, and at the present time a 700-brake-horse-power engine and generator are in process of erection. The greatest increase of energy has been for power purposes, and this has had a very important influence on the working results and success of the station. With an industrial day demand, and therefore a long hour-load, the plant is kept working when otherwise it would be largely standing idle, and would be running only during the short period of peak load. Between 1910 and 1916 the output of electricity has increased from about 100,000 units to about 800,000. At the same time every facility is given to consumers to take advantage of the use of gas, with the result that, taken on the basis of population, the consumption of gas is considerably higher than in most towns in Scotland.

The experience of Alloa certainly shows that in that district—which is typical of many others—electricity has a permanent place in public demand coincident with a large consumption of gas, and that competition does not enter in to destroy the interests of either department. There would seem indeed to be little danger that if a gas undertaking embarks upon an electricity scheme the consumption of gas will be lessened to make room for the new commodity. On the contrary, the electricity scheme may fairly be regarded as a means of pursuing the same line of business by a different avenue. There seems to be full justification for Mr. Napier's conclusion that if the area concerned is a suitable one (industrial to be preferred, in order to obtain the highly valuable day load) the electricity side of the business can be made independently remunerative.

* * *

The Management of Sewage Disposal Works.

The importance of providing for the proper management of sewage disposal works has been mentioned in these columns on a number of occasions in the past. A striking reminder of the fact was contained in a casual remark made in the course of a description of the new sewage disposal works at Caerphilly, which was printed in our issue of August 11th. These works were designed to deal with 160,000 gallons per day dry-weather flow, which amounts to about 260,000 tons per annum of foul sewage, together with the usual allowance of storm water, and the whole plant is so arranged that only one man is required to manage and control the entire process.

The figures would be still more striking in the case of larger works. This eminently satisfactory result is, of course, almost entirely due to the facilities provided by the engineers when they designed the works, by which it is made possible for one man to control and operate the various stages of the complete process of treatment through which the sewage passes before it is discharged into the stream in the form of a bright and perfectly clean effluent. In spite of all the engineer may do to render the work of the manager as easy as possible, and to make the operations automatic, where suitable, the human element is the most important factor in securing continuous satisfactory results. Lack of experience of the particular system in use, or neglect due to laziness, will soon spoil the best designed works and render them ineffective.

These facts are becoming more generally recognised than they were a few years ago, but instances still occur where a labourer of the "intelligent" type is considered good enough to have sole control of a sewage disposal works on the latest system. If the man has had no previous experience it requires a long time, and it is sometimes impossible, to teach him the fundamental principles of the various processes. On the other hand, the man who has had some slight experience elsewhere of some other type of treatment may, in excess of zeal, utilise the opportunities to apply the "little knowledge" he possesses with highly injurious results. Especially is this the case if some emergency should arise unexpectedly. There is some difficulty in ascertaining the capabilities of men applying for appointments as managers of sewage works, but this could be overcome if it were made essential that in every case the man should be able to show that he had had several years' actual experience under a member of the Association of Managers of Sewage Disposal Works before he was allowed to have sole charge of any works. The chief obstacle to the employment of competent managers is, however, the meagre remuneration so frequently offered for their services, and this is due to the ignorance of members of local authorities who cannot understand that a modern system of sewage treatment consists of a series of delicate scientific processes each of which requires the most careful regulation and adjustment in order to produce the conditions necessary for its successful operation. A proper knowledge of these conditions can only be attained after several years of practical experience, and even then sound judgment is frequently required to deal satisfactorily with contingencies which may arise unexpectedly in any works. A man with these qualifications is not willing to undertake the responsibilities of a sewage works manager for the wages of a labourer. At present the only apparent remedy is to do everything possible to enlighten the minds of the members of local and other authorities, first to the importance of securing proper management of their sewage disposal works, and secondly to the necessity of employing thoroughly competent managers, if they wish their works to be maintained in a permanently satisfactory condition.

* * *

Security of Tenure.

We have already published at length the excellent paper on "Surveyors: Their Security of Tenure and Defence," which was read at the recent Blackpool meeting of the Institution of Municipal and County Engineers by Mr. J. H. Drew, the engineer and surveyor to the Wath-upon-Dearne Urban District Council, and our own views on the subject are by this time well known to our readers. Judging, however, from the tone of the leading article in the August issue of the *Municipal Officer*, the official organ of the National Association of Local Government Officers, it seems that the peculiar position of surveyors as regards security of tenure is not yet appreciated, even by those whose special business it is to watch the interests of the Local Government service as a whole. Our esteemed contemporary evidently resents the suggestion that surveyors stand in greater need of some measure of security of tenure than any other class of municipal officers, and insinuates that any effort on the part of surveyors to act for themselves in this matter is something in the nature of an act of disloyalty to their colleagues in other branches of the service. With all our admiration for the work of the N.A.L.G.O., and our belief in the value of organisation, we are bound to say that we cannot agree with this view. That surveyors stand in special need of protection is clearly shown by the cases of wanton dismissal from office that are constantly occurring, the reason being that their work if conscientiously performed must in the nature of things often bring them into direct conflict with the worst type of local councillor. Nevertheless, we are told that, "whether the desire is to obtain security of tenure of office, superannuation, or any other improvement in the service conditions, we shall have to realise in the very first stages of discussion that methodical organisation of the whole forces of the Local Government service is the only way to success."

What, it may fairly be asked, has the N.A.L.G.O. done to further the *special* claims of surveyors to security of tenure? Whatever may be the answer to this question, there surely can be no objection to surveyors themselves strengthening the case for improved conditions by action through their recognised professional institutions? Our contemporary interprets the omission of Mr. Drew's paper from the realm of discussion at the meeting, not as indicating lack of interest in the question, but as showing that many surveyors are of opinion that the Institution of Municipal and County Engineers is not a body to spend its time upon questions affecting *service conditions* of its members. If this is the official view of the N.A.L.G.O., we hope that the council of the institution will not be long in correcting it. We have on many occasions expressed our sense of the value of the work of the N.A.L.G.O., and urged that all municipal engineers and surveyors ought to strengthen its hands by becoming members. This opinion we still strongly hold, but we do at the same time feel that any class of municipal officers having a special grievance must be free to secure its removal by organised effort in conjunction with, or if necessary apart from, the National Association.

* * *

The Birmingham Housing Proposals.

The difficulties, economic and administrative, which beset the housing question were promptly disposed of at the Trade Union Congress at Birmingham on Saturday last. A comprehensive resolution involving considerations of far-reaching importance was carried unanimously. This, while affirming the impossibility of local authorities framing housing schemes "that fulfil modern requirements, especially accommodation that can be let at a rental within the means of wage-earners," calls upon the Government to assist these authorities by contributing money from the National Exchequer equal to not less than 20 per cent of the sum sanctioned by the Local Government Board for the provision of housing schemes, and urges "that not less than £20,000,000 should be set aside for housing purposes." At the same time the resolution demands that, "in view of the reluctance of the local authorities to prepare housing schemes, the Local

Government Board shall issue a special order making it compulsory on local authorities to exercise their powers under the Housing Act, so that schemes can be proceeded with immediately after the termination of the war." It would be useless to deny that the local authorities have been faced with many obstacles in the desire to frame housing schemes that shall be established upon a financially sound basis, and if the truth were told this more than any supposed sympathy for private interests or the much-despised speculative builder has influenced them in their hesitant policy with respect to the provision of working-class houses. The proposals formulated at Birmingham would doubtless tend to remove the obstacles to municipal action, but they will need to be very carefully considered in view of the fact that they would presumably involve grants from the Exchequer in aid of land owners, wages, and rents. In view of this the further resolution passed by the conference protesting against the suggestion that "public money should be used to assist limited liability companies and private owners to build houses that will be let at rentals based on the ordinary laws of supply and demand," seems, it must be confessed, a trifle inconsistent. In any case, it is at least welcome to find that the Trade Union Congress should have crystallised their housing policy in a manner involving a clear-cut issue for public discussion.

* * *

Municipal Co-operation.

The very existence of the various institutions representing the professional interests of municipal engineers is in itself a recognition of the principle that the experience of each may with advantage be rendered available for the benefit of all. The same principle, too, affords the chief justification for the publication of technical newspapers, and the inclusion in their pages of tabulated information like the "Comparative Reports of General Practice" which have always formed such a popular feature of this journal. It would appear, however, that, notwithstanding the efforts of all existing agencies, there is still much duplication of time, labour, and expense in obtaining information about systems, costs and results in regard to various matters of municipal administration. In New York State an attempt has been made to promote efficiency and economy in the collection and dissemination of such statistics by the establishment of a central clearing-house of municipal information run on co-operative lines. The bureau serves fifty-seven cities, and its primary function is to supply information about any municipal problem to any New York State city official who may request it. It also keeps city officials in touch with one another by distributing new ideas and plans, while another duty performed is that of keeping cities informed about any legislation that may affect their interests. There is no organisation quite on these lines in this country, although much admirable work of a cognate kind is done by such bodies as the Association of Municipal Corporations and the District Councils Associations. Inasmuch as collated information of the kind indicated is of special value to the engineering officials of local authorities, the subject is one which has a peculiar interest for them, and we cannot but believe that the establishment in this country of a central bureau under official auspices similar to that now in operation in New York would result in a considerable saving both of time and money.

* * *

Work After the War.

There can be no question that the Government, through the Local Government Board, are acting wisely in taking steps to ascertain what public and other works will be ready for execution at the end of the war, with a view to the prompt organisation of the vast amount of labour that will be set free on demobilisation. In our issue of last week we published in full the text of an official circular on the subject which has just been issued to local authorities. The immediate object of the circular is to obtain material for the compilation of a register of work available and likely to be undertaken on the conclusion of hostilities, but its issue will certainly serve an important secondary purpose in leading local authorities towards a comprehensive and systematic investigation of after-war conditions. The information sought is not confined to works to be undertaken by local authorities themselves, and a second return is asked for showing any definite information obtained by a local authority as to works contemplated in the area within their jurisdiction by other bodies or persons. No local authority need be afraid of committing itself to any expenditure by filling in the returns, for it is made quite clear in the circular that the inclusion of particular works in the register cannot in any way bind the undertakers to proceed with those works, the general object being merely to gain as accurate an idea as possible of the character and extent of the works which may be undertaken at the close of the war and the capital and labour which they would absorb. The loyal co-operation of all will assist the Government in their difficult and important task of reconstruction.

* * *

Politics and Administration.

Although interference of a political or semi-political character with the purely administrative work of municipal officials is not entirely unknown in this country, it is at least satisfactory that the American system of appointment and dismissal on purely party grounds has no place in our system. We are glad to be able to record that even in America, in a recent case at Boston, some engineers who were employed by the city authorities and had been dismissed for political reasons have succeeded in their plucky fight for reinstatement. Under the guise of the abolition of positions for the sake of efficiency and economy these officials were summarily removed from office. They took legal proceedings with a view to securing reinstatement, and the evidence clearly showed that the real reason why their services had been dispensed with was lack of political activity in favour of the mayor, as shown by failure to attend party meetings and to contribute to party funds! It was further shown that in at least one case the successor of the dismissed official was incompetent. In these circumstances the judge decided that the men had been removed or displaced in bad faith, and ordered them to be reinstated. This result does great credit to the officials concerned, who, by their vigorous action, have struck a great blow for the cause of good, clean, municipal government in America.

War Minister and Drains.—Mr. Lloyd George (the *Times* reports) was taken to task by the chairman of the St. Asaph Rural District Council at the last monthly meeting for having on August 20th opened a Nonconformist hut at Kinmel Camp, near Rhyl, the plans of which had been returned by the council on the ground that the drains were not in order and had not been resubmitted. The chairman maintained that Mr. Lloyd George had no right to open a building before the plans had been passed, and suggested that he should be written to and asked by what right he did so. Other members of the council, however, objected strongly to this suggestion, and pointed out that Mr. Lloyd George would not know that the plans had not been passed, and that he was not supposed to inspect the drains of every building he opened. This counsel prevailed, and it was decided simply to call for the resubmission of the plans.

Some Ideas in Sewer Work.*

By W. G. CAMERON, B.Sc., District Engineer, Sewer Section, Department of Works, Toronto.

In the natural course of events, in sewer construction in the city of Toronto, a few ideas have been developed which, although not entirely new, are greatly in advance of methods formerly used. Although these new schemes have not entirely eradicated the faults which they are intended to correct, they have proved efficient in 99 per cent of the cases where they have been used. Accordingly, they have been universally adopted in the city. The more important of these developments are detailed herewith.

CANVAS COVERS.

In the case of tile-pipe sewers in wet trenches it was found almost impossible to prevent leaky joints.

Fig. 1.—Showing Canvas Cover in Place on Bell End of Pipe, Ready for Spigot End of Next Pipe.

This view shows the efficiency of these covers. Note the water in the trench, kept out of pipe by the covers over the joints in background, which are concealed under three inches of concrete.

The universal practice is to place a rope of gaskets around the spigot end of a pipe, and when this pipe is pushed home into the socket of the pipe previously laid, the gasket is pushed into the back end of the joint, thus sealing the opening. The remainder of the joint is then filled with neat cement. In a wet trench this cement will be washed out unless measures are taken to prevent it. In some cases grass ropes, sods, clay ropes, pieces of burlap, &c., are wrapped

Fig. 2.—Completed Canvas Cover on Joint.

around the joint; but they require a great deal of labour, and prove successful only where there is a small amount of water present.

The necessity thus presented itself of finding a method which would require less labour and be efficient in all cases, including the most difficult—that is, in running-sand trenches.

Canvas covers were designed, were tried out, and upon proving successful were put into general use. These covers, made of medium weight canvas, are turned under on each side, making a ¾-in. hem, through which No. 14 soft iron wires are passed. One side is fastened (by tightening the wire) behind the

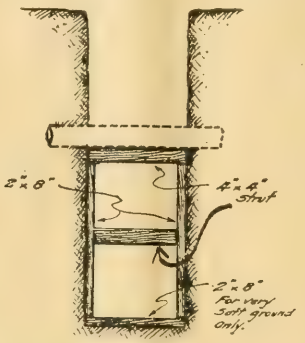


Fig. 3.—Protection Against Mains Settling.

collar of the pipe before it is lowered into the trench, and the other side is turned inside the collar. (See Fig. 1.) When the next pipe is ready to be placed, this side is pulled out, and when the joint is made, is fastened over the spigot end. Thus the joint is completely covered and protected. (See Fig. 2.) A different width and length of cover is required for each size of pipe. Fig. 1 shows how efficient are these covers. These covers were invented and designed by Mr. Worthington, chief sewerage engineer, Toronto, as was also the template described below.

TEMPLATE.

In Toronto, as in many other places, the Works Department requires 3 in. of concrete around all sizes of tile pipe over 12 in. in diameter. It has been found difficult to get the pipe-layer always to trim the sides of the trench so as to get a uniform 3 in. thickness of concrete. Most of these men are

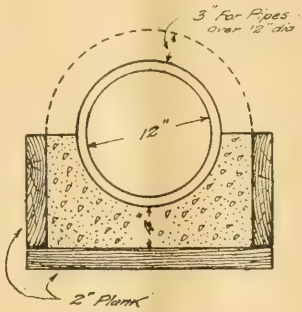

Fig. 4.—Type of Construction to be Used in Soft Ground.

foreigners and do not clearly understand when the inspector requests them to trim the trench properly. A collar or template goes over the pipe behind the bell and always shows clearly the width of trench required to give the necessary 3 in. of concrete around the pipe. The body of the template consists of four pieces of wood, each 2¾ in. wide by ⅞ in. thick, the length depending upon the size of the template, which, of course, depends upon the size of pipe. Two of these pieces are straight, for the sides. The two others, for the top, are cut so as to form a semi-circle. A

* From the *Canadian Engineer*.

light angle-iron, 1 in. by 1 in., is placed around the inner side, and the outside is covered by a 1-in. steel strap, ½ in. wide. The outer strap is raised at the top to form a handle.

SERVICE SUPPORTS.

Where a trench is opened in a built-up street there are always numerous gas and water services crossing the trench. These must be supported. If they are not, a sag will invariably occur when the weight of the back-fill comes on top of them. When these services are of iron, a low spot is formed, and probably they will pull out at the main, thus causing a leak. In the case of gas, moisture condenses and stays in the low spot, and in time causes interruption in the flow of gas. When the service is of lead, which is now generally used for water services, there is no danger to be feared from sagging, but it may pull out at the main and thus cause a leak. To avoid these troubles, it has been found advisable to use the following support, which is less expensive than repairs.—

Two legs 2 in. by 8 in. by length; one sill 2 in. by 8 in. by length under the tile pipe; one cap 4 in. by 4 in. by length; one strut 4 in. by 4 in. by length between the legs, to prevent them from buckling. (See Fig. 3.)

The size of this support may be increased when it is necessary to protect a main. For services the average bill of material is 30 ft. B.M. lumber, and requires from half to one hour's labour to cut the pieces and put them in place. The average cost is $1 for each service protected, while if the service is not protected and is subsequently damaged, the repair will cost from $5 to $10. Breaks or interruptions invariably occur either in the trench, union or main where proper protection is not given, while they practically never occur where the above-mentioned protection is used.

PROTECTION GIVEN TO A SEWER IN SOFT GROUND.

Where the ground is of a soft nature a pipe would unquestionably settle, or perhaps rise, as soon as placed. Under such conditions it has been found advisable to use the following construction:

The earth is taken out to a depth of 7 in. below grade and the trench made wider by 4 in. A box or trough is then made as shown in Fig. 4, 2-in. plank generally being used. This box is 6 ft. or more in length, according to convenience. It is lowered to the bottom of the trench and set to grade 5 in. below the grade of the pipe; 4 in. of concrete, 1:3:5 mix, is then placed in the box, the pipe set to grade, then the sides filled with concrete. Sometimes, where the ground is very soft, such as in the case of running sand, it has been found advisable to drive small stake-piles to resistance on either side of the trench, and about 3 ft. apart. Sills are placed on them across the trench and then the box is placed on these sills.

HIGHWAY SURVEYORS' SALARIES.

COUNTY COUNCIL'S OBJECTION TO INCREASES.

At last Tuesday's meeting of the Keynsham Rural District Council the receipt of the following letter from the clerk to the Somerset County Council was reported:—

"I am directed by the county council to give the rural district council notice . . . to terminate the present agreement for the maintenance and repair of the main roads on March 31st next. The reason for this notice is that one of the rural district councils has increased the salary of their surveyor without consulting the county council beforehand, and I am to inform you that the county council will be prepared to withdraw this notice on receiving an undertaking not to increase the salaries of any highway surveyor, his assistant or clerk, or the amount of the travelling allowance made to them in respect of their highway duties, so as to increase the amount of the charge to the county council under Clause 10 of the agreement, without the previous written consent of the county council."

The clerk (Mr. F. S. Whittuck) said that this seemed rather a high-handed action because one council—not the Keynsham Council—had broken away. They had always consulted the county council.

It was finally agreed that a reply be sent to the effect that the Keynsham Council had already agreed to the conditions laid down by the county council.

ABERDEEN WATER SUPPLY.

ENGINEER'S ANNUAL REPORT.

In his report for the year ended May 31st last, Mr. C. H. Roberts, M.INST.C.E., the city water engineer, states that the population supplied by the Aberdeen Water Department was about 166,000 persons. The area of the city is 6,748 acres, and the rateable value £979,350.

Owing to the balance from the revenue account of the previous year, the domestic water rate was reduced from 4d. to 2d. in the £, and the public water rate from 1d. to ½d. in the £. The charge by meter was reduced 12½ per cent from the charge of the previous year, which was 5d. per 1,000 gallons for the first 5,000,000 gallons, decreasing to a rate of 2d. per 1,000 gallons for all quantities in excess of 30,000,000 gallons during the year. The usual charges for miscellaneous purposes were reduced by 15 per cent.

During the past year the average rainfall in the Dee watershed above the waterworks intake, estimated from the gauges available, was about 45 in.; this is considerably above the average. It is equivalent to 346,000 million gallons of water. The water which flowed off this gathering ground, as observed at the waterworks intake, amounted to 223,000 million gallons, which is equivalent to an average rainfall of 29 in. The loss due to absorption by vegetation, evaporation, percolation and underground flow amounted to 123,000 million gallons, which is equivalent to 16 in. of rainfall. This loss is several inches greater than the average for the previous four years. The river during 1915 was not remarkable either for very low flows or for any excessive floods.

NEW WORKS.

The 1916 Corporation Water Act confers powers to make new waterworks at a cost of £450,000, and to abstract an additional 3,000,000 gallons of water from the river Dee, or a total of 11,000,000 gallons per day. The new works include intake works, storage reservoirs at Invercannie, additional filters, an aqueduct from Invercannie to the city, pumping station extensions, and a service reservoir near Mannofield. No money, however, is to be borrowed during the continuance of the present war and twelve months thereafter, unless the consent of the Treasury has been previously obtained.

By the Act Parliament confirms the principle that an abstraction of water from a lowland river is on a different footing to an abstraction from an upland stream, and that the provision of compensation, either in water or money, is not a necessary obligation in the former case. The corporation comes under the obligation to supply water if required on the route of the aqueduct to various places in the counties of Aberdeen and Kincardine, and to various landowners.

The new works at Invercannie, including alterations to the existing reservoir and the construction of new sand filters, &c., were completed in November, 1915; most of the filters had been in use for several months previously. The roofing-in with reinforced concrete of the No. 2 reservoir at Mannofield (378 ft. in diameter) was completed in the summer of 1915. The extensions to the irrigation farms of Tarland and Lumphanan were practically completed at the end of 1915.

The maximum day's consumption was 7,594,250 gallons. During the war, and owing largely to the effect of the war on the shipping trade, the consumption of water by shipping has fallen from 52,000,000 gallons to 26,000,000 gallons.

The average rate of working of the filters for the last seven months was 3,500,000 gallons per acre per day. This rate is higher than that which is usually expected to give the best results. It is, however, at present fixed by the area of filters constructed and by the area of land owned by the corporation. Mr. Roberts considers that the additional filters provided for in the Water Act should be constructed as soon as the war is over. The filters have had a considerable influence in reducing the colour of the water when brown. The total quantity of lime added to the water during the year was 130 tons.

Re-use of Old Wood Blocks.—The city surveyor of Gloucester, Mr. E. W. A. Carter, would be greatly obliged if any engineer who has had experience of taking up, redressing and relaying wood blocks would send him particulars.

THE INSANITARY GULLY.*

By J. T. Neech, M.D., D.P.H.,
Medical Officer of Health, Halifax.

In the sanitary progress of to-day, and among the improvements which have taken place in sanitary appliances generally, it appears to me that the time is more than ripe for the serious consideration as to the necessity for the continued use of the gully.

I am not going to say that catchpits and even gullies may not be necessary under special circumstances and for emergency requirements, but for general use in streets (especially paved streets), alleys, courts and back yards, they are, in my opinion, not required.

It would appear that the U trap, the self-cleansing trap, is a necessary evil; but the gully as it exists in general use to-day is an unnecessary abomination.

Take first the street gully, which is usually 12 in. in diameter, with a 6-in. outlet. Why is a 12-in. inlet necessary? Engineers do not, as a rule, connect up a 12-in. to a 6-in. sewer; but this principle is carried out in the street gully, with a miniature cesspool thrown in, holding 7½ gallons of solid and liquid filth. Into many of these gullies, in the narrower streets, household slops and other objectionable sewage matter is cast, there to undergo decomposition.

These gullies require periodical cleansing, and the usual method adopted is to remove the more solid contents with a scoop from the gully to the surface of the street. After a varying period a cart comes round to collect the material. It is impossible thoroughly to cleanse the surface of the street, and what is left dries into dust, and is scattered by air currents.

It is true that the suction method of emptying street gullies is on the increase, and it is an improvement upon the scoop method, because the surface of the street is not polluted, and the interior of the gully is better cleansed.

But by neither of these means can the gully be efficiently cleansed. The most thorough cleansing and purification of street gullies only occurs during heavy rains and continued wet weather.

The above state of matters constitutes a nuisance; the street gully is an insanitary appliance, and this nuisance could be largely obviated by substituting a 6-in. U self-cleansing trap, which holds about 5 pints, against 7½ gallons, which is the capacity of the 12-in. gully.

SINK WASTES.

With regard to the provision made in back yards for the reception of waste water from the sink, and surface drainage generally, gullies and traps of various sizes, shapes and capacities are met with.

Formerly it was the custom to provide a 6-in. gully for the sink waste, which would hold about 10 pints of liquid and solid filth, but in recent years the tendency has been to replace and substitute 6-in. and even 4-in. U self-cleansing traps, the capacity of the better made of the former being about 5 pints, and of the latter 3 pints. I contend that the smaller trap is the better from every point of view; it holds up the smallest amount of filth, its contents are frequently renewed, and it is consequently the most sanitary.

It matters not how much water is disposed of upon the sink, the contents of the 6-in. gully can never be completely changed and renewed, but 1 gallon of water will renew the contents of the 6-in. trap 1⅔, and the 4-in. trap 2⅔ times, and the more frequently the contents of a trap are renewed the cleaner and the more sanitary it will be. Again, the 4-in. trap is the less costly to provide.

AN IMAGINARY CASE.

In order to press the points I desire to emphasise a little further, let us take an imaginary town, possessing, say, 10,000 street gullies. As the average capacity of each gully is 7½ gallons, the combined contents of the above number of gullies would be 75,000 gallons.

Suppose, again, that our imaginary town contains 25,000 houses, each of which has a 6-in. gully with a capacity of 10 pints. The combined contents of the latter would be 31,000 gallons.

The total contents, therefore, of the street and sink gullies in such a town would consist of 106,000 gallons of decomposing filth, and the sewage of that town in gaining entrance to the drains and sewers would have, so to speak, to pass through a septic tank of that capacity. These gullies are not self-cleansing, so that it is practically impossible for any portion of the ordinary quantities of sewage discharged to enter the sewers in a fresh condition, and with each discharge there is carried into the sewers a quantity of decomposing sewage charged with noxious gases. Under such circumstances there is little wonder that foul odours emanate from sewers at certain times, at certain situations, and under favourable conditions.

Now suppose in this imaginary town the 10,000 street gullies were replaced with 10,000 6-in. self-cleansing traps, and 4-in. self-cleansing traps were substituted for the 25,000 sink gullies, the total capacity of both the latter would then be under 16,000 gallons. Which is likely to be the more harmful to public health, the holding-up of 106,000 gallons of decomposing sewage in miniature cesspools, or the holding up of 16,000 gallons in self-cleansing traps?

Again, as stated, it is practically impossible completely to renew the contents of the gully, whereas upon each occasion that 1 gallon of liquid is discharged through a 6-in. or a 4-in. self-cleansing trap a certain portion of fresh sewage gains access to the sewer, and as a consequence I contend that the sewers would be less foul than they are to-day.

TRAPS OR GULLIES.

Although advocating the substitution of 6-in. traps for the present street gullies, I do not pretend that such traps would not require inspection at regular intervals; and when it is considered that 10,000 to 15,000 gallons of water would suffice to change and renew the contents of 10,000 such traps, and suppose this were carried out fortnightly during dry and warm weather, would not a state of matters then exist from a sanitary point of view far preferable to that which obtains to-day? And the cost of such attention would be very much less than the cost of cleansing the present gullies.

The change here advocated would affect the work at the sewage outfall works, and no doubt this will be urged as an objection to the proposal.

The substitution of a trap for a gully could not increase the amount of sewage to be dealt with; hence there would be little or no difference in the cost as far as the tank or precipitation treatment of the sewage is concerned. There would, however, be an increased amount of sludge to be dealt with. But against that the cost of cleansing the gullies would cease.

I estimate that in the cleansing of 10,000 gullies by the scoop method, some twenty to twenty-five cartloads of sludge per week on an average would probably be removed, and, of course, the sludge at the outfall works would be augmented accordingly. The collection and disposal of gully sludge will cost from 8s. to 10s per load; or, to put it another way, the cleansing of each gully will cost from 1s. to 1s. 6d. per annum, but such cost will no doubt vary, according to local circumstances.

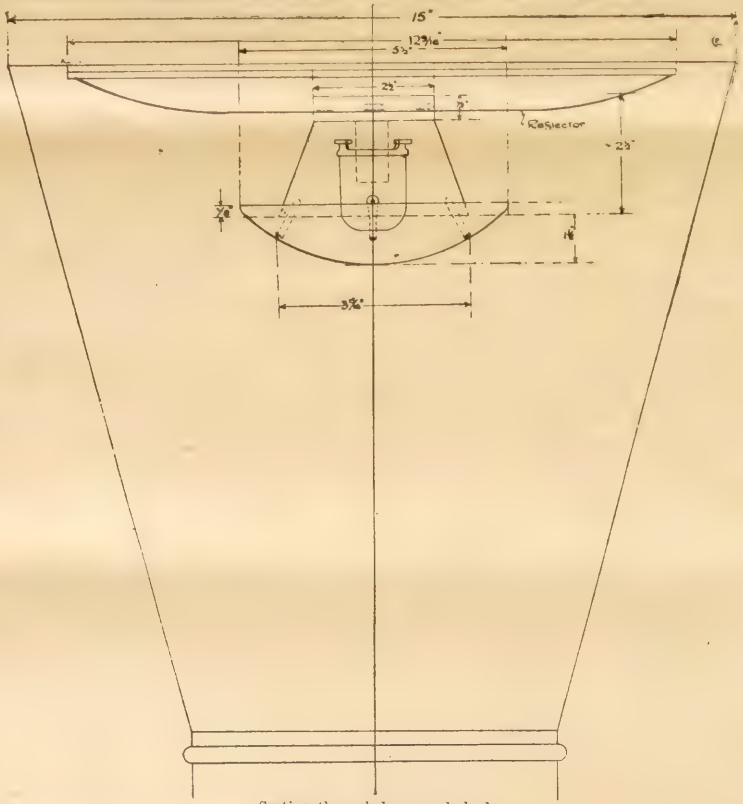
Again, under ordinary conditions, the purchase price of 10,000 gullies would be about £12,000, whereas a similar number of 6-in. traps would cost about £4,000. It seems, therefore, that the points raised are worth consideration from a sanitary, if not even from an economic standpoint also.

* Paper read at a sessional meeting of the Royal Sanitary Institute.

Sanitation in St. Germans.—At the last meeting of St. Germans, Cornwall, Rural District Council it was reported that Colonel Corkery (senior medical officer of the district) had written complaining of the water supply and sanitary condition of the village of Kingsand. The inhabitants had, he said, had no water for several days, and the whole village was in an insanitary condition. If immediate action was not taken he would take control of it as a military area, send to London for an inspection from the Local Government Board, and let all the charges be met from the rates, as he considered an epidemic might break out. The clerk said all Colonel Corkery could do was to complain to the Local Government Board that that council had failed in its duty, and if they considered that a strong case had been made out they would direct a local inquiry. Then, if they considered they ought to have provided water, &c., and had not, they could give an order for the work to be done, and if they did not do it they would appoint someone to do it at the council's expense. It did not want a colonel in the R.A.M.C. to do that. Anyone could do it; but it would take months to get water.

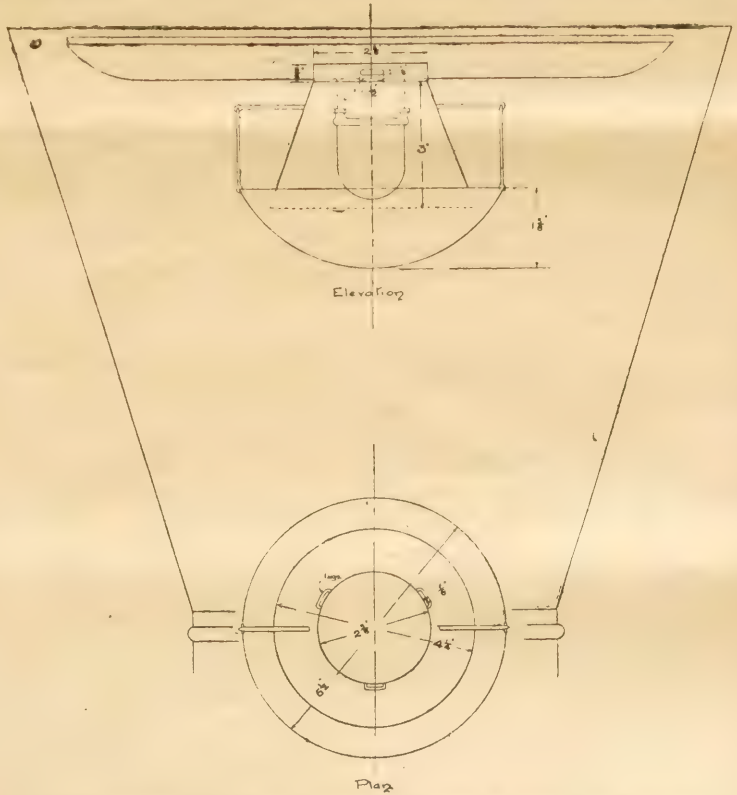
Officially-Approved Shades for Street Lamps.

The four designs for the masking of street lighting reproduced on this and succeeding pages have been forwarded to us by H.M. Office of Works. As will be seen, Nos. 1 and 2 are for use with inverted gas mantles, No. 3 for use with upright mantles, and No. 4 for use with an ordinary incandescent bulb. These designs have been approved, after test, by the authorities, and can be used without fee wherever desired. It should be noted that, where used, the dimensions should be rigidly adhered to, as any departure would violate the conditions laid down by the authorities for the use of such devices. The principle governing the design in all cases is that all light emitted is indirect, and that no light is visible at a point above the horizontal plane. The metal used is bright tin in all cases, and the construction can be of the cheapest and lightest form.



Section through lamp and shade.

(1) The device shows a plain cone with cylindrical top arranged for a bayonet fitting to suit the aperture in the ordinary street lamp, having suspended from it a circular dish. The whole is made out of bright tin. The approximate cost in large numbers would be about 6d. This pattern can be used only where a by-pass is provided.



(2) Similar to No. 1, but for such lamps where no by-pass is provided, the modification being that the bottom dish or reflector is swivelled as shown. Where this is used, some alteration of the lighting torch will be necessary. A small stud affixed at the top of the torch below the jet will be required. This stud will engage on the lower swinging portion of the device, and a pull downwards will expose the mantle to the lighting action of the torch.

MASKING DEVICE FOR STREET LAMPS, SINGLE BURNER, INVERTED GAS MANTLE.

(For designs 3 and 4 see overleaf.)

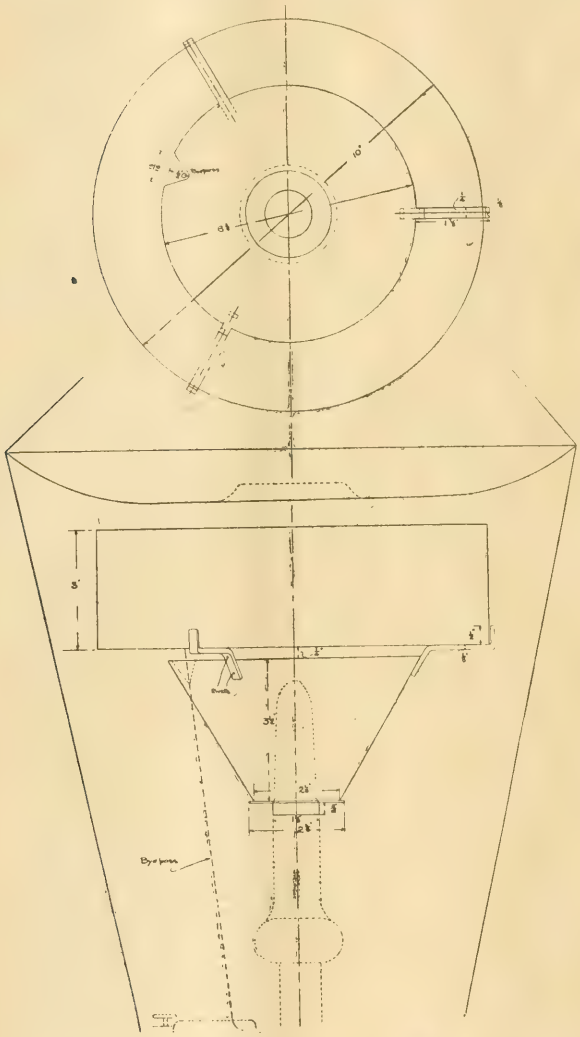
RURAL ENGINEERING.

WATER SUPPLY AND SANITATION.

By E. B. McCormick.
Office of U.S. Office of Public Roads and Rural Engineering.*

We are accustomed to think of the cool, shaded open well and the sparkling spring in some ravine as being the sources of drinking water that are far superior to any available to the city dweller. As a matter of fact the well curb may be lower than the surrounding ground, and the well may for years have been acting as a collector of germs of all kinds until even the bucket itself is lined with them. The spring may be, and many times is, merely the outlet of a drain from some field badly contaminated by sewage or other refuse, and the water from the spring may be loaded with germs, such as typhoid. A person drinking such water may, if the fortunate possessor of a strong constitution and under favourable conditions, maintain these germs within his system without fatal or even serious effects. It is a fact, however, that the per capita prevalence of typhoid and similar diseases is greater in suburban and rural communities than in the crowded cities, in spite of the slums existing in many of the latter.

In most localities in the United States it is easily possible to secure a reasonably copious supply of pure water, but the methods employed in one locality may not do in another. The constructions to be employed in securing the supply and protecting it after it is secured are, in the main, simple if adapted to the conditions. In many cases, through lack of sufficient forethought or knowledge on the subject, the source of water supply is located at the most inconvenient point on the farm, because of the belief that water can be obtained more readily there than at any other point. In many cases such location is absolutely unnecessary The engineer's knowledge may permit him to study the local information available on the subject of ground waters and locate the supply at a point which makes it most convenient to all operations of the farm.



Masking Device for Street Lamps, Upright Burners with Gas Mantles.

(3) The arrangement shown consists of a plain truncated cone with cylindrical base fitting around the lamp attachment supporting the mantle, having superimposed above it a plain circular band, 3 in. deep, supported by three light metal clips, the cone cut in one position to allow for passage of by-pass connection.

In two typical cases now, being worked out by the Office of Public Roads and Rural Engineering in adjacent localities, the conditions warrant in one case the use of a ram operated by the flow from an artesian well; in the other it has been decided that a gasolene engine and a deep-well pump will prove to be the best solution. In the one case an underground pressure tank can be used, located near the source of water supply, and furnishing water under pressure to all the buildings and feed lots; in the other case it has been about decided to use a combined system consisting of a pressure tank in the basement of the dwelling and a small storage tank located in one of the barns, and supplying two or three buildings and feed lots. The points that have been considered in determining the type of installation to be employed are the operations carried on, the contour of the ground, the location of the water supply, the location of the present buildings, which was already fixed, and the probable location of additional buildings to be erected as needs arise, not neglecting, of course, the amount of money that could reasonably be spent on the installation without raising the permanent investment beyond a point where returns might be expected.

The engineer may not stop when he has located the source of supply and arranged to protect it from contamination; his next step is to arrange for the distribution of the water to the farmhouse and the other buildings of the plant. With a knowledge of plumbing appliances and methods possessed by a competent sanitary engineer, the water supply can be carried into the house and to various parts about the farm at a comparatively low cost. With the system correctly installed, the first cost may be saved many times over in the operation of the entire plant through reduced labour and the consequent increased time for other work, to say nothing of the added convenience and pleasure to be derived from such an installation.

SEWAGE DISPOSAL.

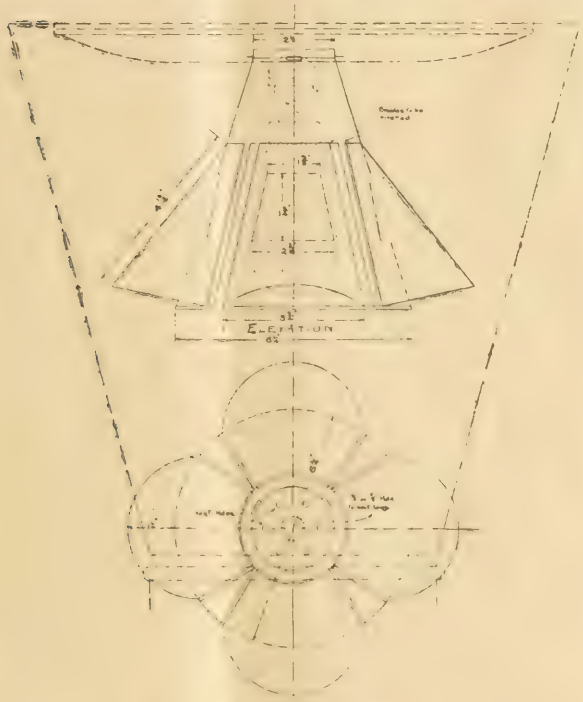
Closely connected with the problem of water supply is that of sewage disposal. Formerly it was considered that but one of two methods was available for the disposal of human excreta—that of a com-

* Extract from Year Book of United States Department of Agriculture for 1915.

municipal sewer or open privy vaults. To-day there are in use several methods lying between these two.

A vault may be used and rendered to a great extent sanitary. Cesspools under certain conditions may be advisable. A septic tank with some one of several forms of distribution and irrigation may be found to fit the needs and be within reasonable limits of expenditure.

Even more than some of the other problems of rural engineering, that of sewage disposal is one whose solution is determined to a great extent by the local conditions. An installation that has proven satisfactory in some cases has turned out to be a complete or partial failure when applied under other circumstances. In order so to design and locate a disposal plant that contamination is avoided, not only on the premises of the owner but on those of his neighbours, requires the services of a man who not only has the necessary scientific training, but who can draw from his own experience and from that of others.



PLAN LOOKING DOWN

SHADE FOR INCANDESCENT ELECTRIC BULBS.

1. The device consists of a plain cone with a closed base and cylindrical top. Top to be closed with the exception of an orifice to permit of the wires or end of the lamp-holder passing through. The cone has four irregular rectangular openings through which the light passes, but all direct rays of light are cut off by superimposed hoods, as shown in the sketch attached. In order to obtain the calculated effect, the position of lamp should in all cases be as shown in sketch.

Road Upkeep at Paignton.—Moving the adoption of the Roads Committee's report at the last meeting of the Paignton Urban District Council, Mr. Hill expressed regret that the estimates were cut down. The roads were in a very bad state, especially the country roads. The metal used was totally unfit for the roads, and if a frost was followed by a heavy thaw, the roads would be in a terrible state. There were 73 miles of country road, and they had only £750 to spend on them.

Torquay Pavilion Finances.—The Torquay Entertainment Committee report a net loss on the pavilion, café and gardens for ten months of £2,777, against £3,501 last year. It is understood that a supplementary report showed that the committee had received two offers, which were regarded as highly substantial, to lease the pavilion, and therefore it was deemed that there was no need at present for the consideration of a proposal for the temporary closing of the building.

PLANNING OF MUNITION WORKERS' HOUSES.

A LOCAL AUTHORITY'S PROTEST.

At the last meeting of the Hawarden Rural District Council the Health Committee reported a communication from the Ministry of Munitions stating that they proposed to erect forty houses in the neighbourhood of Mancott to accommodate their firemen and policemen.

It was agreed to take a census in that district to ascertain how many of the numerous men in lodgings there were in direct employment of the Government or in the employment of their contractors. It was stated that houses erected in the district for the accommodation of Government employees had no means of access to the backs.

Mr. Moulsdale and Mr. John Jones complained of neglect to comply with the council's by-laws in the erection of these houses.

Mr. Moulsdale said the Local Government Board held the council to their by-laws, and he thought the Government ought to set an example to others in such matters.

The surveyor pointed out that these buildings were exempt from the council's by-laws. They were buildings authorised by one of his Majesty's principal Secretaries of State, and as such the builders were not bound to submit plans to the council.

Mr. T. Rowland said that might be so, but the Local Government Board approved of their by-laws, and they ought to adhere to the by-laws themselves. Every working man who built a house had to adhere to the by-laws, but the Government, or their representatives, just took the bull by the horns and did as they liked.

Captain Phillips said it seemed that the Government could build as they liked, and ignore the local authority.

The Rev. J. J. Robinson also objected to the council being ridden over in such a roughshod manner by the Government. He suggested the passing of a resolution of protest to the Government.

The clerk advised that the resolution should be toned down a bit, because any building in his Majesty's possession, or employed, or intended for his Majesty's use or service was expressly exempt from the by-laws. He would rather address to the Local Government Board a communication pointing out that the council were responsible for the health of the district, even if it was injuriously affected by Government buildings, and would be called upon to provide sewers for those buildings if necessary, and that they were obliged to enforce the by-laws upon private individuals, however poor they might be.

It was decided to leave the matter in the hands of the clerk.

Johannesburg Swimming Bath and Wash-houses Scheme. A scheme for the provision of a swimming bath and wash-houses in Newtown, Johannesburg, is referred to in the report of Mr. G. S. Burt Andrews, the town engineer, for the year ended June 30th last. The wash-houses will have accommodation for thirty users, and each person will be provided with a special rack with quick-drying apparatus. A large ironing room will also be provided, as well as offices, and space will be left to allow of extensions in the future. The swimming bath will have a pool 50 ft. by 100 ft., with dressing-boxes on the ground and first floor levels, the former being for men and the latter for women. There are in all fifty-five dressing-boxes. There is also a large apartment for children's dressing purposes, with the usual offices. The estimated cost of the two buildings is £12,000.

The Extent to which Sewage can be Purified by Practicable Methods of Artificial Treatment now in Use.*

By HARRISON P. EDDY, Boston, Mass.

All of the fundamental principles of sewage disposal and treatment now available had been recognised and actually utilised twenty-five years ago. Coarse screening has been practised at Boston since 1884, and the Massachusetts Metropolitan Sewerage Commission put the Deer Island submerged outlet into use in 1895 for the purpose of furnishing adequate dilution to the coarsely screened sewage from the northern portion of the Metropolitan District. Paris and Berlin have been applying their sewage to broad irrigation farms for more than thirty years; the Welsh town Merthyr Tydvil treated its sewage by intermittent sand filtration as long ago as 1871. Sedimentation was used in England many years ago, and in 1870 chemical precipitation was well established there. Over twenty-five years ago Webster had invented an electrical method in which the suspended matter was precipitated by a process closely akin to chemical precipitation, and combining therewith, at least in principle, the killing of organisms, or disinfection.

Fig. 1.—Physical Condition of Principal Constituents of Sewage of Medium Strength (Parts per Million).

Note.—The suspended solids include all substances retained upon ordinary laboratory filter paper. "Dissolved" colloids is a term coined to apply to substances which will readily pass through the filter paper, but which are colloidal.

The fact that these principles were known and applied a generation ago is seldom recalled by those at work upon similar problems to-day. The progress of the last twenty-five years has been in acquiring a correct perspective of the problems of sewage disposal, a better understanding of the principles upon which the processes of sewage treatment are based, and in perfecting such processes and the means of applying them. Much progress has been made along these lines, and there are now a number of modifications of each of the fundamental processes in use a quarter of a century ago.

It should not be inferred from the foregoing that little real progress has been made during this time, for this is not the case. Marked improvement has been made in screens, particularly those intended for the removal of the finer suspended particles. The laws affecting sedimentation are better applied, the most radical and important changes being those due to the theories that the period of retention in tanks should be reduced to a minimum consistent with efficiency in removal of those solids capable of settling in a reasonable length of time, and that the settled solids should be promptly removed from contact with the partially clarified sewage. The greatest advance in the art has been the development of the process of bacterial oxidation by means of surface contact in bacteria beds. This process, as applied in intermittent filtration through sand, was comparatively well known twenty-five years ago, but the difficulties resulting from lack of suitable natural sand deposits led to the discovery of means of using other material, such as cinders and broken stone, by devices known as contact beds and trickling filters. These two methods, although involving substantially the same principles as intermittent filtration, generally accomplish much different results, and have proved to be substantial aids in the solution of the sewage treatment problem in many places. Disinfection has made distinct advance, and whereas it was hardly more than an experiment twenty-five years ago, its value for safeguarding water supplies and shell-fish layings has now been demonstrated.

At the present time we are just over the threshold of a newly discovered process known as the activated sludge treatment. While the fundamental principles upon which it depends may not have been fully ascertained, the information available indicates that they are substantially the same as those of the processes now used.

Composition of Sewage.

In order to consider intelligently the several available methods of sewage treatment and their relation one to another, it is necessary to obtain a clear understanding of the general ingredients of sewage.

The physical condition of the principal constituents of a hypothetical sewage of medium strength is shown in diagrammatic form by Fig. 1.* It should be noted that in this illustration there are three classes of substances—suspended, colloidal and crystalloidal. The first and second of these can be removed physically without change in composition, while crystalloids are dissolved and must be changed in chemical composition before they can be removed or altered in character. It will also be seen that 400 parts per 1,000,000 are organic and 400 parts are inorganic or mineral. The latter substances are not ordinarily capable of producing putrefactive conditions, and the problem of sewage disposal is con-

* Paper read before the Engineers' Society of Western Pennsylvania.

* *American Sewerage Practice*, vol. iii., p. 200.

cerned almost wholly with the organic matter. This is disposed as follows:—

Settling solids	100	parts
Suspended colloids	100	,,
Dissolved colloids	40	,,
Crystalloids (dissolved)	160	,,
Total	400	,,

The settling and colloidal substances, therefore, constitute 60 per cent., and the dissolved crystalloids but 40 per cent of the total organic matter.

Where sewage is deprived of its objectionable characteristics by artificial treatment, one or both of two fundamentally different processes are generally employed—first, the actual removal, or taking out of the sewage constituent parts, as, for example, such substances as paper, corks and garbage which may be removed by screens; secondly, the conversion of putrescible organic matter into stable substances. The former class of constituents is confined primarily to the suspended matter, while the latter comprises both suspended and dissolved substances.

DILUTION.

All sewage must ultimately reach natural streams or bodies of water. When the quantity of sewage is small in comparison to that of the body of water into which it is discharged, sewers are usually designed to empty their contents directly into it, without previous treatment. Under such conditions the waters are able to assimilate the organic sewage matter, a process constantly going on in Nature.

The velocity of a flowing stream may be a very important factor in the disposal of sewage by dilution, for it may thus be enabled to convey the suspended and dissolved sewage matter to a large body of water where ample dilution is afforded, in so short a period of time that the ill-effects of the admixture of sewage with even a relatively small quantity of river water may not become evident.

In general, however, the sewage matter must be changed from its natural putrescible condition, either into innocuous mineral substances or into other matters which are organic in nature, but relatively stable, so that they cannot be the cause of putrefaction. Such a change is brought about through the agency of living organisms, the most numerous and probably the most potent of which, in the majority of cases, are bacteria, although the microscopic organisms, such as various kinds of algæ, are exceedingly important factors in the cycle through which the constituents of organic matter are continuously passing in Nature's process of transforming organic matter into mineral substances and these back again into organic matter.

It may be said safely, therefore, that practically the whole process of sewage oxidation in Nature appears to depend upon the micro-organisms. In artificial treatment also practically all methods involving oxidation of organic matter appear to depend upon living organisms and their products. So it is important to bear in mind that to secure effectiveness and efficiency it is necessary to create conditions favourable to the growth and reproduction of these minute organisms. Such conditions are provided by natural agencies when the relative proportion of sewage to diluting water is small. It is necessary to adopt artificial means only when the relative quantity of sewage becomes disproportionate to the capabilities of natural waters for its oxidation. Under these conditions the first step toward artificial control may be to create a more complete distribution of the sewage through the diluting waters, thus overcoming the effect of an overload due to the concentration of the sewage in a small portion of the diluting water. The advantage of this is often overlooked.

ARTIFICIAL MEANS OF SEWAGE TREATMENT.

The objects of artificial treatment, with the methods by which they are attained, may be classified as follows:—

A. To prevent waters into which sewage is discharged from becoming offensive to the eye on account of coarse floating and suspended matter.

Screening.
- (*a*) Coarse.
- (*b*) Fine.

B. To prevent such waters from becoming malodorous.

1. Sedimentation.
   - (*a*) Rapid in grit chambers.
   - (*b*) Slow in settling basins.
     - Plain.
     - With septic action in single-storey tanks.
     - With sludge digestion in two-storey tanks.
     - With chemical precipitation.
     - With electrolysis and chemical precipitation.
     - With colloiders.
2. Aëration, contact with the organisms or sludge from previously aërated sewage, and sedimentation.
3. Contact bed treatment.
4. Trickling filter treatment.
5. Intermittent filtration.
6. Broad irrigation.

C. To prevent the introduction into the water of germs of disease.

Disinfection.

The treatment of sewage may be accomplished by a single process in some cases, but usually it is effected by a series of steps, the degree of purification increasing with each successive stage. If raw sewage may be discharged into natural waters without creating objectionable conditions other than offending the sense of sight, the simple process of screening may suffice, but if it is necessary to remove more of the matters likely to settle, sedimentation may be adopted as an adjunct to or substitute for screening. Where the diluting waters are so limited in quantity that it is necessary to supplement their powers of oxidation, some method of artificial oxidation must be adopted—such, for example, as filtration through beds of sand or stone which form the habitat of bacteria and other organisms capable of bringing about the more or less complete and rapid oxidation of the organic matter of the sewage. Under still more exacting conditions it may be necessary to go further with the removal of pathogenic organisms. The final process would then be disinfection, through which a large proportion of the harmful bacteria may be eliminated even from settled sewage. In such a case the treatment would involve four successive steps—namely, screening, sedimentation, oxidation by filtration or other means, and disinfection.

SCREENING.

Municipal sewage contains many relatively large and coarse substances such as cloth, paper, garbage and pieces of wood, which may interfere with pumping and other machinery and prove unsightly in the waters into which the sewage is discharged.

Such substances may be removed by coarse screens, which often consist simply of parallel iron bars, or gratings, set vertically or at an angle of from 30 to 60 deg. with the horizontal, through which the sewage flows and upon which the very coarsest of the suspended and floating matter is retained.

Coarse screens will remove only from 5 to 10 parts per 1,000,000 of suspended matter originally contained in the sewage. This is usually sufficient for the protection of machinery and is regarded as sufficient for all purposes in some cases where sewage is discharged into large quantities of diluting water, as into the tidal waters of Boston Harbour, off Nut Island.

If, however, sewage is to be discharged in relatively large quantities into waters used for boating and other pleasure purposes, coarse screens cannot be relied upon to remove all of the suspended matters which are recognisable as being of sewage origin, and which, therefore, may be considered as offensive to the sight. Where such substances must be removed and also where a somewhat greater reduction in the organic matter is required, fine screens may be used, either by themselves, or supplementary to the coarse screens. Numerous types of fine screens have been perfected and placed upon the market, among which may be mentioned the Weand screen, first installed at Reading, Pa.; the Jennings screen, used at the Union Stock Yards in Chicago; and the Riensch-Wurl screen, used in Germany, and being installed to a limited extent in this country. The Weand screen consists of a horizontal revolving drum covered with a fine mesh screen. The sewage is discharged into this drum at one end and flows out through the cloth, which retains the suspended matter until it is washed off into suitable receptacles by jets of water. The Jennings screen is of the moving band type, the lower end being submerged in the sewage, which flows through the screen cloth, which retains the suspended matter and carries it up out of the sewage. When

the screen has passed over the pulleys at the top, the screenings are blown off into a pit by a jet of compressed air applied to the back side of the screen. The Riensch-Wurl screen, which is typical of its class, consists of a disc of perforated metal, with or without a frustrum of a cone attached to its centre, the whole being mounted on a shaft whose inclination from the vertical determines the degree of tilting of the disc. As the screenings are raised above the surface of the sewage by the revolving disc and cone they are swept into a circular gutter, by brushes on the ends of the arms of a large spider. Where the screen is surmounted by the frustrum of a cone the side of the cone is cleaned by a brush inclined against its surface.

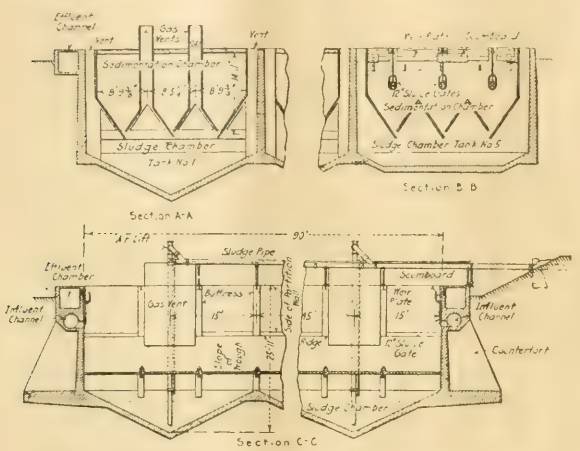

Fig. 2.—Sections of Imhoff Tank at Fitchburg, Mass.*

The quantity of suspended matter removed by fine screens varies with their efficiency and the quality of the sewage. Such screens may remove from 20 to 70 parts, averaging perhaps 50 parts per 1,000,000 of suspended solids.

SEDIMENTATION.

It has been claimed sometimes that with the most effective fine screens the organic matter may be removed to such an extent as to greatly reduce the oxygen requirements of the sewage, and thus make it possible to dispose of a much greater quantity of screened than of raw sewage in a given quantity of diluting water. The consensus of opinion, however, appears to be that, while the reduction of organic matter by fine screenings may be considerable, it will not be enough to greatly increase the quantity of sewage which a given stream or body of water may receive and remain in a satisfactory condition. Grounds for this opinion will be apparent when it is considered that much of the coarse suspended matter in sewage consists of materials like paper, matches and coffee-grounds, which are relatively stable organic substances and which do not constitute so great a tax upon the diluting power of the water as equal quantities of fæcal and other polluting substances which are more finely divided and consequently which are not so completely removed by screens. Therefore, where it is necessary to increase the quantity of sewage which may be discharged into a body of water, sedimentation in some form is generally adopted.

Grit Chambers.—The grit chamber ordinarily is merely an adjunct to the main process of sewage treatment, its function being to remove the coarser sand and gravel commonly called grit, which might cause excessive wear of moving parts of machinery, or cause deposits in tanks or elsewhere which would prove more expensive to remove from such tanks than from grit chambers. There is much diversity in the design of such chambers, the older ones and those most commonly in use in England being so large that they permit the sedimentation not only of the grit or mineral matter, but also of much of the organic sewage matter. Such deposits are relatively large in quantity and exceedingly offensive in character. They are removed by manual labour, being shovelled, after draining, into buckets, or they may be dredged by various types of excavators capable of removing the grit from beneath the surface of the sewage, thus avoiding the emptying of the chambers. The more modern type of grit chamber, which may fairly be said to have originated in Germany, consists of one or more narrow channels, through which the sewage is allowed to flow at velocities closely approximating 1 ft. per sec., at which the sand and gritty matter will deposit. These chambers are in turn shut off and drained, and the grit removed, ordinarily by manual labour. Under the best conditions this grit consists of a mixture of various sizes of sand, comparatively little of which is finer than ordinary mortar sand. It contains relatively little organic matter, perhaps from 15 to 25 per cent, and is less offensive than the grit removed from the larger and older type of chambers, where the velocity of flow is much lower. The quantity of grit removed will vary roughly between 10 and 40 parts per 1,000,000.

Plain Sedimentation.—Plain sedimentation may be assumed to mean the process by which sewage is allowed to flow through horizontal or vertical tanks at velocities sufficiently low to permit substantially all of the suspended matter capable of settling in a reasonable length of time to fall to the bottom of the tank, where it accumulates in the form of mud, commonly called sludge.

It is necessary to remove this accumulation from time to time, and it may be said in a general way that a plain sedimentation tank should be cleaned at intervals of from three to six weeks, depending upon the season of the year, or, more accurately, the temperature of the sewage. The object is to remove the sludge before decomposition becomes very active and causes portions of it to rise through the sewage, form a well-defined scum, or pass out of the tank in the effluent.

Septic Tank Treatment.—The septic tank, a patented device, is similar to the plain sedimentation tank; in fact, there is scarcely any difference between the two, except in the method of operation. The septic tank is distinguished by being so operated as to ensure the absence of dissolved oxygen in the effluent and to permit of more or less complete decomposition of the solid substances in the sludge. This decomposition is accompanied by the production of large quantities of gas, due to biological action, and the gases are retained until the mass becomes sufficiently buoyant to rise rapidly to the surface, sometimes giving to the tank the appearance of ebullition. With these gases also rise large quantities of suspended matter, much of which is relatively coarse, especially if the sewage has not been screened, or has been screened only through coarse racks. This suspended matter holds entrained the gases, which in turn cause it to float at the surface of the tank. Repeated ebullitions of this kind cause the gradual accumulation of greater and greater quantities of this floating coarse

suspended matter, which ultimately forms a thick scum attaining in some cases a thickness of 2 ft. or more.

The septic tank, which at one time was looked upon with favour by some engineers, did not prove as satisfactory as was originally anticipated. The continuous evolution of gas from the sludge causes large quantities of suspended matter to be continually rising and falling through the liquid in the tank, which carries much of it out of the tank, thus defeating in part the object of the process. Furthermore, the changes due to aërobic decomposition of organic matter appear to render the sewage rather more difficult to treat by processes of oxidation than fresh sewage which has not become impregnated with the gases and other products of decomposition. Septic sewage also frequently possesses an exceedingly offensive odour.

Two-storey Tanks.—A recognition of the defects in the septic process led to the construction of two types of two-storey tanks—one, by Dr. William O. Travis, of Hampton, England, and another by Dr. Karl Imhoff, of Essen, Germany. The theory upon which these types of tank are based is that the sewage should be allowed to pass through the sedimentation chamber as rapidly as is compatible with the practically complete removal of the suspended matter capable of settling in a reasonable length of time, and that the sludge should be permitted and encouraged to decompose in a chamber separate and distinct from that in which the sedimentation process is going on. The result of this plan is an effluent deprived of its suspended matter, and which has not come in contact with the decomposing sludge, and therefore does not contain the gases and other products of decomposition, nor the finely-divided suspended matter so prevalent in effluents from the septic tank. In fact, where sewage is rather dilute and the temperature is moderate the effluent from such tanks frequently contains dissolved oxygen. Sections of the Imhoff tank are shown in Fig. 2.

Work Performed by Sedimentation.—It may be assumed that of the 150 parts suspended solids capable of settling in two hours, perhaps 130 parts can be removed by efficient plain sedimentation. This is based on a tank efficiency of about 90 per cent, computed upon the removal of settling solids. Upon this assumption the effluent will contain suspended colloidal matter which, together with the remaining settling solids, will amount to about 170 parts per 1,000,000. In addition the effluent will contain about 500 parts of dissolved solids, of which about 50 parts has been classified as dissolved colloidal matter, 40 per cent of which may be assumed to be organic.

Chemical Precipitation.—If further improvement is desired a part of the remaining settling solids, suspended colloidal solids and dissolved colloidal substances may be removed. To accomplish this recourse was had many years ago to chemical precipitation. This consists of adding to the sewage certain chemicals like lime and sulphate of iron, which react upon each other in such a manner as to form a flocculent precipitate, which gathers in large flocculi which enclose and attract the finely-divided suspended matter and some dissolved colloidal matter, and by their weight carry these substances to the bottom. In this way it is possible to greatly reduce the suspended solids and to effect some reduction in the so-called dissolved matter. This method has been subject to much objection on account of cost, the difficulty of disposing of the large quantity of sludge produced and of the partial removal only of the organic matter contained in the original sewage. Chemical precipitation is generally utilised by itself, although in some cases, particularly in the treatment of industrial wastes, it may be introduced as an adjunct to and following plain sedimentation, and it may be used as a treatment preliminary to some method of filtration.

Sedimentation with Aëration.—The most recent development in the art of removing suspended and colloidal substances from sewage is that known as the "activated sludge process." By this means it is possible to remove from ordinary municipal sewage a large part of the suspended and colloidal matter. As yet the installations are experimental, but are giving promising results. Suspended solids may be removed almost completely in the remarkably short time of four hours, or even less. This process will be described in succeeding pages.

Work Performed by Sedimentation aided by Methods of Removing Colloids.—It has been pointed out that the effluent from efficient plain sedimentation will contain about 170 parts per 1,000,000 of settling and suspended colloidal matter, and about 50 parts of so-called dissolved colloidal matter, making a total of 220 parts per 1,000,000.

Several ways of removing a portion or the whole of this matter have been suggested, among which may be mentioned sedimentation in tanks equipped with many vertical slats, or colloiders, chemical precipitation and the activated sludge treatment. The last method will accomplish more than is practicable under ordinary working conditions by either of the others, and in addition it will at the same time oxidise some of the dissolved substances; therefore it cannot fairly be considered as simply a means of removing suspended and colloidal matter.

The most effective method devoted strictly to the removal of such substances is chemical precipitation, by which much of the settling solids and colloidal matter can be removed. In addition to the 130 parts of settling solids which may be removed by plain sedimentation, about 160 parts of the settling solids and colloidal matter which escapes this process can be removed by chemical precipitation, leaving in the effluent from this process 60 parts per 1,000,000, or less, of settling and colloidal matters. It is possible to go even further, but the cost of doing so has usually been prohibitive.

The effluent from sedimentation tanks may be discharged with propriety into some bodies of diluting water, but in many cases it is necessary to carry the process of purification further. Where chemical precipitation will provide a suitable effluent the choice between this method and some means of oxidation will depend upon their relative costs. In many cases, however, the effluent from chemical precipitation will not be adequately purified and it will be necessary to resort to an oxidation process. The failure of various tank treatments to remove fine suspended and colloidal matter and the necessity of oxidising the organic matter of tank effluents before their discharge into natural waters, led to the development of processes for transforming this organic matter into stable substances, the demands of which for oxygen are not great enough to exhaust the supply or cause putrefaction.

CONTACT BED TREATMENT.

Perhaps the most logical step ahead from tank treatment is the application of sewage to the contact-bed. Such beds are built in water-tight compartments filled with broken stone or other similar medium to which bacteria become attached. The mass of stone is thus converted into an active bacterial medium, over which the sewage gradually flows during the filling and discharging periods, and in contact with which it remains during the contact period.

Such beds are operated in cycles, of which the following is typical: –

Time of filling	1·0 hour
Time of contact	0·75 „
Time of emptying	0·25 „
Time of resting	6·00 „
Time of cycle	8·00 hour

While the sewage is in contact with the bacterial film or jelly surrounding the stones, its colloidal and dissolved substances are attracted to these films in which the bacteria are living and digesting the organic matter thus brought to them. The changes which occur in the contact-bed apparently consist of the initial removal of suspended and colloidal matters, its partial oxidation and the oxidation of matters in solution. By this process it is possible to so change the character of the sewage that even when undiluted it will remain stable, or, in other words, will fail to putrefy, and may therefore be discharged into streams or bodies of water much smaller than those into which ordinary sedimentation tank effluent could properly be discharged. The effluent, however, is usually turbid, contains some suspended matter, and is far from being fully oxidised. This process, which has met with some favour, both in this country and abroad, usually provides for two contacts, the sewage being applied to a secondary bed after it has remained in the primary bed during the requisite period of contact. Fig. 3 shows a typical double contact bed.

(To be concluded.)

GERMANS AND CREMATION.

To the Editor of The Surveyor.

Sir,—Apropos to the Germans and cremation, mentioned in your columns, "Things One Would Like to Know," August 11th, I find on investigation that the so-called society, "Friends of Cremation," are most active. We may not agree with many practices and principles of our foe, yet we cannot overlook the fact the Germans have long been in advance of ourselves in matters of sanitation. The Germans have long been strong believers in cremation, and although incineration was prohibited in Prussia, the population of this province frequently conveyed its dead outside the prohibited area to gratify its wishes.

When I think of the thousands of dead bodies buried within a few inches of the surface of the earth in Belgium and France, I am too horrified to dwell on what the future holds for these countries. Sentiment must be put on one side; the dead bodies must be totally destroyed, and the only means is by cremation. This is a matter which cannot be inquired into or discussed at the moment, but the future holds forth a serious question which these countries will have to face. Measures will have to be undertaken to prevent a second war in their midst—an outbreak of dread disease which will destroy thousands of the population and cause greater devastation than the sword.—Yours, &c.,

Albert C. Freeman.
Author, "Cremation in Great Britain and Abroad," "Antiquity of Cremation," &c.

BRITISH AND AMERICAN MEASURES.

To the Editor of The Surveyor.

Sir,—As interesting to British engineering and commercial interests, would it not be well to remind your readers from time to time that the United States of America avoirdupois measure of 1 ton, when quoted simply as "a ton, and not specifically as "a ton of 2,240 lb.," is a ton of 2,000 lb. only?

Also that the United States gallon is a wine measure gallon, having a cubic capacity of 231 in. only, against the British cubic capacity of 277·463 in. per gallon.

In commercial affairs, when quotations are received *abroad* from a British and an American house, each quoting "per ton," or giving, say, the capacity of a pump at so many gallons, the foreigner is unconsciously (so far as he is concerned) often deceived into placing his order with the United States on account of the apparently cheaper tonnage price, or the apparently greater pumping capacity.

From wide personal knowledge obtained while touring foreign countries, the writer knows that this point deserves more consideration than it generally receives in Great Britain. Therefore, if you are in agreement as to the desirability of bringing these points to prominent notice occasionally, perhaps the publication of this letter will serve that purpose at present.—Yours, &c.,

C. T. Evennette.
London.
September 4, 1916.

THE MASKING OF STREET LAMPS.

To the Editor of The Surveyor.

Sir,—Considerable pains have been taken to obscure the light from our street lanterns, yet in every case I know of rays of light still fall on the ground beneath the lantern, which is illuminated in a manner far more readily seen by navigators of the air than any effect produced by horizontal rays.

The effect of obscuring the light from these lanterns has been to reduce their utility to that of pilot lights for the direction of traffic, an object which would be far better obtained were the lanterns rendered opaque with the exception of a disc 1½ in. in diameter in the centre of each vertical pane.

The disc would be far more apparent to traffic than the present diffused rays of light, while only horizontal rays would be emitted.—Yours, &c.,

C. H. Cooper, M.Inst.C.E.,
Engineer and Surveyor, Wimbledon.

CAUSES OF TRAMWAY RAIL CORRUGATION.

The following statement as to the causes of tramway rail corrugation, which are listed in the order of their importance, has, states *Engineering Record*, been prepared by Mr. Mason D. Pratt, chief engineer of the United Railways and Electric Company, of Baltimore. It is based on twenty-five years of experience in the manufacture of rails and the construction and maintenance of track. Mr. Pratt states that this was submitted to the chief engineers of all the larger tramway systems in the country, and that, while their individual experience varied somewhat, the conclusions were substantially agreed to by those who had given the matter careful consideration. The causes are as follows: –

(1) Self-propelled cars.—Practically all corrugation occurs on electric tramways where all or a large majority of the cars are self-propelled.

(2) Girder or other rails having considerable vertical stiffness.

(3) Soft steel for rails.—The extent and depth of corrugation is in inverse ratio to the content of carbon and other hardening elements.

(4) Single type of cars in operation, particularly double-truck, four-motor equipment.—On tracks over which there is regularly operated a service of mixed types of cars, corrugation may appear from time to time, but unless some other feature (as for instance No. 3) is the cause, the corrugation will usually "iron out."

(5) Contour of rail head.—Flat-headed rails, or those on which the wheels have only a narrow or partial bearing, will develop corrugations earlier than those on which the wheels have a full bearing (as on convex-head rails).

(6) Heavy mill scale on the rails. On rails that have been rolled under conditions producing heavy mill scale that is allowed to go through the finishing pass, the surface of the rails has been so heavily marked as to start corrugation immediately after the rails have been put in service. Mr. Pratt has inserted the following clauses in his specifications for rails for the last two years, and this has had a beneficial effect: –

"In the rolling process such precaution shall be taken as may be necessary to entirely remove mill scale just prior to rails entering last two finishing passes and otherwise to produce a finished bar having smooth, regular and true surface on head and in finishing contact areas.

"Any rails showing by the closest possible inspection the slightest indication of corrugation will be rejected."

Other causes are: (7) Rapid acceleration and deceleration. (8) Unequal diameter of wheels on same axle. (9) Long radius curves. (10) Intensity of wheel loads. (11) Track foundation. (12) Segregation of steel. (13) Track sanding. (14) Grades.

Sewage Disposal and Water Supply in Canada.

RÉSUMÉ OF TREATMENT PROCESSES.*

The question of stream pollution is becoming very serious in Canada. As proof of this, investigation has shown that 183 municipalities in Canada dispose of their sewage in raw, untreated form, by discharging directly into inland water. This figure means about 66 per cent of the places that have any sewerage system at all. From most of these waters other communities draw their water supply, placing their intakes below the discharge outlet for sewage. It has been found that 40 per cent of the waterworks plants in Canada draw their supplies from sources that are possibly polluted. This indicates the extent to which the practice of stream pollution has developed, and the danger to which people are subjected through improper handling of sewage. The methods of sewage disposal and water supply are thus intimately related. In many instances municipalities have utterly disregarded the welfare of other places in the matter of discharging putrescible sewage into a source of water supply.

MORE INTEREST BEING SHOWN.

That this matter is receiving more of its due attention is evidenced by the increasing interest shown in this connection. Expenditures have been authorised for the construction of sewer systems and sewage purification works, and many plans are being prepared for more or less comprehensive lay-outs. All over Canada a greater realisation is being felt that a sanitary method of gathering and disposing of sewage waste is of paramount importance from a health standpoint alone.

On the other hand conditions may be such that a combination of methods may be advisable. The problem for the engineer is, then, to determine to what extent purification must be perfected and to design a method that will most effectually carry this out.

In the entire country only 279 communities have any method by which they remove their sewage. This is remarkably small in comparison with the total number of towns in Canada, due, no doubt, in part to the heavy expenditure which the construction of sewage systems involves. The capital lay-out necessitated is, in general, greater than smaller places care to spend.

In some places the method in use is to employ one set of sewers to carry domestic sewage, street drainage and storm overflow. In others separate systems are installed. One hundred and fifty-five towns employ the combined method, while separation is carried out in 124 places. By provinces the number of sewer systems is as follows: Nova Scotia, 20; Prince Edward Island, 2; New Brunswick, 10; Quebec, 98; Ontario, 95; Manitoba, 9; Saskatchewan, 15; Alberta, 14; British Columbia, 16.

The total length of pipe included in these systems is 4,223 miles.

Sewage treatment, with the object of rendering the effluent harmless and free from disease-spreading bacteria is carried out in only 75 cases, representing 36·3 per cent of all the municipalities which possess sewerage systems. The three maritime provinces have no purification systems at all, sewage in these cases being discharged directly into rivers or bays. The Western provinces show the greatest proportion of treated sewage works. In Saskatchewan, 80 per cent of all systems are treated; in Alberta, 43 per cent; in British Columbia, 44 per cent. In Ontario, about one-third of the towns purify their sewage, and approximately one-eighth in Quebec.

SEWER PIPES.

Sewage systems show no great variation as regards their distribution pipes. Tile pipes are the accepted standard for all small and many large installations. In the larger towns, where the size of the pipe-lines is sufficient to warrant it, brick and, to a lesser extent, concrete are freely employed as materials for sewer construction. Cast-iron and steel occur in rare instances. Wooden sewers have been installed in four or five towns. St. John, N.B., possesses 11¼ miles of this type in various sizes, and Winnipeg has 1¼ miles, while other places have lesser amounts.

Plants for the treatment and purification of sewage wastes show more variation in design and manner of operation, and very many systems have been evolved to carry out purification effectively. Local conditions, as well as initial cost, govern to a large extent the particular type which any town will select, and the degree of purification desired will determine the extensiveness of the system.

In the towns and cities in Canada which employ methods of treatment illustrations are afforded of practically every well-known process, from the simplest to the more extravagant. In many cases, where conditions warrant, a combination of systems is made use of, purification increasing with each step.

STERILISATION.

Two or three municipalities merely render their sewage sterile by means of chemical treatment with hypochlorite of lime. This is simply a disinfecting process, and does not aim at separating the solid materials from the liquids. The number of organisms is reduced to such an extent, however, that the discharge is not of exceptional danger. Bleaching powder is also used to sterilise the effluent from other purification processes, in this way rendering it non-putrescible, so that it can be safely discharged into a stream which is the source of water supply for another community.

Sedimentation methods are very often employed in Canadian towns. Chemical precipitation is sometimes made use of.

SEPTIC TANKS.

Septic tanks in some form or another are particularly popular. Of the seventy-five purification installations in Canada, forty employ this arrangement, either in conjunction with further processes or alone.

The Imhoff tank, used in several instances in Canada, is an improved septic tank, in which the sewage is allowed to pass through the sedimentation chamber as rapidly as the suspended matter can settle. The sludge decomposes in a chamber separate from that in which sedimentation takes place. This results in an effluent which has not come in contact with the decomposing sludge, and which does not hold the suspended matter common to effluents of the septic tank. Tanks of this nature are ideal for small communities, and their popularity is evidence of effectiveness for the purpose.

In eighteen cases extra treatment is involved, either in conjunction with or supplementary to the septic tank purification. In a number of instances the effluent is subjected to filtration to render it sterile. In others chloride of lime is used to accomplish disinfection. Very many of the towns have a combination of the septic tank arrangement, with filter beds of various types, as described below.

Examination of all of Canada's disposal systems shows that the septic tank exceeds all others in popularity. A large proportion of Western towns, in particular, are installing very modern and efficient methods.

WATER SUPPLY.

An increasing number of urban and rural centres of Canada are recognising the urgent necessity of a purer and more adequate water supply. This is due, no doubt, in part, to the rapid growth of large centres of population, coupled with the ever-increasing difficulty of keeping the sources of supply free from pollution.

That the municipalities of the Dominion are realising their duty to the public cannot be shown better than by the large money expenditures that are being made for this purpose at various points throughout the country.

Up to the end of 1914 approximately 523 municipalities had installed waterworks plants of one kind or another. Of this number 93 are treated, or 17·6 per cent.

It is interesting to note how these waterworks plants are distributed: Nova Scotia has 33; Prince Edward Island 3; New Brunswick, 20; Quebec, 177; Ontario, 166; Manitoba, 13; Saskatchewan, 30; Alberta, 33; British Columbia, 53. From springs or wells there are 206 municipalities supplied; from distant lakes or streams, 106; and from lakes or streams which are possibly polluted from one source or another, 216. Evidently, then, Canada should have at least 216 water purification systems, instead of ninety-three.

Of the ninety-three water purification plants, seventy-two use some form of filter and the remaining

* From the Toronto *Contract Record*.

twenty-one use hypochlorite of calcium. There is one exception—Longueuil, Quebec—where calcium hyposulphite is substituted. There are also a small number of municipalities where sedimentation or settling tanks or basins are in use—some as the only means of purification, others merely as auxiliaries to further purification methods.

Some of these sedimentation basins are natural reservoirs utilised at little expense. Others are rectangular basins with horizontal walls, varying in depth and size, depending on the condition of the water and the quantity demand. Where it can be had at small expense, a settling basin is generally considered a valuable adjunct of any purification system.

FILTERS.

The Canadian filtration systems include everything from a natural sand and gravel "soakage" to the most modern mechanical or rapid filtration system. At Claresholm, Alta., for example, is a good example of the former, where the water is drawn through a gravel bed and taken out at a point 150 ft. distant from the river. At Pincher Creek, Alta., the water also is drawn through the gravel bank of a creek. In Redcliff, Alta., the water passes through 2,000 ft. of gravel. At Red Deer, Alta., the wells from which the water is pumped are provided with cinder filter-walls.

A considerable number of municipalities also combine some form of chemical treatment with their filtration, the particular chemical used depending on the condition of the water. Most frequently the water is first treated with chloride of lime; aluminium sulphate and ferrous sulphate are also used. In St. Catharines, Ont., the method of purification consists of a sedimentation basin, supplemented by treatment with chlorine in the liquid form.

BUILDING WORK IN JOHANNESBURG.

By G. S. Burt Andrews, M.Inst.C.E., M.I.Mech.E., Town Engineer.

[Extract from report for year ended June 30, 1915.]

Soon after the year under review began, the outbreak of the great war in Europe caused an immediate stoppage of many projected works and a cessation of the preparation of any new schemes. The consequence of this disturbance resulted in such a decrease in building that the returns touched a lower point than at any period since the resumption of activity after the Peace of Vereeniging in 1902. The monthly decrease indicated amounted to fully 75 per cent—*i.e.*, only about one-quarter the usual amount of work was being executed.

This continued for several months—till the effect of the victory of the Marne, the suppression of the South African Rebellion and the success of the campaign in South-West Africa caused a revival of confidence. Since then there has been a gradual recovery towards normal conditions, and at the close of the year the usual amount of work had practically again been reached.

Although the progress of the town has been disturbed, as indicated, by the great European War, there is still a good deal of growth noticeable, and the commercial and industrial centres in East Market-street and Newtown have continued to show activity, and some new buildings have been erected. Dwellings are still being erected in large numbers, the total during the year being 458.

The tendency has been to open up new districts in outlying parts, with a consequent depreciation of districts near the town. This number of dwellings is only half of that put up during the previous year, and is entirely due to the great war. The houses are more comfortable and better fitted up than during the previous periods, it now being the exception not to have hot water and electric light. There is a large indication that the succeeding year will show considerable improvement on the year just passed, as it is known that the conservative dealings with loans on buildings has been bearing the building market by the comparative stoppage of advances.

Non-combatants for Road Making.—From H.M. prison, Lewes, forty-one non-combatants were released last Friday and sent to Newhaven for road making.

Steam Haulage.—The Metropolitan Asylums Board have bought a road train, comprising steam tractor and three 6-ton trailers, so that it can do its own haulage from railways to asylums.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Is it not to be hoped that the important committee which has recently been formed to investigate the question of the action of sea water on cast-iron will lead to some definite results with regard to this rather obscure matter? Was it not a wise decision to fix Brighton as the place for these investigations instead of Liverpool, where hitherto certain investigations have been conducted, but where the investigators were somewhat handicapped by having to cart the sea-water in tanks for a considerable distance?

* * * *

When will the question of the waste of water that is always going on be seriously considered and arrested? Do we not read that in nearly every city and town in the country complaints are general as to the huge quantity of water that is daily passed through the service mains? Has it not been proved over and over again that a daily supply equal to 25 gallons a head of population is more than sufficient, and is it not much to be regretted—particularly at the present time—that greater care is not exercised in the use of this costly product?

* * * *

Could not the excellent example of the Surrey Council in placing seats by the sides of some of the public roads be followed by other authorities, especially now that there are in our midst so many wounded soldiers who cannot walk far without a rest? Would some ridiculous red-tape department surcharge an authority which spent money in this direction?

* * * *

Are there existing any statistics or records which confirm the statement which is now somewhat generally accepted that tar-dressing the surface of a road adds exactly 33⅓ per cent to its life? Does this refer to an ordinary water-bound macadam road, or to a bituminous-bound road, or to both? If this is an established fact, should not the practice of tar-dressing become universal on the score of economy?

* * * *

Is not the sixth annual report of the Road Board extremely interesting reading, especially the Appendix 15, which is a report by the engineers to the board of the trials of certain road materials on the "road machine" which was installed there some years ago? Although it may be a little disappointing to find that only "carpets" were tried, are not the results of four trials of different mixtures given on Table I. in that report of considerable significance, especially when one of the "samples" stood a test equal to 458,200 tons per yard width before reaching the point when "excessive vibration" was reached, whereas another sample almost of the same construction, except that the "filler" was blue lias lime instead of Portland cement, only reached 25,960 tons before excessive vibration was reached? Would it not have been useful if an additional column to the table could have given the approximate cost of each material per square yard?

* * * *

Is it not evident that pressure filters will take the place of gravity sand filters in many new and existing water schemes? Have not the improvements and additions lately made to these mechanical filters rendered them capable of dealing with organically polluted water quite as efficiently as they formerly dealt with discoloration and inorganic impurities? But, like most other sanitary "fittings," do they not always require intelligent supervision and care? Has not the Local Government Board's withdrawal of some of the restrictions formerly placed on these filters removed some of the obstacles to their installation?

* * * *

Did the tests which were recently carried out at the Massachusetts Institute of Technology with regard to the resistance to traction of different classes of road surfaces add much to our present knowledge? Did not these experiments show that for non-resistance to vehicles with solid tyres the following was the order: Asphalt, wood blocks, brick paving, tar-macadam, ordinary water-bound macadam, heavily oiled macadam, granite setts? Is it not possible that some of these results might have shown a different order of merit if pneumatic-tyred wheels had been employed, especially as regards granite setts?

Law Notes.

Edited by J. B. REIGNIER CONDER, Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of The Surveyor, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in* black *ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.*

Substitution of Water-closet for Pail-closet: Work Done by Local Authority: Damage to Premises Liability.—An important point in connection with the subject of the substitution of water-closets for pail-closets was decided by the Court of Appeal in *Place* v. *Rawtenstall Corporation*. This was an action to recover damages awarded to the plaintiff by an arbitrator for injury to his house. The facts were as follows: The corporation served notice on the plaintiff requiring him to convert his pail-closet into a water-closet, and connect the same with a sewer, within twenty-eight days. The notice not being complied with, the corporation proceeded to carry out the work themselves. For this purpose they constructed a joint sewer to carry away the sewage from the plaintiff's house and several other buildings, at a total cost of £54, of which the plaintiff's share was £11. He refused payment, on the ground that in the carrying out of the work his house had been injuriously affected by subsidence, for which he claimed damages. The matter was referred to an arbitrator, who awarded the plaintiff £46 damages and £62 12s. for taxed costs. The corporation, however, denied liability under sec. 257 of the Rawtenstall Corporation Act, 1907, which provides as follows: "Whenever the corporation, or the surveyor, under this Act, or any general or local Act, or any by-law for the time being in force within the borough, execute, or execute or alter any work, or do any act or thing in default or at the request of the owner, occupier, or other person required to do such work, act or thing, the corporation shall not, as between themselves and such owner, occupier, or other person, in the absence of negligence on the part of the corporation or the surveyor, or of any contractor, or other person employed by them or him, be liable to pay any damages, costs, charges or expenses for or in respect of, or consequent upon the executing . . . of such work . . . and any such damages . . . paid by the corporation . . . shall be part of the expenses payable by such owner, occupier, or other person, and shall be recoverable accordingly." Mr. Justice Ridley gave judgment for the plaintiff, and the corporation's appeal from his decision was dismissed with costs. Mr. Justice Scrutton, in delivering judgment in the Court of Appeal, said that inasmuch as sec. 257 took away the ordinary right of the owner to be paid for damage to his premises by work done by another, it must be construed strictly against the corporation, in favour of the person whose common law right was taken away. The pipe which had been laid along the plaintiff's passage was sufficient to conduct the sewage or rain water of eight or nine houses. It was not therefore, in the words of the section, work in respect of which the plaintiff was "in default," and the damage did not result from the failure to perform "such work" by the plaintiff, as that work was defined by the notice. It was correct, no doubt, to say that it *included* the work which the plaintiff should have done, but it also included much more, and there was no finding that the damage caused was caused solely by the work which the plaintiff had received notice to do. For these reasons it appeared that the corporation did not bring themselves within the clause intended to exempt them, in the absence of negligence, from a claim for damages arising from the fact that they had done the work which the person served with a notice had failed to do himself; and they remained therefore under the ordinary liability at common law to make good damage done to the property of another.

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as nom de plume. *The letter* X, *combinations such as* X.Y.Z., *and words such as "engineer" and "surveyor," should never be used.*

Water Main: Damage to Highway. "T. E. T." writes: The Metropolitan Water Board supply water in this district. A burst occurred recently in one of their mains in the highway, and part of the escaping water found its way under the adjoining footpath, about 8 ft. distant, and raised the concrete slabs, making the path dangerous. The Water Board sent an order to the surveyor of the urban district council to make good the roadway when they opened up to repair the burst, and to charge them with the cost, but declined to issue an order to repair the footway, stating that it was the duty of the council. I shall be glad to have your opinion on the latter point, and to know if any similar cases have been before the High Courts.

This is rather a difficult question. I do not know of any case in which a similar point has been decided, but, if it can be proved that the burst was due to negligence in the construction or repair of the main, I think the Water Board would probably be held liable.

Building By-laws Roof. "Domus" writes: The owner of a dwelling-house in this district, which was constructed before the urban district was constituted, and at a time when there were no building by-laws in force in this district, proposes to remove the slates from the roof of the house, and substitute patent roofing material which I consider is not strictly incombustible, and would therefore not be in accordance with the present building by-laws. Can you inform me whether my council have any power to prohibit the use of this unsatisfactory material on houses which were constructed prior to the confirmation of any building by-laws for this district?

I do not think the council have any such power, except in a case in which the alterations to the building are so extensive as to constitute the erection of a "new building" within the meaning of the by-laws.

Tar-Spraying.—"W. J." writes: Most of the principal roads in this district have been tar-sprayed some weeks ago, the tar being thoroughly soaked in. The basalt chipping put on at the time is worn down, and the roads have now a good smooth surface. Do you think that the council would be liable for damages arising from a horse slipping down on the smooth surface in dry or wet weather, and whether negligence could be proved against the council by the absence of sanding and gritting this smooth surface from time to time?

Assuming that the work was properly carried out, and the surface made reasonably safe for traffic either in dry or wet weather, I do not think that the council would, in ordinary circumstances, be liable for damages arising from a horse slipping. But in the event of special weather conditions rendering the surface less safe than usual, I think it would be a wise precaution to sand or grit the roads, as the omission to do so at such times might possibly be construed as evidence of negligence.

Erratum. In reply to query by "H. C.," p. 149 *ante*, line 5, for "section" *read* "erection."

We have to draw the attention of querists to the directions laid down for their guidance in regard to the preparation of diagrams. Rough sketches obviously cannot be made use of, and we should be obliged if correspondents would therefore send only carefully-prepared drawings, preferably about 6 in. in width, and without colouring or wash of any description. Failure to observe these rules will involve the risk of queries remaining unanswered.

Dampness in House Walls.—When the interior of a house wall is discoloured through dampness the trouble may possibly spread and cause much expense. Instances are known where the plaster and the woodwork have perished through humidity. We hear that a house in Leicester which previously was exceedingly damp, was rough-casted with Pudloed cement two years ago. The architect and his client both expressed their satisfaction with the change that has taken place, and the makers of Pudlo inform us that they can refer to several hundred similar cases.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars have reached us during the present week. Other reports will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Brighouse T.C.—It is proposed to build a new coal store at an estimated cost of £2,500.

Chertsey R.D.C.—The engine-house extensions at Byfleet sewage disposal works have been completed at a cost of £741, less than the estimated cost by £28.

Manchester T.C.—Plans have been approved for the enlargement of the transformer house at the Stuart-road electricity works.

HOUSING AND TOWN PLANNING.

Weardale R.D.C.—The county council have advised the rural council to prepare a scheme for workmen's houses.

MOTOR TRANSPORT.

Acton U.D.C.—The council have purchased a new motor fire engine.

Flaxton R.D.C.—At the next meeting of the council the surveyor, Mr. J. W. Lupton, will submit a further report on the cost of steam haulage by motor tractor and tipping wagons.

Glasgow T.C.—It has been agreed to purchase two 5-ton battery-equipped wagons, at a cost of £2,990, one each from Edison Accumulators, Limited, and the General Vehicle Company, Limited.

REFUSE COLLECTION AND DISPOSAL.

Nottingham T.C.—The council are recommended by the Health Committee to apply to the Local Government Board for sanction to the raising of a sum of £6,201 for the purchase of additional land for the purposes of a refuse depot at Radford.

ROADS AND MATERIALS.

Aberdeenshire C.C.—The Turriff District Committee have agreed to an estimate of £4,025 for the upkeep of the roads, being the same as last year. Last year £2,122 was expended on the roads, or £2,388, including expenditure on tools and steam plant, and there was a balance on hand of £1,375.—The Deeside District Committee have invited the wood merchants and the local landowners to a conference on the damage done to roads by timber haulage.

Barnard Castle U.D.C.—The council are considering the representations of the county council with respect to the improvement of the main roads in the rural district.

Belfast T.C.—The arbitrator in the matter of the acquisition of ground for widening Halliday's-road and New Lodge-road has fixed the amount of compensation to be awarded at £235.

Belper U.D.C.—The tender of Messrs. W. Weeks & Son, at £56, has been accepted for the supply of a tar-sprayer.

Buckfastleigh U.D.C.—The surveyor, Mr. L. M. Williams, reports having completed 13,566 yds. of tar-spraying, at a cost of 1·04d. per yard super.

Chelmsford T.C.—The Local Government Board have sanctioned a proposal to defray out of the unexpended balance of the housing scheme loan the cost of making up stone footpaths between the council's blocks of houses.

Dumbartonshire C.C.—Plans and estimates have been submitted to the Western District Committee of the proposed improvement on the Gareloch and Loch Long road between French Riggs and Morelaggan. The cost, including engineering and inspection, was estimated at £6,500. The plans had been drawn up with the view of their being forwarded to the Road Board so that a grant may be received for the proposed work as soon as circumstances permit. The plans were approved. The road surveyor's annual report, specification, and estimate were submitted. The estimated expenditure to be provided is £13,672.

Eastbourne T.C.—The borough surveyor, Mr. A. E. Prescott, reports that the full scheme and estimate of the coastal road has been prepared. The expenditure in connection with the scheme will be heavy, probably £150,000. As to the advantage of a new road there could be no question. The existing road was extremely narrow, and, combined with the numerous sharp bends and corners, it was an absolute danger to users. Mr. Prescott adds: "The carrying out of this scheme would provide work for many of our men after the cessation of hostilities. I have several schemes of necessary road widenings and other public improvements already prepared to make provision for the employment of many of our men on their return, but I am most hopeful that the proposed coastal road scheme will be given preference, as we should obtain good value for the labour employed, and the results accruing would be of immense value and lasting benefit to the towns concerned."

Frome U.D.C.—The surveyor reported at the last meeting that the county surveyor had consented to the use of limestone on certain roads in the town, because he was satisfied that there was no stone of the better qualities available.

Hailsham R.D.C.—A report of the Roads Committee, presented at a meeting of the council on Wednesday, stated that the work of road tarring was within a few days of completion; 580 barrels of tar had been used, and about 16,000 sq. yds. of road surface covered. The approximate cost would be about £715. The cost of the work had been about 20 per cent per unit higher than was the experience last year, owing to the higher cost of materials and team labour, and the unfavourable weather that had prevailed. It had been found impossible to obtain extra men, and as the permanent staff of road men was reduced by three in April, it had been necessary to draw road men from distant sections to carry on the work, with the consequence that much of the ordinary work in their own sections had been left. On the other hand, the saving in wages during the five months had been considerably over £100.

Horncastle R.D.C.—Only one tender having been received for steam rolling for seventy days—viz., the Eddison Steam Rolling Company, Limited, at 20s. 11d. per day—it was decided to accept this subject to the firm agreeing to bear the expense when the roller is standing for wash-out purposes.

Kidderminster R.D.C.—The surveyor, Mr. G. J. Shepherd, informed the council that it was getting extraordinarily difficult to carry on the work of the district. There was a great scarcity of labour, and it was impossible to get teams to work. There would be a very much increased cost in keeping up the roads.

Milngavie T.C.—It was reported that the transfer of the control of the town roads from the county council to the town council had resulted in a considerable saving.

Newark R.D.C.—The surveyor, Mr. R. Oakden, has received instructions to confer with the engineer to the Road Board with a view to obtaining a grant for the reconstruction of the Lincoln road. The expenditure involved in the scheme is estimated at £5,000.

Newton Abbot U.D.C.—The council have approved plans for making up roads at the back of Deer Park-road and Kingskerwell-road.

West Hartlepool T.C.—With regard to the Local Government Board circular on public works after the war, Major Martin urged that the council should submit the scheme for a new road to the North, *viâ* Easington, which was under discussion prior to the war. He believed the Government would be prepared to advance large sums of money for works of that description. The town clerk promised to communicate with other authorities interested in the scheme.

SEWERAGE AND SEWAGE DISPOSAL.

Manchester T.C.—Plans have been approved of new sewerage works in Gorton-lane and Napier-street. Drainage works will also be carried out in Mosley-street.

Plymouth T.C.—The borough engineer, Mr. J. Paton, reporting to the Works Committee on the upkeep of the main drainage system, states that flood water had issued from a number of manholes recently. It was reported that, in addition to causing inconvenience, the flooding impeded the tramway traffic, and often damaged the motors of the tramcars. It was decided under the exceptional circumstances to ask the Local Government Board for sanction to borrow £1,500 for the purpose of constructing a sewer of sufficient dimensions to take off the flood water.—It was agreed to increase the wages of the sewer men engaged at the sewage works at Devonport from 24s. to 26s. per week, and that the other men at Devonport engaged on work in the sewers should be paid on the same basis as the men employed on sewer work in the Plymouth area, as follows: Leading sewer men 7½d. per hour instead of 28s. per week; other men 7d. per hour instead of 26s. per week. Applications were also received from three paviors for increase of wages, but these were declined.

Rotherham R.D.C.—The surveyor, Mr. B. Hey, reported that one of the filter beds at Swallownest sewage works had cracked, necessitating wrought-iron strips being placed round it. He had endeavoured to trace the cause, but had not been successful, as coal had not been worked anywhere near the site for thirty years. He was instructed to take what steps might be necessary for safeguarding the filter bed for the present.

WATER, GAS, AND ELECTRICITY.

Aberdeen T.C.—It was reported that the new system of lending cooking apparatus was giving great satisfaction. Prepayment meters had proved a marked success. They now numbered 14,000, and brought in £100 a day.

Altrincham U.D.C.—A report has been received of the collapse of the negotiations for the purchase by the Manchester Corporation of the North Cheshire Water Company undertaking, owing to the Hale Urban District Council objecting to a temporary rise in the charges. It will therefore become necessary for the company, in order to meet the demand for an increased supply in its area, to endeavour to raise additional capital and to purchase water from the Manchester Corporation at a much higher price than has formerly been paid for it. The Altrincham Council, in receiving the report, expressed regret at the failure of the negotiations.

Belfast T.C.—It has been agreed to replace eight mechanical stokers at the electricity station by four stokers of an improved pattern.

Branston R.D.C.—A scheme has been agreed to for a water supply to Waddington, at an estimated cost of from £1,800 to £2,000.

Daventry T.C.—The tender of Messrs. Timmins & Co., of Runcorn, at £120, has been accepted for overhauling and repairing the water-pumping plant at Dodford.

Hammersmith B.C.—The electricity undertaking is reported to be on a satisfactory basis in spite of war conditions. The surplus revenue made a further contribution of £3,450 towards the relief of the rates. No increase has been made to consumers for current supplied, and it is hoped that it will be possible to continue this policy.

Ilford U.D.C.—A deputation has been appointed to a conference of borough councils to discuss the question of linking up electricity undertakings.

Kirkcaldy T.C.—A new and important development is reported to have arisen in regard to the Kirkcaldy Corporation electricity works. Mr. Francis, burgh electrical engineer, has submitted a report on the capacity of the present works and the recent applications for a large supply of power by one of the largest and most important firms in the burgh. This the corporation cannot supply with the present installation. The Fife Power Company is willing to enter the burgh and supply the power, but is prevented by a clause in the private Act of Parliament. The town clerk in a statement observes that the company practically ask that the section referred to be abandoned by the corporation. This demand he regards as a serious matter, and he considers it clearly foreshadows the promotion by them of a Provisional Order. While he felt sure the town council would receive fair treatment from Parliament, they should take care that they, on their part, were able to show the committee that they had done all that was reasonable.

Maidenhead T.C.—The Electric Lighting Committee in reporting that the Diesel engine was now running, said that great credit was due to the staff for the work done in connection with the overhauling of the engine.

Ripon T.C.—The city council have appointed Mr. George Wilkinson, electrical engineer, to prepare the necessary plans and particulars for obtaining a Provisional Order for a scheme of electric lighting for the city.

Rotherham R.D.C.—The clerk has been instructed to apply to the Local Government Board for powers to borrow sums as follows: Bramley £275, Maltby £665, Ravenfield £102, Wickersley £328; being the amounts required in excess of the original loan of £14,889 in respect of water supply for these and other places.

MISCELLANEOUS.

Southport T.C.—The General Purposes Committee have agreed to recommend that all employees previously in receipt of the 2s. per week war bonus shall receive 3s. per week war wages—the term "war wages" being used in preference to "war bonus." These are the employees whose standing wage did not previously amount to 30s. per week. To those in receipt of 30s. and upwards the committee recommend a war wages advance of 2s. per week. The sum involved is equivalent to a 2d. rate. The committee further agreed to make an allowance to corporation workmen who have enlisted in the Voluntary Training Corps in the event of their being called up, so that they will be getting a sum equal to the extent of their ordinary wage under the corporation.

PERSONAL.

Captain Langshaw, ferries manager to the corporation of Birkenhead, has had his salary increased from £500 to £550 per annum.

Mr. J. Ennals, highways surveyor to the Lexden and Winstree Rural District Council, has been appointed plans surveyor to the council.

Mr. Joseph Hedges Barford has been appointed acting borough surveyor of Maidenhead in the absence of Mr. P. Johns on military duties.

Mr. H. D. Davies, chief electrical assistant of Stockton-on-Tees, has been appointed electrical engineer and tramways manager to the Heywood Corporation, at a salary of £200 per annum. There were about fifty applicants. Mr. Davies is thirty-five years of age, and has been at Stockton five years. For nine years previously he was at Darlington.

KILLED IN ACTION.

Private Reginald Herbert Butterfield, of the Cameron Highlanders, and eldest son of Mr. and Mrs. W. P. Butterfield, of Rose Villa, Menston, is reported to have been killed. He was in his twenty-fifth year, and prior to the war was with his father, who carries on business under the style of W. P. Butterfield, Limited, galvanising tank works, Lower Holme, Baildon. Private Butterfield, who had been at the Front about six weeks, enjoyed the high respect and esteem of a large circle of friends, who will deeply grieve to learn of his death.

A Remarkable Accident.—On Wednesday night a labourer, who was passing along the street in Hebburn-on-Tyne, placed his hand on a lamp standard, and was drawn around the standard by the electric current. When he was released he was dead.

An Official's Honorarium.—At Wednesday's meeting of Liverpool City Council, Sir Charles Petrie, referring to a decision of the Health Committee to return an honorarium received by them from an official of that committee, remarked that the official in question, whose salary was £450 a year, had agreed that any money received by him from the University or the Munitions Committee should be returned to the corporation. He had sent a cheque for £60, which was half a year's salary from these sources, to the Health Committee, and the committee had passed a resolution that the cheque be returned to him. They might have many similar cases, and they would probably have to do the same thing all round. That being so, he (Sir Charles) suggested that the Health Committee should take the matter back for further consideration. Alderman Muirhead (chairman of the Health Committee) assented to this course.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

APPLICATIONS FOR LOANS.

Bolton T.C.—£4,130 for the installation of a benzol plant, and £2,500 for the production of concentrated ammonia.

Halifax T.C.—£600 for a new water main.

Leiston U.D.C.—£1,000 for a cemetery chapel.

LOANS SANCTIONED.

Barnack R.D.C.—£224 for a water supply for Stibbington.

Battersea B.C.—£3,728 for electricity extensions.

Walthamstow U.D.C.—£9,610 for the extension of the electricity generating plant.

TRADES UNIONISTS AND HOUSING.

BIRMINGHAM CONFERENCE RESOLUTIONS.

Delegates to the Trade Union Conference which opened at Birmingham on Monday were present in considerable numbers at a National Housing Conference called by the Workmen's National Housing Council to consider the housing of the working classes.

In the course of the proceedings unanimous approval was given to the following resolution:—

"That, as it is impossible for local authorities to frame housing schemes that fulfil modern requirements, especially accommodation, that can be let at a rental within the means of wage-earners, this conference calls upon the Government to assist local authorities by contributing money from the National Exchequer equal to not less than 20 per cent of the sum sanctioned by the Local Government Board for the provision of housing schemes, and urges that not less than £20,000,000 should be set aside for housing purposes; and further demands that, in view of the reluctance of the local authorities to prepare housing schemes, the Local Government Board shall issue a special order making it compulsory on local authorities to exercise their powers under the Housing Act, so that schemes can be proceeded with immediately after the termination of the war."

The following resolution was also carried:—

"That this conference, representative of all sections of the working class, emphatically protests against the suggestion that public money should be used to assist limited liability companies and private owners to build houses that will be let at rentals based on the ordinary laws of supply and demand."

In a further resolution the conference condemned block and tenement dwellings as prejudicial to health and comfort.

FOR OTHER ADVERTISEMENTS
See End of Paper.

FLINTSHIRE COUNTY COUNCIL.
Applications are invited for two positions as Steam Roller Drivers under the above Council. Applicants must be legally exempt from Military Service. Wages at the rate of 32s. per week, with War Bonus allowance in addition. Apply, stating age, experience and qualifications, to the County Surveyor (Mr. Sam. Evans), County Offices, Mold, North Wales. (3,087)

ARCHITECT AND ESTATE AGENT'S OFFICE.—Capable Manager wanted; ineligible for military service.—Apply, stating terms, to Box 1,583, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C. (3,088)

JUNIOR ASSISTANT (22 years), ineligible, seeks position in Surveyor's office. Levelling, tracing and designing; clerical work if desired. Good references.—Box 1,581, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C. (3,085)

SCARIFIER.—Wanted, a Good Second-hand Independent Scarifier, "Thackray" or other type.
Will exchange Morrison if desired.
J. ALEXANDER GREEN,
Surveyor.
(3,086) Eckington, Sheffield.

EASINGWOLD WATER SUPPLY SCHEME.

THE RURAL COUNCIL AND THE ENGINEERS.

An engineers' claim against the Easingwold Rural District Council was discussed at the council meeting recently upon a motion by Mr. Wright: "That the resolution passed on June 2nd in reference to counsel's opinion on this matter be rescinded, and that the engineers, Messrs. Fairbank & Son, be furnished with a copy."

The clerk stated that Messrs. Fairbank were asked by the council to prepare a scheme for what was known as the water level. The work had not been proceeded with owing to the war, but Messrs. Fairbank, whose preliminary fees had been paid, claimed £198. The council had obtained an opinion of counsel on the matter, and it was against Messrs. Fairbank's contention. It was decided that Messrs. Fairbank should not see the opinion of counsel.

Mr. Wright, in moving the resolution, said that Messrs. Fairbank & Son had served the council well for a number of years, and it was only a matter of courtesy that the council should let them see counsel's opinion. It would not hinder the council in any way whatever, and it would be a source of satisfaction to the firm.

After the motion had been seconded,

The chairman (the Rev. H. B. Drew) said he thought it would be a great mistake to rescind the resolution. After they had decided on a course of action, unless some fresh circumstances arose, they ought to adhere to their decision. If he (the chairman) was likely to have trouble with anyone, he did not think he would be inclined to show his adversary his hand.

Mr. Clarke said the matter was a question of principle.

The Rev. A. T. Icely said that it seemed to him that what they wanted to come to was a right, honourable and just conclusion. Every bit of information should be put before both sides to enable them to come to such a decision. He proposed, as an amendment, that each side should furnish to the other copies of their respective counsel's opinion, in the hope that some compromise might be arrived at.

The amendment was not seconded.

The clerk said that Messrs. Fairbank based the claim on the Engineers' Association regulations, which said that if they did work on which a public inquiry was held, and for some reason the work was not carried out, they were entitled to half the commission. Messrs. Fairbank sent in a bill for that amount, and the council had not paid it.

Ultimately Mr. Wright's motion was lost, and it was decided that Messrs. Fairbank should not be allowed to see counsel's opinion.

New System of Building Construction.—Mr. P. C. Smith, the burgh engineer of Dunfermline, reported to a meeting of Dunfermline Dean of Guild Court on Tuesday that Mr Walter Wilson, clerk of works, Dunfermline, had drawn his attention to a new system of building construction which he had patented. The new method was altogether foreign to anything which the Court had experience of, and it was outside the four corners of the Burgh Police Act. From what he had seen, however, he was satisfied that the method was a departure for the better in the way of cheapening construction. He recommended the Court before the patentee had submitted plans to visit the yard and see the models. The Court assented to the suggestion.

Association of Managers of Sewage Disposal Works.—A meeting of the Metropolitan District will be held at the sewage farm, Sutton, Surrey, on Saturday, the 16th inst. Notes on the sewage disposal and purification works will be submitted by Mr. W. H. Grieves, engineer and surveyor to the council. The members will meet at the municipal offices at 3 p.m., where they will be welcomed by the chairman of the council, Councillor J. Wakeford, J.P. After the meeting the members will proceed to inspect the sewage disposal works in Clensham-lane. The objects of interest are: Septic tanks, double contact beds, five percolating filters with revolving distributors, sludge drying beds, refuse paper baler, and general machinery. The chairman of the Farm Committee, Councillor R. W. Wootten, will formally turn on the sewage to the new 66-ft. sprinkler, supplied by Messrs. Ames Crosta Engineering Company, Limited (filtering media supplied by Mr. Frank Keep). Tea will be provided at the sewage works about 5 p.m.

ROAD MAINTENANCE IN BERKSHIRE.

EXTENSIVE DAMAGE BY HEAVY TRAFFIC.

The report of the acting county surveyor, Mr. A. Langston Yockney, for the year ended March 31st last, states that the Berkshire roads have continued to suffer very considerably from heavy traffic, especially the principal trunk roads, such as the Bath road, Reading, Ascot and London road, Reading and Oxford road, Newbury and Oxford road, and the Reading and Eversley road. The result is that the macadam sides have been in places completely worn down. The Tarmac has also suffered to some extent, but as a whole has withstood exceptionally well the enormous increase in this heavy traffic, and the council can still be congratulated on the success of the reconstructed roads. Mr. Yockney thinks it unfortunate that Berks, a purely agricultural county with a low rateable value, should be so situated geographically that it has to take all this traffic whilst many other counties are, generally, getting less than their ordinary traffic.

In addition to this extraordinary traffic, during the year a great number of motor omnibuses have been running on the roads, and new services are being started and existing routes extended.

The Basingstoke road and the Reading-Shinfield-Eversley road have also been badly damaged by the haulage of timber.

Several lengths of road have suffered from the recent high floods and springs, and considerable sums will have to be expended in repairs.

The cost of road material (granite, limestone, slag, &c.), which has to be imported into the county, still increases. In many instances the cost of carriage is more than double the cost of material.

For the greater part of the year the council have been without the services of Capt. J. F. Hawkins, R.E., the county surveyor. Since, however, he has been home on sick leave from Gallipoli, and his subsequent appointment on the staff at the War Office, Mr. Yockney, it appears, has had the benefit of his advice from time to time.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. John S. Brodie, M.Inst.C.E., Borough Engineer and Surveyor, Blackpool.

District Chairman—Mr. J. S. Pickering, M.Inst.C.E., Borough Surveyor, Cheltenham.

SOUTHERN DISTRICT MEETING.

A Southern District meeting is to be held at Bristol on Saturday, September 16th.

PROGRAMME.

11.30 a.m.—Assemble at the Council House.

District Meeting.

Election of District Committee.

Informal discussion on papers describing works to be visited.

1 p.m.—Luncheon at Stuckey's Restaurant. (Tickets 2s. 6d. each.)

Drive to the Suspension Bridge, Clifton and Durdham Downs, Eastville refuse destructor, Barton Hill Baths, inspecting *en route* six sections of bituminous road construction laid during the last four years. (Tickets for conveyance, 3s. each.)

6 p.m.—Tea at Stuckey's Restaurant by invitation of the city engineer.

F. R. Phipps,
Hon. District Secretary.
Borough Surveyor,
Basingstoke.

District Chairman—Mr. J. P. Wakeford, M.Inst.C.E., City Engineer, Wakefield.

NORTH-EASTERN DISTRICT MEETING.

A North-Eastern District meeting is to be held at Wath-upon-Dearne on Saturday, September 30th.

PROGRAMME.

10.15 a.m.—Meet at waterworks pumping station, adjoining Wath-upon-Dearne (G.C.Rly.) Station, and five minutes' walk from Wath-upon-Dearne Midland Station. Proceed to inspect the plant.

10.30 a.m.—Walk alongside the G.C. Railway to the new sewage disposal scheme in course of construction.

10.45 a.m.—Proceed to inspect the sewage disposal works.

11.30 a.m.—Proceed by motor 'buses from near Messrs. Stanley's oil works at Commonlane, along the main road *viâ* Barnsley-road and Brampton to Wath Wood reservoirs to inspect works there recently carried out. *En route* inspections will be made of the public baths, mortuary, sections of Tarmac roads, and private street works.

12.45 p.m.—Leave reservoirs by motor 'bus.

1 p.m. Lunch at the Red Lion Hotel.

2.15 p.m.—Proceed to town hall, where the institution will be welcomed by the chairman of the urban district council, Councillor Chas. Adkins, J.P.

Business:

(1) Minutes of last meeting.
(2) Correspondence.
(3) Election of executive committee.
(4) Any other business.
(5) Orphan Fund and support from N.E. District.
(6) Paper on "Notes of Municipal Works and Statistics in the Urban District of Wath-upon-Dearne," by Mr. J. H. Drew, M.Inst.C.E.I., M.R.San.I. (Member), engineer and surveyor to the urban district council, Wath-upon-Dearne, will be discussed.

5 p.m.—Tea at the Red Lion Hotel, by kind invitation of County Councillor Richard Payne, member of the Wath-upon-Dearne Urban District Council.

In order that the necessary arrangements may be made, members intending to be present must give notice of their intention not later than Monday, September 25th.

MUNICIPAL TRAMWAYS ASSOCIATION.

ANNUAL MEETING PROGRAMME.

The annual meeting of the Municipal Tramways Association will be held at the Surveyors' Institution, Westminster, on Thursday and Friday, September 21st and 22nd.

The proceedings will open at 11 o'clock on the Thursday, when Mr. Peter Fisher, general manager of the Dundee Corporation Tramways, will deliver his presidential address.

The following papers will be submitted for discussion:

"Some Notes on Passenger Transportation in Large Cities," by Mr. J. M. McElroy, general manager of the Manchester Corporation Tramways.

"Utilisation of Tramways for Goods Traffic," by Messrs. G. W. Holford, general manager of the Salford Corporation Tramways, and W. Clough, general manager of the Bury Corporation Tramways.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

CLERK OF WORKS. September 14th.—Mullingar District Lunatic Asylum. £2 10s. per week.—The Chairman, The Asylum, Mullingar, Ireland.

SURVEYOR. — September 14th. — Hollingbourn Urban District Council. £200 a year.—Mr. H. J. Bracher, clerk, Council Offices, 33 Earl-street, Maidstone.

ASSISTANT INSPECTOR OF NUISANCES.—September 20th.—Corporation of Sunderland.—Mr. H. Craven, town clerk, Town Hall.

SURVEYOR.—September 25th.—Warblington Urban District Council. £160.—Mr. W. L. Cooper, clerk, 14 Queen-street, Emsworth.

STEAM ROLLER DRIVERS (2). — Flintshire County Council. 32s. per week.—Mr. S. Evans, county surveyor, Mold.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

WOLVERTON.—September 16th.—For alterations to the bathing place, for the parish council.—Mr. R. Williams, clerk, Church-street, Wolverton.

Engineering: Iron and Steel.

SHEFFIELD.—September 11th.—For the supply of materials and works in connection with the laying of cast-iron water pipe and construction of chambers, for the Electric Supply Committee.—Mr. S. E. Fedden, general manager and engineer, Commercial-street, Sheffield.

DUNDALK.—September 11th.—For supplying and laying about 1,600 yds. of 3-in. cast-iron pipes, and supplying and erecting a fountain and valves, for the rural district council.—Mr. Cahill, Francis-street, Dundalk.

RHONDDA.—September 12th.—For the supply of two scavenging wagons, for the urban district council. —Mr. E. H. Barber, engineer and surveyor, Council Offices, Pentre, Rhondda.

CAPE TOWN.—September 18th.—For the supply of pumps, motors, switch-gear, cables, cast-iron pipes, sluice valves, penstock gates and screens, overhead travelling cranes, and tipping wagons and rails, for the main sewage pumping station.—Messrs. Davis & Soper, 54 St. Mary Axe, London, E.C.

GISBORNE (New Zealand).—October 2nd.—For supplying and erecting a cooling tower for cooling the circulating water used for condensing 9,000 lb. of steam per hour, for the borough council.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, London, E.C.

ARGENTINE.—October 13th.—For the supply of 27,807 metric tons of light pipes and 32,164 metric tons of heavy pipes of cast-iron, for the Ministry of Public Works.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, London, E.C.

Mechanically-Propelled Vehicles.

SEVENOAKS.—September 11th.—For the supply of a steam motor wagon, with a separate tank of 1,000 gallons capacity, fitted for street watering, in addition to ordinary wagon-body, for haulage, for the urban district council.—Mr. S. Towlson, surveyor, Argyle-road, Sevenoaks.

Roads.

CHELMSFORD.—September 11th.—For kerbing public footpaths, and laying paving footpaths, for the corporation.—Mr. Percival T. Harrison, borough engineer, Municipal Offices.

MANCHESTER.—September 12th.—For the supply of pitch for paving purposes, for the Tramways Committee.—Mr. J. M. McElroy, general manager, Corporation Tramways, 55 Piccadilly, Manchester.

CARDIFF.—September 13th.—For road widening at Penhill, for the corporation.—City Engineer, City Hall.

DUNMOW.—September 14th.—For the supply of broken granite, 1½-in. to 2-in. gauge, for the rural district council.—Mr. A. E. Floyd, clerk, Dunmow.

BRITON FERRY.—September 16th.—For the supply of broken granite or basalt road metalling, for the urban district council.—Mr. H. Alex. Clarke, engineer and surveyor, Council Offices, Briton Ferry.

HARROW.—September 16th.—For the supply of broken granite, granite chippings, coarse and fine gravel, tarred granite or slag, and tarred granite chippings, for the urban district council.—The Surveyor, Council Offices, Harrow-on-the-Hill.

SOUTH MIMMS.—September 26th.—For the supply of about 300 tons of Leicestershire or other granite, 1½-in. to 2-in. gauge; 150 tons of ⅜-in. chippings; and 500 tons of blast-furnace slag, for the rural district council.—The Surveyor, Potters Bar.

Sanitary.

BLAYDON.—September 12th.—For the removal of contents of ashpits, for the urban district council.—Mr. R. Biggins, Council Offices, Blaydon-on-Tyne.

FAREHAM.—September 12th.—For house scavenging and emptying cesspools, for the rural district council.—Mr. A. Laker, clerk, 97 West-street, Fareham.

BAKEWELL.—September 16th.—For the construction of a small sewerage scheme, comprising about 110 yds. of 9-in. sewer, with manholes, tanks, and filter-bed, for the rural district council.—Messrs. Brady & Partington, engineers, Town Hall, Chapel-en-le-Frith.

LANCASTER.—September 23rd.—For the removal of house refuse, for the rural district council.—Mr. J. Littlefair, 5 Dulton-square, Lancaster.

HINCKLEY.—September 23rd.—For the removal of nightsoil and house refuse, for the rural district council.—Mr. M. Roberts, inspector, Sapcote.

Stores.

SHEFFIELD.—September 11th.—For the supply of materials and works required by the Electric Supply Committee.—Mr. S. E. Fadden, general manager and engineer, Commercial-street, Sheffield.

HYDE.—September 23rd.—For the supply of engine slack, pitch, oil, cement, and iron castings, for the corporation.—Borough Surveyor, Town Hall.

LEATHERHEAD.—September 26th.—For the supply of broken granite, team labour, disinfectants, brooms, paraffin oil, steam rolling and scarifying, for the urban district council.—Mr. Sidney R. Drake, surveyor, Council Offices, Leatherhead.

HENDON.—September 28th.—For the supply of broken granite, tar-paving material, tarviated granite, granite chippings and gravel, brooms, shovels, forks, and carting materials, for the rural district council. —Mr. J. A. Webb, Great Stanmore, Middlesex.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.

HOLLINGBOURN.—For rebuilding part of a bridge and erecting oak fences, for the rural district council:—

Pack & Waghorn, Egerton	£170
W. T. Burrows, Maidstone	110
J. & S. Clark, Lenham	73
W. Collins, Boughton Malherne *	66

ISLE OF THANET.—For the supply of two wrought-iron galvanised hot-water tanks, for the Guardians:—

A. Olby, Limited, King-street, Ramsgate, £63.

KILLARNEY.—For building nineteen labourers' cottages, for the rural district council:

D. Collins & Co., Cork	£5,897
E. O'Sullivan, Killorglin	5,186
J. J. Fleming, Killarney	4,807

WANDSWORTH.—For surface-water drainage works at Wandsworth Cemetery, Magdalen-road, Wandsworth, for the borough council.—Mr. P. Dodd, borough engineer:—

T. Adams, Wood Green	£718
Mowlem & Co., Westminster, S.W.	709
E. B. Yewen, Croydon, S.E.	577
D. R. Patterson, Camden Town, N.W.	500
E. & E. Iles, Wimbledon, S.W.	435
H. Kellett, Vernon-road, W.C.	399
J. A. Ewart, Limited, Old Queen-street, S.W.	370
Willis & Powis, Wembley	350
S. Lane, Wimbledon, S.W.*	298

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

SEPTEMBER.

16.—Institution of Municipal and County Engineers: Southern District Meeting at Bristol.

21-22.—Municipal Tramways Association: Annual Meeting, Surveyors' Institution.

23.—Institution of Municipal and County Engineers: East Midland District Meeting at Melton Mowbray.

30.—Institution of Municipal and County Engineers: Eastern Sub-District Meeting (Suffolk, Norfolk, and Cambridge) at Stowmarket.

30.—Institution of Municipal and County Engineers: North-Eastern District Meeting at Wath-on-Dearne.

OCTOBER.

7.—Institution of Municipal and County Engineers: Meeting at Watford.

ROAD MAKING.

REINFORCE CONCRETE ROADS WITH
EXPANDED METAL.

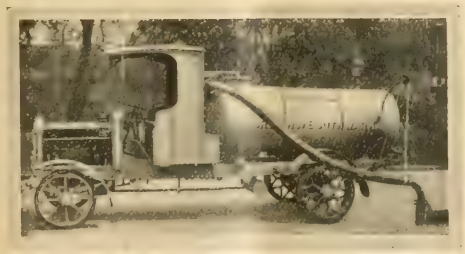
EXMOUTH SEA DEFENCE WORKS. Expanded Steel Concrete Slope and Roadway. Length, 1 mile; total width of Roadway, 65 feet.
Mr. Samuel Hutton, Urban District Council Engineer and Surveyor

THE EXPANDED METAL COMPANY, LIMITED
(Patentees and Manufacturers of Expanded Metal).
Head Office: YORK MANSION, YORK STREET, WESTMINSTER, LONDON, S.W.
Works: STRANTON WORKS, WEST HARTLEPOOL.

Straker-Squire

For

all types of Vehicles



This Petrol Motor Gully Wagon in the service of the Borough of Southwark is effecting a saving of 20 per cent.

5-Ton "Straker-Squire" Wagon supplied to Messrs. Bristowe & Co., of Westminster, S.W., for dealing with tar in barrels.

to suit PUBLIC WORKS requirements.

STRAKER-SQUIRE (1913), LTD.,
56—NELSON SQUARE—56
Blackfriars, LONDON, S.E.

SOMERSET COUNTY COUNCIL.

Wanted, Temporary Assistant in County Surveyor's Office. Must have good knowledge of modern road and bridge construction, be an active motor cyclist, and ineligible for the Army. Salary £120 and allowance of £30 per annum for upkeep of motor cycle. Apply, giving age and full particulars of experience, to

GORDON R. FOLLAND,
Acting County Surveyor.

13 Chamberlain-street,
Wells. Somerset. (3,066)

HOLLINGBOURN RURAL DISTRICT COUNCIL.

APPOINTMENT OF SURVEYOR.

The Council invite applications for the Appointment of a Surveyor of Highways for this District at a salary of £200 a year, the duties to commence on the 1st day of October next.

The appointment to be subject to termination by six months' notice. Applications must be accompanied by three recent testimonials to be received by me not later than 10 o'clock on the 14th day of September next.

By order of the Council,
H. J. BRACHER,
Clerk.

Council Offices,
33 Earl-street,
Maidstone.
August 24, 1916. (3,077)

WANTED—Two or three Working Foremen, used to tar-spraying and the laying of tar-macadam roads, footpaths, playgrounds, &c. Give full particulars, experience and wages required. Must be ineligible for military service.—Apply B., c/o W. H. Smith & Son, Lichfield-street, Wolverhampton. (3,080)

WANTED—Driver for Steam Roller. Apply F. Richards, Surveyor, Oldbury, Bridgnorth. (3,081)

TENDERS WANTED.

ANNUAL CONTRACTS.

LEATHERHEAD URBAN DISTRICT COUNCIL.

The above Council invite Tenders for the undermentioned Materials and Work for the year ending September 30th, 1917:—

Broken Granite.
Team Labour.
Disinfectants.
Brooms.
Paraffin Oil.
Steam Rolling and Scarifying.

Specifications and Forms of Tender can be obtained at the Offices of the undersigned.

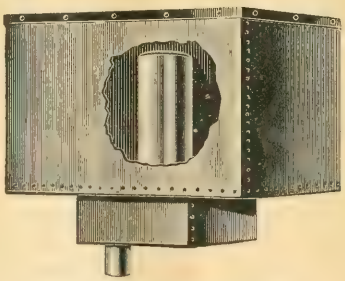
Tenders to be sealed and delivered to me by 5 p.m. on Tuesday, September 26th, endorsed "Tenders for —."

The Council do not bind themselves to accept the lowest or any Tender.

SIDNEY R. DRAKE,
Surveyor.

Council Offices, Leatherhead.
September 2, 1916. (3,079)

BRABY'S
AUTOMATIC FLUSHING TANKS.



SIMPLE. RELIABLE.

Illustrated Price List on application.

FREDK. BRABY & CO. Ltd., 352 to 364 EUSTON RD., N.W. IDA WORKS, DEPTFORD, S.E.

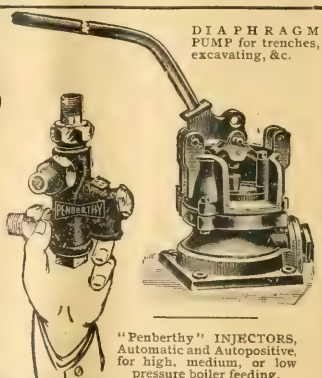
32-38 Southwark Street, London, S.E.

"Penberthy" Automatic CELLAR DRAINER for removing "flood" troubles.

DIAPHRAGM PUMP for trenches, excavating, &c.



"Penberthy" INJECTORS, Automatic and Autopositive, for high, medium, or low pressure boiler feeding.

The Surveyor

And Municipal and County Engineer.

Vol. L. SEPTEMBER 15, 1916. No. 1,287.

Minutes of Proceedings.

The Engineer and the Future.

The strength of the engineer in new countries is due to the fact that he is unhampered by tradition, and does not have to consider a number of conflicting interests which bind the engineer in this country. Here too much respect is paid to the past, which, glorious though it may be, is less important than the present and of very little consequence in comparison with the future. Links with the past are regarded by many persons as being sacred, whereas they are very often merely fetters which bind us to old and worthless methods. The habit of thought which looks with suspicion and dislike upon every new method or change is not one which belongs to the engineer, but it does belong to those who employ him. The type of man who is elected to represent the people in Parliament, on municipal councils, or on boards of directors possesses on the average one strong characteristic dear to the heart of the general public in the past—namely, a rooted dislike and mistrust of new methods. Men of this type, who consider all inventors more or less crazy, who will risk no money on "the mad ideas of engineers or scientists," who think that reinforced concrete is not to be trusted sufficiently to merit a long-period loan, who are ever looking backward and never forward—these men have been in the past generally esteemed persons of sound common sense such as should deal with the spending of public money. The result is pitiable. In a time of stress like the present we find that many important trade methods—the property of the enemy—are unworked and unknown in this country. While the engineer in the newer countries is developing new methods and carrying out great works which are of incalculable value and saving, the engineer in this country, in no way inferior in energy or knowledge, must mark time and do just as much as his employers and various Government departments and other authorities will permit.

Will the present war and the conditions which produced it lead to any change? In this time of great need the engineer has suddenly come to the front and saved the situation, working for once unhampered. The result is a sudden marvellous advance in many mechanical matters, such as the flying machine, and in many others which may not be mentioned. The hour found the man ready, and this war will be won by the mechanical engineer. Will such an object-lesson produce any result in the other branches of the profession? Is it too much to hope that a time will arrive when the engineer will be allowed to carry out what he really knows and believes to be the best scheme? At present he cannot do so, for he knows that if he did he would at once be hampered at every turn by persons and authorities who would demand a precedent and stop anything that was beyond their very limited comprehension. Thus the successful engineer must be a diplomatist who can work out a scheme which will first of all avoid all these pitfalls and objections made by corservative persons and authorities, and who can, moreover, ingeniously contrive to produce a scheme that will give certain results required without wasting too much money. That large sums of money are wasted owing to the way in which engineers are thus hampered is well known to any municipal engineer. Certain items of waste he must accept—*e.g.*, it would be absurd under certain conditions to suggest reinforced concrete, notwithstanding the great saving which its adoption would effect. It would be risky to suggest the purification of sewage by dilution in a large river, notwithstanding the advice of the Royal Commission experts. Sterilisation of an abundant water supply near at hand would (notwithstanding hundreds of splendid examples) very likely be rejected in favour of a more costly scheme wherein the always risky expedient of making deep borings was included, or in which a long line of main was carried to a purer source. Sterilisation of sewage would be regarded as an impossibility, notwithstanding excellent existing examples. The laying of new mains to replace those injured by corrosion within a comparatively short period would be readily approved, but a scheme wherein the water was to be treated so as to prevent the corrosion would possibly be difficult to carry through. Endless similar instances could be given showing beyond doubt that the engineer in this country is rarely allowed to use his full knowledge in the practice of his profession, say to the same degree as the medical man can in his profession. Having obtained the services of an engineer, it is customary for his employers to require him to prove the merit of his scheme by reference to other older works. Nothing entirely new and original is likely to be accepted, and if it were accepted it would be upset by some higher authority. Progress under such conditions is almost impossible, and waste of public money is assured.

The immediate future will be a time when brains must be used to the uttermost in order to prevent waste. Those employed for the work must be men of proper attainments, and must be trusted to the degree to which their attainments

enable them. The prejudice against new ideas and methods must be removed, and, with the general acknowledgment of the value of scientific training and knowledge, better times should come. Things move quickly in this age; what was good a short time ago has already been outclassed and superseded. To work by precedents under such conditions is the greatest folly. What is required now is the newest and best. A period of reconstruction is at hand, of great engineering activity, a time of new opportunities in which the engineer must have a free hand if this country is to reap the full advantage. Those who stand in the relation of employer to the engineer must be men of a different type. The over-cautious, scientifically ignorant man, formerly regarded as a person of sound common sense, is already disappearing. He is a back number and a link with the past with which we can readily dispense. Similarly it should shortly be impossible for Government departments to stand in the way of progress; they too will have learned something from the present as distinguished from the past.

* * *

State-aided Research.

Mr. Gerald Stoney, of Newcastle, who presided over the engineering section at the recent meeting of the British Association in that city, drew attention to the handicap which our industries impose upon themselves by their reluctance to utilise highly educated labour or to adopt scientific methods. There can be no doubt that if our future competition with other countries is to be successful, much greater attention must be paid to the vitally important work of scientific research. There are three distinct channels through which such work may be carried on, and we venture to say that in every one of them Great Britain has hitherto been far behind her competitors. First, there is the employment of scientists for research work by individual firms or combinations of firms. In this direction there has not only been the general reluctance to which Mr. Stoney referred, but internecine competition has led to a general failure to appreciate the true value of combined action in any given trade as a weapon against foreign encroachment. In the national interest it may be stated as a general principle that improved methods of production should be made available for all who may be interested. The next medium is that of the engineering colleges. Much good work has been done in this direction, often under great difficulties for want of plant and money, and it is greatly to the credit of our professors and others that they have succeeded in doing so much with the very inadequate appliances at their disposal and handicapped for want of funds. How inadequate their income is can be understood when it is remembered that Leipzig University alone has an annual income from the German Government of £100,000, as against a total Government grant to all the universities here of about £45,000. Finally, there are the National Research Laboratories. Of these there is only one in this country —the National Physical Laboratory at Teddington—and here again the support given to it is totally inadequate. The total income from all sources last year was only £40,000, and of this £23,000 was charges for work done, such as testing meters and other instruments and similar commercial work; the Government grant was only £7,000 a year, and besides this £7,500 was received for experiments in connection with aeronautics, which was really war work. The balance was made up of subscriptions, grants from technical societies, and miscellaneous receipts. Compare this with the German equivalent, the Reichsanstalt of Berlin, which has an income of £70,000 a year from the Government, or ten times that given to our National Physical Laboratory. The Bureau of Standards, the similar institution in the United States of America, has a Government grant of £140,000.

It was an interesting circumstance that Mr. Stoney's address should have been delivered within a few days of the issue of the first annual reports of the Privy Council Committee and the Advisory Council appointed to carry out the scheme initiated last year by the Government for the promotion of scientific research in relation to trade and industry. Summarising the conditions which appear to them necessary for the success of their work, the council point to the necessity for a largely increased supply of competent researchers, and a hearty spirit of co-operation among all concerned—men of science, men of business, working men, professional and scientific societies, universities and technical colleges, local authorities and Government departments. Neither condition will be effective without the other. The first cannot be secured rapidly at any time, and for the moment is out of the question. As regards the second condition of success, progress in co-operative effort is undoubtedly being made in many directions. But there are specially strong reasons for more co-operation between the various British firms in each industry and between the industries and the State in the furtherance of research. In our opinion finance is at the root of the matter, and the serious problem that will arise after the war can only be solved by larger State grants to colleges to be used, in part at any rate, as research studentships, and by largely increased financial aid for research work in each of the other directions above indicated.

* * *

Water Supplies in Scotland.

We have on a former occasion discussed in these columns the desirability of the establishment of a central water authority for England and Wales with a view to securing a more equitable utilisation of the available sources of supply, and we now turn to the almost equally important case of the Scottish water supplies. In Scotland, as in England, the present system by which power to take supplies is obtained in each case by an application to Parliament or by Provisional Order under the Private Legislation Procedure (Scotland) Act, 1899, is apt to work unfairly in more than one way. In the first place open competition for the sources of supply is bound to give an advantage to the larger and wealthier towns. On the other hand, the practice of giving the smaller local authorities on the route of the main pipeline the right to demand a supply from the promoters of a large undertaking not infrequently operates unfairly against the larger authority. The general principle of affording these ancillary supplies *en route* is both fair and economical, but experience has shown that the right to demand them is often obtained when they are not wanted or used, and the considerable expense incurred in installing works so as to be able to meet the demand, if it should be made, is entirely wasted. Another undesirable result of the present mode of proceeding arises in cases—not infrequent—where two adjoining local authorities take separate supplies of water from neighbouring sources when a sufficient supply for both communities could have been obtained from one source at a very considerably reduced expenditure.

In the *Journal of State Medicine*, Mr. John L. Jack, the town clerk of Dunfermline, who has had considerable experience of the defects of the present system of allocating the sources of water supply in Scotland, urges the desirability of reforms in the directions indicated. It will be remembered that in 1910 a Bill was introduced into Parliament having as its main object the provision for further control over the sources of supply in England. The Bill was referred to a

Joint Select Committee and it is interesting to hear in mind that this committee, after full consideration, embodied in their report a definite expression of opinion that any local authority asking for a supply *ex trans tu* should be obliged to enter into a definite obligation to take or pay for the supply so demanded. In the last paragraph of their report the committee urge the need for a survey, at once comprehensive and in detail, of the water supplies and water needs of the country, and for the adoption of measures for conserving the supply and disposing of it to the best advantage. Such a policy is becoming increasingly necessary both for Scotland and England, and it is to be hoped that an early opportunity may be taken of carrying it into effect on the termination of the war.

* * *

The Dublin Town Planning Designs.

In recording the fact that three local men, in the persons of Prof. Abercrombie, Mr. Sydney A. Kelly, and Mr. Arthur J. Kelly, had been awarded the prize in the replanning of Dublin competition, the *Liverpool Post* reminds us that this particular scheme is really the first town planning competition for any capital city in the British Isles, the others having been schemes merely for laying out or relaying portions of a city or district. It is, of course, a fallacy to suppose that the competition had its origin in the recent regrettable events in Dublin. These events had an influence in hastening the decision of the assessors, but the fact remains that the movement emanated from Lord Aberdeen, and followed upon a Royal Commission on the rehousing question in Dublin which sat before the outbreak of the war. The writer of the article states that the dominating idea embodied in the Abercrombie-Kelly plans has been the creation of a new central area and traffic centre on a site now occupied by derelict property. For such a traffic centre there is an urgent need in Dublin, inasmuch as Sackville-street, the leading thoroughfare—large!, a monumental street—fails to provide the necessary space for traffic circulation, especially for tramcar traffic. Right in the heart of this central area it is proposed to build a central terminus for all the railway lines entering Dublin. At present the respective termini are wide apart, and one or two are inconvenient of access. On this central area all the main streets are to converge, and in addition there are to be two or three new outlets to the suburbs, as well as a new and picturesque Mall connecting up Phœnix Park with the city proper. The successful competitors have also dealt with the housing question by a large building scheme to accommodate quay workers on lines already adopted in Liverpool, and have allowed for suburban development in three other places, also providing for a reclamation scheme in Dublin Bay and an extension of the docks. Mr. Sydney A. Kelly, who with his cousin Mr. Arthur J. Kelly and Prof. Abercrombie share the prize-winning honours, are to be congratulated upon their success. The first-mentioned gentleman has already done town planning work. In conjunction with the city engineer of Liverpool, Mr. J. A. Brodie, he laid out Queen's-drive, a well-known avenue on the outskirts of that city, and others of his schemes are said to be distinguished for their technical skill, practical knowledge, and progressive thought. The designs, we may state, will be exhibited for public inspection at a town planning exhibition to be held in Dublin at an early date.

* * *

Responsibilities of Municipalities.

In his report covering the year ended June 30th last, Mr. G. S. Burt Andrews, the town engineer of Johannesburg, has a note with regard to two interesting cases which have been decided by the Supreme Court—the one as to his council's liability in the diversion of storm water, and the other the liability for the maintenance and care of public roads. In the former case the Court held that a municipality is entitled to construct drains and to divert thereby the natural flow of water, and that in so doing it will not be liable if no greater burden be placed on private property either as regards the quantity, velocity or direction of the water which in the ordinary course of nature would flow over such property. The other case is one in which a cyclist collided with some stones on an unmacadamised road, and, in consequence, received injury to the thigh. The Court held that the law imposed no greater liability upon a municipality for failure to keep in repair the ordinary surface of a properly constructed or repaired road than in respect of a road which had never been the subject of municipal operations. These judgments are of the utmost importance to this department, as they clearly define the council's liability on the questions of storm water and roads. The question raised in the former case has not, so far as we remember, been the subject of any decision in the English Courts. The principle that there is no right to the natural flow of underground water which is not in a defined channel is well established; but the Johannesburg case is the reverse of this, and will form a useful precedent to any local authority that may be sued in respect of damage due to an increased flow brought about by drainage works. The case of the injured cyclist, although of local importance, is not of such great interest in this country, where the principles of liability on the part of highway authorities for negligence are fairly clearly defined. It is obvious that no action for negligence founded on non-repair can succeed against a highway authority in respect of a highway for the repair of which they are not responsible; and in the case of highways for which they are responsible, the broad principle that they are liable for acts of *misfeasance*, but not for acts of *non-feasance*, is well established, although often difficult to apply to the facts of individual cases.

* * *

Surveyors and Petrol.

There is still considerable dissatisfaction with the allocation of petrol supplies since the census was taken some weeks ago. We have already called attention to the totally inadequate allowances made to surveyors whose consumption of the precious spirit is wholly or mainly due to the performance of important public duties which necessarily entail much travelling by road, and particulars of another example have reached us. Our correspondent is a district surveyor responsible for 200 miles of district and 80 miles of main roads, maintained by contract, in a very hilly neighbourhood in which labour is scarce in consequence of the war. He made out a petrol return asking for the honest low minimum of 12 gallons per month, and in due course received an intimation that 6 gallons per three months had been allotted. He replied asking whether an error had been made or whether it was that he had been wrongly classified, as his "running" was entirely on district supervision. Ultimately a reply was received to the effect that no more than 6 gallons could be allowed. If, as we fear, this case is typical of many others, the position is certainly astonishing. The total amount of petrol applied for was so far in excess of last year's consumption as to demonstrate the existence of widespread dishonesty in making out the returns. The nett result seems to be that, while pleasure riding in private and public vehicles continues to a large extent, the one class of public officials whose work renders motor locomotion a virtual necessity cannot obtain sufficient to enable them to carry out their duties. Cannot the question be raised again in the House of Commons after the recess?

Eastville Refuse Destructor, Bristol.

For several years past the city of Bristol has been a noteworthy centre of activity in ferro-concrete construction of all kinds. The introduction of the Mouchel-Hennebique system in the city was due to Mr. W. Y. Armstrong, the Great Western Railway New Works engineer, under whose direction an important wharf was built to carry railway traffic in the year 1903. This work was followed in 1904 by Brandon Wharf, constructed for the city council, under Mr. T. H. Yabbicom, M.INST.C.E., then city engineer, and Canon's Marsh transit sheds for the Docks Committee of the corporation, under Mr. W. W. Squire, M.INST.C.E., their engineer.

Among other public works carried out in ferro-concrete during succeeding years may be mentioned granaries, transit sheds and other works at Avonmouth (1907-11) for the Docks Committee, the river Frome covering (1906), foundations for a large electricity transformer station (1907), under Mr. H. Faraday Proctor, M.I.E.E., the city electrical engineer, Fishponds Schools (1910) for the Education Committee, from the architectural designs of Messrs. Rodway and Dening, Chaplin-road sewer (1911), and the Eastville refuse destructor works, forming the subject of the present article. In addition to the foregoing, a large number of important structures have been constructed on the Mouchel-Hennebique system in Bristol and neighbourhood for hospital and water authorities, the Great Western Railway, industrial companies and others.

Fig. 1.—View of Approach Viaduct, Eastville Destructor.

The Eastville refuse destructor station of the Bristol City Council includes a long ferro-concrete approach viaduct, tipping platform, destructor building and chimney, shaft foundations, and clinker plant foundations.

The station is situated on the outskirts of the city, a part view of the approach viaduct being reproduced as Fig. 1.

Fig. 2 is a general plan showing the form of the viaduct, which commences at the bridge indicated on the left-hand, making a right-angled bend of 26 ft. 6 in. radius about the middle of its length and terminating at the tipping platform over the main flue between the destructor building and the chimney stack.

Commencing with two curved wing walls, forming an easy approach from the bridge and road, the ferro-concrete viaduct is 22 ft. 6 in. wide over all, having a roadway 18 ft. wide. It proceeds in a straight line for a length of 90 ft., after which comes the right-angled bend, measuring 45 ft. along the inner side, 95 ft. along the outer side, and 70 ft. on the centre line. The remainder of the viaduct is 120 ft. in length, the last two bays being widened to connect up with the tipping platform, as shown in the small plan at the left-hand of Fig. 2.

Various sections of the viaduct are given in Fig. 3. Referring to the longitudinal sections A-B and C-D, it will be seen that the entire structure is founded on ferro-concrete piles, 12 in. square in cross-section, driven to a depth averaging about 26 ft. below the original level of the ground, those in the first portion, 90 ft. in length, being spaced 22 ft. 6 in. apart centre, those in the curved portion being about 15 ft. apart on the inner side and 23 ft. 9 in. apart on the outer side, and those in the remainder of the length being 22 ft. apart, with the exception of the two end bays, where the piles are spaced at intervals of 18 ft. and 14 ft. respectively.

At a height corresponding with the average ground level, the two lines of piles are connected by horizontal bracings, 8 in. wide by 14 in. deep, and above these the piles are carried up as columns for the support of the decking beams.

The two lines of piles are spaced 17 ft. 6 in. apart, the width of 22 ft. 6 in. being provided by cantilever extensions of the transverse deck beams. These members are 10 in. wide by 24 in. deep, their outer ends carrying the railing bases and the kerbs for the roadway. There are three series of continuous longitudinal beams, 7 in. wide by 17 in. deep, the two outer lines being supported by the pile columns, and the inner line by successive transverse beams. The decking is completed by secondary transverse beams, and a continuous slab, 3½ in. thick, on which is laid a pavement of 9-in. by 4-in. by 3-in. Jarrah wood blocks. These details are further illustrated by the sections E-F, and G-H, and by the enlarged drawings of the road construction.

It will be noticed that the viaduct provides for the raising of the ground level along the entire length, and the formation of an embankment at the approach where the wood paving is laid on a concrete bed over the filling.

Fig. 4 is a plan of the ferro-concrete foundations for the destructor building, main flue and chimney shaft. The work consists essentially of a foundation raft for the uniform distribution of the load over the soil, and the raft receives auxiliary support from a number of ferro-concrete piles, thus ensuring absolute security from any risk of settlement or undue strain on any part of the raft. The positions of the piles and the arrangement of the beams in the raft are shown clearly by the drawing reproduced.

The main portion of the foundation is that under the destructor building, measuring 115 ft. 6 in. long by 76 ft. 8 in. wide. As the loads to be carried include a superload of 2 cwt. per square foot and concentrated loads ranging from 2 tons up to 32 tons, the spacing of the piles is not absolutely uniform, and for the same reason the dimensions, as well as the spacing of the main and secondary beams, are varied somewhat with the object of securing maximum stability and economy.

Between the main foundation and that for the chimney shaft is the raft carrying the main flue, this raft being about 35 ft. by 25 ft. 6 in. wide. The chimney shaft foundation is 19 ft. square, and consists of a slab, 9 in. thick, stiffened by four ribs, and supported on sixteen piles in four rows.

All the piles are driven down to a bed of marl, encountered at an average depth of 28 ft. below foundation level. The sections reproduced as Fig. 5 will give the reader some idea of the unusual conditions to be complied with in the design of the foundations.

Fig. 6 contains a plan and sections of the foundations for the clinker plant-house attached to the destructor station. Measuring 76 ft. long by 8 ft. 6 in. wide, the foundation is somewhat similar in

character to those previously described. In addition to a superload of 2 cwt. per square foot on part of the foundation, concentrated loads up to 33 tons have to be carried by some of the piles and beams.

After completion of the tipping platform, official tests were conducted in the presence of Mr. G. E. Ford, deputy city engineer; Mr. Wilson, district surveyor; Mr. Edmund J. Cullis, ASSOC.M.INST.C.E., district engineer to Messrs. L. G. Mouchel & Partners, Limited; and Mr. H. Hoyle, representing the Yorkshire Hennebique Contracting Company, Limited, of Leeds, who were the contractors for this portion of the work.

Measurements of deflection in a selected main beam were taken by means of three Mouchel pattern instruments. This beam extends from a column to one of the outer walls, and has a clear span of 14 ft. One instrument (No. 1) was placed 3 ft. from the column, another (No. 3) 3 ft. from the wall, and the third (No. 2) beneath the middle of the span.

Under a uniformly distributed load of 2 cwt. per square foot the maximum deflections were $\frac{1}{64}$ in. for instruments Nos. 1 and 3, and $\frac{1}{32}$ in. for instrument No. 2, and on removal of the load the beam returned to its original form, showing an entire absence of permanent deflection.

The specification permitted a maximum deflection of $\frac{1}{16}$ in., equal to very nearly $\frac{1}{600}$ of the span, whereas the actual deflection of $\frac{1}{32}$ in. amounted to only $\frac{1}{3376}$ of the span.

A further test, conducted on one of the secondary beams extending between the main beams and wall, and having a clear span of 12 ft. 6 in., resulted in a maximum deflection of $\frac{1}{64}$ in. at the centre, equal to $\frac{1}{2400}$ of the span, as compared with the deflection of $\frac{1}{4}$ in., equal to $\frac{1}{600}$ of the span, allowed by the specification. In this case also there was an entire absence of permanent deformation.

Two months later the portion of the approach viaduct represented in Fig. 7 was tested in the presence of Mr. G. E. Ford, Mr. Harding, and Mr. F. Wilson, representing the city engineer's department, Mr. W. H. Williams, clerk of works, and Mr. Edmund J. Cullis, representing Messrs. L. G. Mouchel & Partners, Limited.

The test load prescribed was a lorry representing

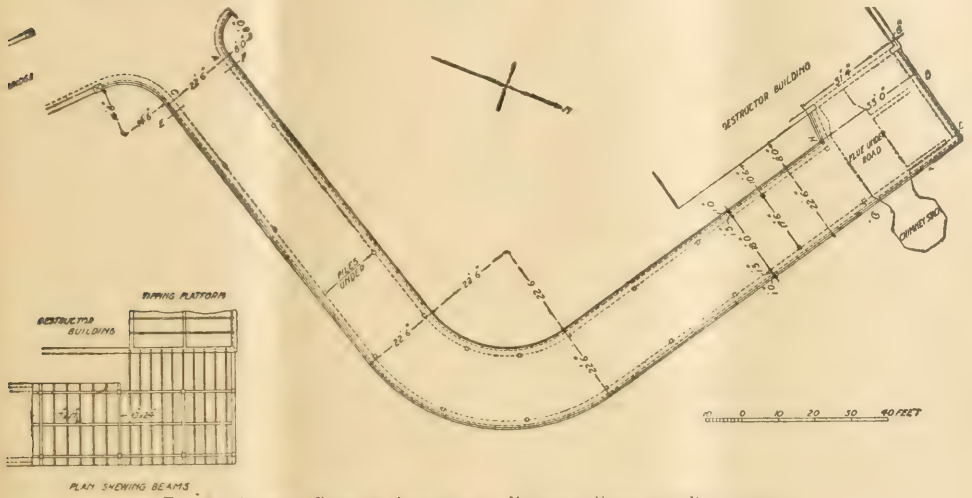


FIG. 2. GENERAL PLAN OF APPROACH VIADUCT, EASTVILLE DESTRUCTOR.

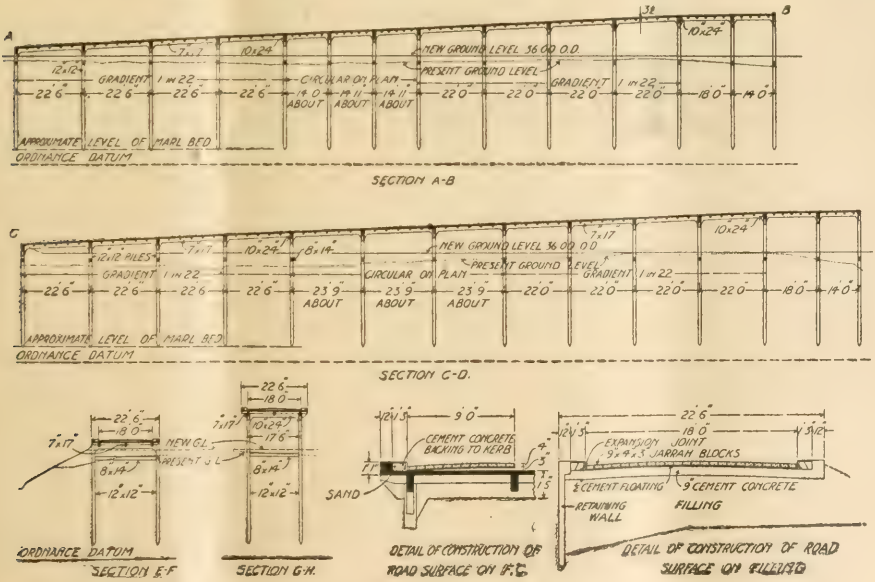

FIG. 3. SECTIONS OF APPROACH VIADUCT, EASTVILLE DESTRUCTOR.

a weight of 8 tons on four wheels. Deflectometers Nos. 1, 2 and 3 were placed under three of the transverse beams, measuring 16 ft. 6 in. clear between the supporting columns.

With the load at a standstill over Instrument No. 2, the maximum deflections recorded were as follows: No. 1 Instrument, $\frac{1}{100}$ in.; No. 2 Instrument, $\frac{3}{64}$ in.; No. 3 Instrument, $\frac{1}{100}$ in.

When the load was moving the maximum deflections at the same points were $\frac{1}{64}$ in. at all three instruments.

The contract conditions provided for a maximum deflection of $\frac{3}{4}$ in., or $\frac{1}{660}$ of the span, which is twenty-one times the deflection actually developed under the test load.

Instrument No. 4 was placed beneath one of the

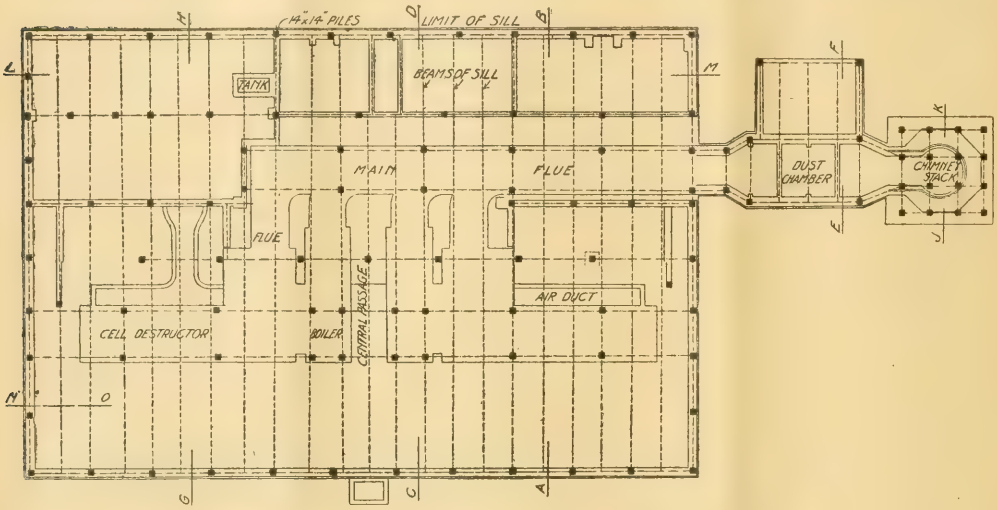

Fig. 4.—Plan of Foundations for Eastville Destructor Building.

secondary longitudinal beams carried by two main transverse beams, the member in question having a clear span of 18 ft. between supports, and when under the moving load of 8 tons it showed a maximum deflection at the middle of $\frac{1}{64}$ in., or $\frac{1}{1080}$ of the span

particulars are given of the operating expenses at the Cults steam pumping station.

In the twelve months covered by the report the quantity of water pumped was 585,294,164 gallons, the costs being as follows: Wages, £286; coal, £890; stores,

as compared with $\frac{3}{4}$ in., or $\frac{1}{660}$ of the span permitted by the specification. This result and the absence of permanent deflection sufficiently denote the large surplus of strength and elasticity provided by the construction.

The works were designed by Mr. T. H. Yabbicom, M.Inst.C.E., when city engineer of Bristol, and executed under the direction of Mr. Lessel S. McKenzie, M.Inst.C.E., who has succeeded to the position of city engineer. Working drawings of the ferro-concrete

materials, &c., £53; total, £1,229. This represents a rate of 42s. per 1,000,000 gallons.

Although the cost of coal per ton has very considerably increased during the war, it is satisfactory to note that the actual consumption per 1,000,000 gallons pumped has steadily decreased. The figures for the last six years are 1·67, 1·64, 1·42, 1·41, 1·41 and 1·39 tons.

At the hydraulic pumping station 27,468,315 gallons of water were pumped at a total cost of £80, or £2 18s. 3d. per 1,000,000 gallons.

ABERDEEN CORPORATION WATERWORKS.

PUMPING COSTS.

In the annual report of Mr. C. H. Roberts, the city water engineer of Aberdeen, an abstract of which appeared in our issue of last week, some interesting

WAR AND THE HOUSING PROBLEM.

DISCUSSION AT SCOTTISH SANITARY ASSOCIATION CONGRESS.

On Friday last, at the concluding sitting of the annual congress of the Incorporated Sanitary Association of Scotland, Councillor William Graham, M.A., Edinburgh, in the attern on introduced a discussion on "War and the Economic Aspects of the Housing Problem." It was unnecessary, he said, to do more than mention the admitted evils which everywhere attended bad or deficient housing. Every year tuberculosis reaped its enormous and tragic harvest. Infantile mortality provided painful statistics. In St. Leonard's Ward in Edinburgh the rate in 1915 was 189 per 1,000 births, compared with 45·4 in a well-housed ward like Morningston. With statistics like these in all large centres, a declining birth-rate, and the ravages of war, this was not the age for weak-kneed action in housing reforms. Writers and thinkers of all shades of opinion were now convinced that it was only the great machinery and resources of the State which could effectively face a problem which had largely ceased to be local and was now really national in character. If the money was found by the State any local authority might, under the Housing and Town Planning Act, 1909, as applied to Scotland, borrow money with a period of redemption up to 80 years. The choice which faced us as a people to-day was the plain one of spending public money on good housing, or spending it in the treatment of consumption and other disease, and provision for crime in the crowded areas.

Mr. W. E. Whyte, Middle Ward District Committee, who followed, gave details of the housing scheme carried out by his committee. They had erected 150 cottage dwellings, and were in the course of erecting other 200 cottages. The prevailing conditions were now such that Government should be called on to assist local authorities with a monetary grant until normal conditions returned. The care of public health was committed to local authorities, and if public health was to be preserved housing accommodation must be provided.

Mr. William Ross Young, town planning engineer to the Middle Ward, gave further details of the building scheme referred to.

ECONOMY IN BUILDING.

Mr. Peter Fyfe, Glasgow, said he thought Scottish independence would be against any form of subsidy for housing. Rather wages should be raised to enable working men to pay the necessary rent. Working men's houses in Glasgow were far too substantial, and cost far too much money. In economy in building houses England was far ahead of us.

Councillor Wheatley, Glasgow, said he hoped they would not think Mr. Fyfe represented the feelings of the people of Glasgow on the problem of housing. Since 1914 they had practically doubled wages, but unless they could control not only the wages but the things that the wages had to buy they might as well let things alone. All the things provided in sanatoria—airy bedrooms, beautiful surroundings, nourishing food, and medical supervision—should be provided in the people's homes.

Mr. J. Walker Smith, town planning engineer to the Local Government Board, said the housing conditions in industrial communities in Scotland were worse than in any other part of the United Kingdom, with the possible exception of Dublin. The Englishman paid 12 per cent more rental than the Scotsman, but got 42 per cent better value for his money. The tenement method of housing was an extravagant system.

Electric Tramway Traction. (By Albert D. Greatorex. Post free, 2s. 8d. St. Bride's Press, Limited, 24 Bride-lane, E.C.).—"Will be of service to those who wish to obtain some general knowledge regarding electric tramway systems."—*Electrical Review.*

Bristol Electricity Profits. The annual report of the Bristol Electrical Committee shows a nett profit of £7,911, out of gross receipts amounting to £132,928. With the balance brought forward and an adjustment of income-tax there is apparently a surplus in hand of £15,721. As a matter of fact £6,429 of that sum has been spent on work not chargeable to loan account, including £2,391 allowances to men serving with the Colours. The £15,721 is thus reduced to £9,292, which is carried forward.

The Future of British Engineering Works.—In view of the national prominence of the engineering industry the Lord Mayor is convening a public meeting at the Mansion House at 3 p.m. on Wednesday, September 20th, to discuss future trade policy with special reference to the economic utilisation of the engineering works of the nation which have been so largely expanded in capacity and equipment during the past two years. The organisation of the meeting is being undertaken by the British Electrical and Allied Manufacturers' Association, with the support of the British Engineers' Association, the British Empire Producers' Organisation, and the Engineering and Electrical Sections of the London Chamber of Commerce. Applications for tickets of admission should be sent to Mr. T. C. Elder, organising secretary for the meeting, B.E.A.M.A. Offices, 36 Kingsway, London, W.C., or to the secretaries of any of the above organisations.

The Use of Motor Vehicles in Municipal Work.

MECHANICAL *v.* HORSE TRACTION.

By H. SHAW, M.INST.C.E., Engineer and Surveyor to the Ilford Urban District Council.

[In the following exhaustive report, prepared for the information of the Works Committee of his council, Mr. Shaw presents a mass of valuable facts and figures derived from the experience of various municipalities, and from his own knowledge, as to the advantages and disadvantages of mechanical versus horse traction, and discusses in detail each method of propulsion in order to enable the committee to decide whether the council's work can be carried out to greater advantage by the substitution of horse labour by mechanical traction.]

Mechanical traction can be employed in a variety of ways, and is being increasingly used by municipalities in street and road works of all kinds, including watering and sweeping, haulage of material, collection of house refuse, gully cleansing, sewer flushing, &c., and no doubt, under suitable conditions, is found to be more economical than horse-driven vehicles, especially during the present time, the existing circumstances involving a shortage of direct labour, difficulties in hiring, and an increased cost in the purchase of horses; and the hiring rates certainly tend towards the adoption of motor traction.

There are many factors, however, which have important relationship to the ultimate success or otherwise of the working of mechanically propelled vehicles, and contribute largely to the suitable conditions.

In the first place, the districts vary considerably with regard to the road surfaces and gradients. In this district the prevailing conditions are advantageous for mechanically propelled vehicles, as the road surfaces are good, and the whole district very level, while the traffic conditions, with the exception of the high road, are favourable, there being little traffic to be contended with, and the vehicles will not always be stopping and starting.

Secondly, with the workshops and engineering appliances under the council's control, the facilities for quick repairs are excellent.

Thirdly, the kind of work or services to be undertaken by traction should be very carefully considered, as, to make any type of traction profitable, it is necessary to avoid very short journeys, provide good loading and discharging facilities, and therefore mechanical tippers should be purchased in every case.

Fourthly, it is also essential that the motors should be kept continually working; in fact, the greater the number of hours a day the machine is actually travelling, the better financial results will be obtained, and therefore interchangeable bodies should be provided, to ensure that each and every chassis should not waste time standing idle.

It is also most important that full loads, up to the maker's guaranteed capacity, should always be carried, as the mileage rate for motor vehicles is greater, generally speaking, than horse labour, and it is only by carrying heavier loads that economy can be achieved; hence the greater load carried the cheaper is the carrying cost per ton-mile.

I should, however, note, *en passant*, that vehicles should not be loaded to more than the maker's guaranteed nett load capacity.

Further, to a large extent the success or otherwise of the motor vehicle depends upon the state of efficiency in which it is maintained. Probably no piece of machinery deteriorates so rapidly as a motor vehicle, if neglected. The hard work required of it, the enormous vibration to which it is subjected, the trying conditions due to dust or mud, and stresses unknown in stationary machinery, all combine to provide the worst of circumstances to which only neglect need be added to ensure early destruction. It is consequently significant that drivers—who are of first importance from this point of view—should be exceedingly capable in their driving capacity and in their knowledge of the intricacies of motor vehicles.

In making my inquiries from municipalities regarding their experiences of mechanical traction, many expressions of appreciation have been given me, such as, "Have given and continue to give every satisfaction," "Tractors very satisfactory in every way," "Has proved to be a great economy and convenience, especially for long journeys and in street watering," "If worked night and day a pronounced success," "By carefully selecting work cartage costs reduced about 40 per cent," "Answers its purpose admirably," "Efficiency the main object, and I think that has been obtained," "Wagon does work of three or four horses," "There is no doubt about the advantage of these vehicles over horses."

It has also been found by private firms and haulage contractors, after many years of experience, that it is far more profitable to work mechanical traction than horse work, and this alone, from a financial standpoint, is conclusive evidence of the superiority of motors in this respect from a contractor's point of view.

In some cases the councils purchase the machines outright, and assume full responsibility for maintenance and running costs, but in a few cases arrangements have been entered into with contractors on a mileage basis.

I believe the Brighton Guardians, for instance, have in the past hired motor vehicles at the rate of 6d. per mile. This rate, however, is being increased to 9d.

The borough of Chelsea have hired from the Leyland Company a vacuum gully emptier.

The vehicles in use differ considerably as to the means by which they derive their motive power, such as steam, petrol, electricity and petrol-electricity. Each of them has its advantage and disadvantage when compared with the others, according to the particular kind of work required to be carried out.

The question of whether steam, petrol, electric or petrol-electric vehicles should be adopted still remains open. The first named has done, and continues to do, excellent work, and the tendency to fit rubber tyres to the wheels is becoming more customary. Petrol vehicles have a large following, and still meet all expectations. As regards electrical machines, the type naturally recommends itself to those responsible for electricity departments, partly because they are specially conversant with its principles, but particularly because, intelligently applied, it can be utilised to equalise the load at the power station, and becomes a profitable consumer. Again, in connection with such work as the removal of refuse, the electric vehicle has strong points. Thus, for instance, in Paris a large fleet of heavy electric lorries is employed for refuse removal, the power required for charging the batteries being obtained from the destruction of the refuse itself, and consequently in a sense is available without charge for fuel.

With reference to petrol-electric vehicles, these are being used to a great extent in connection with omnibus companies, and to some extent by municipalities, and I believe give satisfaction. The electricity is derived from a petrol-driven engine.

In the Royal Automobile Club's trials in 1907 it was shown that excellent results were obtained from petrol vehicles up to 3 tons capacity, but for heavier loads steam had the advantage.

The following are a few of the better-known points in regard to each kind of vehicle, illustrating to some degree the advantages and disadvantages which it is advisable to note.

STEAM.

Substantial and simple in construction, easily worked.

Reserve of power, which is useful on a steep gradient or bad road.

Only in rare cases is it impossible to complete a journey with this kind of machine through breakdown.

Heavier, owing to weight of boiler and storage of coal.

Not available at short notice, as it takes about sixty to seventy-five minutes to get up steam.

While standing there is a wastage of fuel, as steam must be kept up, and the driver, in addition to the machine, is standing idle.

A supply of water is necessary to be at hand, as

it is only possible for this vehicle to run between 15 and 20 miles.

Boilers require to be washed out weekly, and sealed occasionally, thereby losing at least one day's work each week, in addition to about one hour per day (getting up steam).

Two men required to work the vehicle (driver and stoker).

The former must be an engineer.

Annoyance from steam and noise, vibration, projectiles, and consequent complaints.

Oil troubles and quick-wearing bearings from leakage of steam into oiled parts.

Heavy price of coal in this district.

PETROL.

Speedy, and can be turned out at shortest notice.

Quieter running.

Only one man required to drive.

Easier wear on tyres than steam vehicles.

Self-contained.

Not as simple in construction, more easily damaged, and running costs increased by careless driving.

Can be used to best advantages over long distances.

Running costs are increased where continually stopping by wastage of fuel, unless engine is stopped, and strain in starting on working parts.

Slow driving a disadvantage in many ways.

ELECTRIC.

Mechanism simple in character.

Only one man required to drive this type of vehicle.

Quietness in travelling.

Reduced fire risks.

Suitable for short distances, as the constant stopping and starting of the vehicles causes no wastage of power or straining of mechanical parts.

For certain service, where the stopping distances are comparatively short and frequent, electric vehicles are found to be cheaper to operate.

Easy wear on tyres and vehicle.

Use of our electricity.

Speed slower.

In considering this type the least size of battery to obtain efficiency because of weight is an important point.

If battery is run down through oversight, damage might be done to cells, and vehicle might also be left stranded.

PETROL-ELECTRIC.

This is a machine where a petrol engine is engaged to drive a dynamo which provides power to electric motors fitted in connection with the back wheels of the machine.

Can be turned out quickly.

Moderately easy wear on tyres.

Only one man required to drive.

No strain in starting on working parts.

Greater speed than electric vehicles.

Requires a driver with knowledge of this type of vehicle.

Quick in running.

Generally more complicated in construction and design.

In the employment of the whole of these vehicles there seems to be still room for progress in the type of bodies for various classes of services, and also as regards quick loading, although I believe considerable attention is being given to the design of side, end-tipping and interchangeable bodies, and considerable improvements have been and are being made.

I may here mention that there are prospects at the end of the present crisis of further developments in respect to variety and standard of machines to be engaged in municipal work.

It is necessary here to deal briefly with a few of the points previously noted.

In respect to the steam vehicle some of the makers say it is only necessary to have one man for driving, and that an assistant is unnecessary. Also that the boiler need only be washed out once in twelve days, and that it is quite possible to obtain the necessary steam from coke fuel.

These statements are open to considerable argument, and, if assuming the second man is necessary, an outlay has to be made without any equivalent advantage.

It is only possible for a steam vehicle to run from 15 to 20 miles with one fill of water, and it is therefore easy to assume that the driver may misgauge his distance and find himself stranded.

Adverting to the petrol vehicle, the makers inform me that the wastage of fuel during stoppages can be easily lessened by running the engine on a smaller carburetter jet, an improvement they are now effecting in lorry chassis. Also, having regard to the high price of petrol, it is possible for a vaporiser to be fitted, so that the engine can be run on a lower grade, or heavy spirit.

With reference to the electrically driven vehicle, the question of battery is of great importance, and requires to be very carefully considered in conjunction with the item of cost of current and adaptation or provision of plant or cable. Acc. and wastage in voltage. (Electrical firms base their estimate of an "all in" current cost of 1d. per unit.)

I have not deemed it advisable to make any allowances in my figures for the above-mentioned eventualities, and have assumed current price at 1d. per unit.

As to the petrol-electric vehicle this has not yet been very widely used among municipalities, but Tilling-Stevens, Limited, have tendered for such a vehicle, and I believe omnibuses, lorries and mail vans owned by T. Tilling, Limited, are of this make, and are driven with very satisfactory results.

In regard to the running costs of the four vehicles there seems to be very little difference.

The electric vehicles in the first case are exceedingly dear; with the steam, petrol, and petrol-electric vehicles taking second place, the running costs in the three last cases, so far as can be gathered, are slightly more. The electrical vehicle may have an advantage in this matter if the "all in" price of current can be guaranteed not to exceed the price mentioned above delivered in the vehicle at the requisite voltage with a full unit.

Tyres.—Regarding this subject steel tyres are more generally used for heavy steam vehicles travelling up to a speed of about 8 miles per hour, but with a vehicle of lighter tonnage travelling 12 miles per hour and upwards the consensus of opinion is that rubber tyres are a decided advantage. They are much faster, which reduces the running cost, and, by the resiliency of the rubber, effects great saving in the wear of the chassis from vibration, which must mean much longer life to the vehicle. The noise is also eliminated, and the cost, taking all things into consideration, is very little more than steel.

Statements of running costs and comparisons between motors and horses are often misleading unless due consideration is given to local conditions. It is necessary to take into one's calculation the cost of labour, coal, petrol, and horse hire in the particular locality, also the nature of the work to be done and conditions under which it will be carried out. Some drivers will use 50 per cent more coal, oil, &c., than others in doing the same amount of work, and the wear and tear as well as the work done will vary considerably according to the varying capabilities of the men employed.

The method by which the machines are purchased should also be before you, in order that due weight be given to the capital charge.

The figures obtained from other towns must not therefore be taken with any great amount of reliance as being applicable to this district, although they serve to give an idea of what the costs might be should the council adopt mechanical traction.

It is clear from the published statistics that motor vehicles have been adopted to an unexpectedly satisfactory extent by local authorities for miscellaneous services, such as sweeping and watering of streets, the removal of refuse, haulage, &c., and the fact seems now to be clearly established that in services of this sort, in the great majority of districts, motors show a better economy than horse haulage, and this irrespective of the subsidiary advantages of being able to complete a given piece of work in a shorter time, with the consequent power of selecting the most convenient hours for any particular work and frequently duplicating the employment of a motor by providing alternative bodies for it.

I have gathered information from a large number of authorities, which I herewith place before you as follows:

Acton Urban District Council.—There are no motor vehicles on municipal work in the Acton district. The only work carried out to some extent by mechanically propelled vehicles is the collection of house refuse. This work is executed by team labour and a light hauling engine. The refuse is collected from door to door in large vans drawn by horses, and the vans are taken up in pairs to the dust destructor with an Aveling & Porter hauling engine. This has been found to be an economical arrangement, the long-distance hauling being done by motor vehicles, and the short journeys,

with constant stopping and starting, is executed by horses.

Aldershot Urban District Council.—One 5-h.p. steam watering wagon, convertible for haulage.

"Five tons carrying capacity. In the summer a 600-gallon tank is placed upon the chassis for watering purposes. In the winter this is removed and the vehicle employed for the collection of house refuse. The vehicle pays in both respects, while the cost for horses remains at 12s. 6d. per day, but at the old figure during the pre-war period of 7s. 6d. per day the vehicle would not show a satisfactory financial return, and I am not quite sure that it is my council's aim. Efficiency is the main objective, and I think that has been attained."

Anglo-American Oil Company, Limited.—The Yorkshire Commercial Motor Company have supplied this firm with wagons, who say:—

"The wagons have a nett load capacity of 4 and 3½ tons respectively. The all-in running cost is from 20s. to 24s. per day, and the vehicles travel an average of 50 miles per day."

They also state these are the cheapest things the firm have ever had.

Anglo-American Product Company, Limited.—This firm have steam wagons which were supplied by the Yorkshire Commercial Motor Company. Registered tare-weight 4 tons 19 cwts. The wheels are cast-steel with rubber tyres, which have been found more satisfactory both from the maintenance point of view and in running than steel tyres. The front tyres are 850 mm. by 160 mm. Back tyres (twin) 1,050 mm. by 160 mm. The all-in running cost is 1s. 2d. per mile, which is on the high side, but the reason is owing to high wages, also high cost of fuel and oil. They consider the life of the wagon ten years, but for depreciation costs allow eight years.

Barrow-in-Furness.—One 30-35-h.p. (3½ tons) petrol watering wagon and tank.

"Most serviceable. Cost about £750 complete. Solid rubber tyres, preferably single 120 mm. at the front, and twin 120 mm. at the rear. Although not more economical than horses for street watering, this type of vehicle is found to be more convenient, and the convenience is worth the slight extra expense. With regard to running costs everything depends upon method of loading, length of journeys, and whether loads can be run each way. Petrol-driven wagons should not be used for distances under 1 mile. Consumption of fuel also depends on work done, but for a 3-ton 30-h.p. wagon about 35 gallons per week. Life of such a wagon about seven years. Life of tyres approximately some 10,000 miles for rear tyres and perhaps slightly more for front tyres. For the work of general haulage there is no doubt the petrol-driven wagon is cheaper than team labour where distances covered are over 1 mile, but not where frequent starting and stopping and slow loading are necessary."

Bedfordshire County Council.—Petrol motor lorries.

"Haulage of material over long distances 3·93d. per ton-mile."

Birmingham.—Two steam wagons used for moving road stone.

"Capacity about 5½ cub. yds. 5 tons. Cost £580, including 1,000-gallons interchangeable water tank (£90). Make—One by Messrs. Aveling & Porter, one by Messrs. Fodens, Limited. Makers' Standard type; iron tyres. Cost not ascertained, but approximately 9d. per mile."

Blackpool Corporation.—"With regard to the actual saving effected by the vehicle it will be difficult to ascertain until we have the figures for a full season's working; but, although we have only had the vehicle at work since the last week in July, what it has accomplished in this period has convinced me that it will prove a great saving to the department, as the work it can perform during an ordinary day of nine hours is really marvellous. It has already displaced six horse-drawn watering vans, while in connection with the washing of our promenade it has released four men for other work, which is, of course, equal to saving of four wages for this class of work alone.

"Taking an average day of nine hours, the vehicle waters 48 miles of streets, using twenty-four loads, or 18,000 gallons of salt water. The ampère per mile; while the current used in charging, at 5 ampère-hours per unit, is approximately 70 units. The tank has the advantage of being cylindrical in shape, and, having a capacity of 750 gallons, it is capable of watering a good distance before it requires refilling, which takes from five to ten minutes to carry out, according to pressure.

"The usefulness of the vehicle is not limited to the watering of streets, as it has already accomplished good work in connection with the cleansing of sewers, as, with a flush of 750 gallons, we are in many cases saved the trouble and expense of having to resort to dredging operations, which are both slow and costly.

"The vehicle is also used for the washing of streets in conjunction with our motor-sweeping machine, which follows along after the electric vehicle, both machines travelling at the same speed. Only half the usual quantity of water is used, while the work is done better and quicker.

"This street-sprinkler is equipped with a standard 3½-ton 'G.V. Electric' chassis and an 'Ironclad' battery. The battery is charged from the electric plant at the refuse destructor. The tank is made removable, so that, when the sprinkling season is over, a van body may be put in its place and the vehicle used for dust collection or other purposes."

Bradford.—This corporation have a petrol lorry, used for permanent-way work (3-ton capacity), the running cost of which, including petrol, lubrication, tyres, maintenance and depreciation, works out at 7·8d. per mile.

Also a steam lorry, 4 tons 19 cwt. load capacity. No record has been kept of the running cost of this vehicle.

Bristol.—Petrol vans (sweeping machines), used for sweeping wood and pitching; 4-cylinder, 10-12-h.p.; capacity for spraying water, 60 gallons. Cost £638 each (cover for driver extra). Maker—F. W. Archer. Three speeds, one reverse, Ballot engine (French). Solid rubber tyres; wheels, gun-carriage type; petrol per mile, 10 miles per gallon; tyres, £50 per set, guaranteed 10,000 miles. Sweeping machines are easy to handle, and are doing good work.

Two steam vans for general hauling purposes, principally long-distance work. Steam lorries 5 tons 14 cwt. gross weight each; capacity, 10 ft. 6 in. by 6 ft.; 3 tons nett weight each. Cost complete, £545 each. Makers—Yorkshire Commercial Motor Company. 3-ton wagon fitted with mechanically operated tipping gear, 3-speed gear, rubber tyres, and capable of 12 miles per hour; patent Yorkshire boiler, working pressure 175 lb.; solid rubber "Avon" tyres. Fuel, 1s. 8d. cwt.; steam coal per mile, 1 gallon cylinder oil and 1 gallon engine oil per 50 miles. Machine complete, with driver, fuel, &c., charged to works at rate of 25s. per day to cover all expenses and depreciation.

Sweeping machines—Cost per tyre about £11. Maker's guarantee for 10,000 miles.

The lorries and sweeping machines have only been in use for six months, consequently the engineer is unable to give at present any very reliable information regarding maintenance and repairs, which, of course, could be obtained after a more protracted use.

Burton-upon-Trent.—One steam wagon, carrying 4½-ton load.

"Capital cost £614. Used only to convey clinker from refuse destructor to sewage farm 6 miles away; in conjunction with its use a screening and elevating plant has been erected at a cost of £480, and the total annual working expenses, including repairs, amount to £490. Average cost of haulage only is about 6d. per ton-mile, but inclusive of screening, elevating and loading 9d. per ton-mile, including capital charges. We have had this plant now for about ten years, and I have no figures of the cost of doing the same work by horse-vehicles applicable at the present time. Usual cost of haulage by horses is about 1s. per ton-mile."

Chelsea.—Sixteen 40-h.p. steam wagons.

The experience of twenty years has shown that about 40-h.p. is required for an efficient municipal motor van, and a price of £550 is not excessive. Motor vans have been used in Chelsea for municipal purposes since 1900. In all cases the vehicles were purchased out of current revenue, and not by means of a loan. A Leyland vacuum tank has been hired from the makers since 1911 for cleaning out street gullies. Average annual cost of maintenance has diminished from over £60 in 1900 to £40 in 1906.

Average total cost per annum for each motor dropped from £254 (1907-8) to £194 (1913-14).

Cost, less wages of driver, &c., £95 (1907-8) to £77 (1913-14).

Average cost of collection of house refuse by horses and vans for six years, 1901-7, 4s. 9½d. per ton.

Average cost of collection of house refuse by motor vans for four years, 1910-14, 4s. 6d. per ton.

Cost of two motors used for removing house refuse during last three quarters of 1914:—

Motor No. 1. Dust collected average 6 tons 3 cwt. 1 qr. per day.

Cost per motor only, 8s. 9d. per day.

Motor No. 2. Dust collected average 5 tons 8 cwt. per day.

Cost per motor only, 7s. 8d. per day.

Chiswick. Two steam vans used for all purposes.

Eight hundred and fifty gallons capacity water vans: slop vans, 11 cub. yds.; lorries, 11 cub. yds. Cost £655 each, with special vacuum gully emptying apparatus. Maker—Yorkshire Commercial Motor Company. Water vans, iron rectangular tanks; slop vans, sheet-iron well body, 4 ft. 6 in. total height. Lorries, used as lorries with false bottom. Tyres, Avon India Rubber Company, Limited.

It is impossible to give information as to running cost owing to short service, but approximate consumption of fuel is 1 cwt. of coke and 1 cwt. of coal per day on an average of 30 to 35 miles. In addition to body being used for above purposes, it has been provided with a patent vacuum emptying apparatus, a steam jet creating the necessary vacuum, and this has been found fairly satisfactory. Council lets vehicle on hire; resulted in a fair return.

Denbigh. One 5-ton tipping wagon with interchangeable iron tank (1,000 gallon capacity) to fit inside of body, and fitted for street watering and sewer flushing. (Foden—steam.)

"It is used for street watering, sewer flushing, and haulage of macadam and other materials for road repairs. I do not think there would be any saving in the employ of these vehicles for collection of house refuse, &c.—they pay better in long runs than short ones."

Deptford. Petrol-motor sweeping broom.

The cost for one year's working, from February 22, 1915, to February 21, 1916, is as follows:—

Number of days worked, 289. Average mileage per day, 27·78. Average consumption of petrol 3·55 gallons per day, and 7·83 miles per gallon. Lubricating oil, 1 gallon to 175 miles. Axle grease, 1 lb. to 41 miles.

Cost of working the machine for the year stated, including depreciation at the rate of 12½ per cent, is £396 7s. 1d., which is equivalent to 6s. 2·84d. per mile on roadway sweeping.

The cost of the same work had it been performed by horses and horse brooms would have been £665 14s. 3d., or 10s. 5·7d. per mile.

The report specially mentions that during the slight snowfalls in last November the broom was invaluable, and this information is taken from a report which was presented by the borough surveyor to his Works Committee.

Derby.—Steam lorry used for highway work and coal carrying.

Capacity, 10 ft. by 6 ft. by 3 ft.; 8-10 tons, with trailer. Cost, £565. Make, Fodens, Limited. Steel locomotive type; boiler, 70 sq. ft. heating surface. Compound engine. Seasoned-timber body. Driving wheels, 3 ft. 6 in. diameter by 12 in. Front wheels, 2 ft. 9 in. by 6 in. Machine is not in use.

Ealing. Two 25 h.p. (5 tons) steam wagons; trailer, 3 tons.

"For street watering and general haulage (unless gradients are very steep) I consider each lorry supersedes 3 to 3½ horse-drawn vehicles. Should roughly say that, including repairs, depreciation, driver's wages, fuel, &c., the costs amount to about £1 per day."

East Ham.—"I have only one motor vehicle—viz., Mann's combined tractor and roller, which I find most useful for repairing trenches opened by gas company and water board, as I am able with this machine to carry material for repair work and at the same time being provided with the roller for rolling in material. A water-tank can also be interchanged with this machine, but I have not at present had the opportunity of using same, as it is fully occupied on trench work. The cost of the machine was £610.

"The wages paid to the driver is 43s. per week (forty-eight hours). When repairing trenches an additional man goes with him. The running cost for coke, waste, cylinder oil and engine oil is about £1 2s. per week."

(To be concluded.)

A Boiler Experiment. As an experiment the London County Council is altering some of the boilers at Greenwich generating station, so that a cheaper class of coal may be burned. Last year the coal cost £75,000 more than the year before.

MUD AS A BUILDING MATERIAL.

To the Editor of THE SURVEYOR.

SIR,—I see much interest has been aroused in England in the subject of mud huts, of which the military authorities are said to have built a number. One writer in a recent issue of your journal states that one drawback of a mud wall is the difficulty of rendering the outside surface proof against driving rains and damp atmosphere, as it is difficult to make lime plaster adhere to a mud wall. Apparently, the secret of success in the construction of mud huts lies in the selection of suitable earth. On the West Coast of India, not only huts, but also large dwelling-houses, one and two storeyed, are built of mud, and until recently mud entered largely in the construction of even public buildings.

The method of construction in buildings of greater pretensions than a hut is as follows: The foundations, the corners of the building, the jambs of doors and windows, the sills of windows, and also arches over openings are built of blocks of laterite, which is a ferruginous sandstone. A course of these blocks is also laid at floor levels and at roof level. The rest of the building forming the major portion of the wall area is constructed of mud. The walls are about 18 in. thick, and are run up vertically in layers 2 ft. high between the laterite stone quoins which serve as guides. The walls are then plastered in the usual way with stone or shell lime mortar. The mortar adheres to the mud surface quite as firmly as it does to the laterite surface. There are buildings constructed after this manner which are a century old, and not a few much older. Huts are built entirely of mud, and they are coated both inside and out with a coating of the same earth rubbed down with a wooden float. The surface is then smeared thickly with dung of cattle reduced to a semi-liquid state with the addition of water, and is then rubbed down with a smooth piece of stone. A mud wall so treated stands the heavy south-west monsoon, which lasts three or four months in the year, and precipitates from 100 to 150 in. of rain on this coast. With three coats of limewash on a mud-plastered wall, prepared as described above, it will present as neat an appearance as any wall rendered with a rough coating of lime plaster.

It is believed that the dung hardens the clay surface and renders it impervious to rain and damp. The practice of smearing mud floors and walls with dung of cattle is common throughout India, and even concrete floors are so treated in native houses.

The material used for walling on the West Coast of India, referred to above, is a natural red earth of a very gritty character, with a preponderance of argillaceous matter.—Yours, &c.,

HORMUSJI NOWROJI,
B.E., ASSOC.M.INST.C.E.

Madras.
August 24, 1916.

THE BRITISH DECIMAL SYSTEM.

To the Editor of THE SURVEYOR.

SIR,—We are told that, to save our trade, regain lost ground, and inaugurate the Millennium, we ought to scrap every standard unit we possess in weights, measures and currency, except the pound sterling and the florin, and go in whole-heartedly for decimals in every walk of life, adopting the metric system, and a decimal currency of 1,000 cents to the sovereign. We are told that we possess the most awkward, clumsy, undesirable systems on earth, that we lose time in education, in accounting, in summing, in calculation, and generally that we are in a most hopeless situation of muddle and mess. As is always the case in a crisis, the national attention is being drawn away from the incompetence of legislators. The "system" is to blame, not the "leaders," who never took the trouble to learn that system, and correctly to apply it.

It is not generally known that Gunter's chain is directly derived from the old Belgic yard of 39·6 in., or 5 links, and that the cube of this ancient yard of water at freezing point weighs exactly 2,240 lb., the British ton. We therefore possess already a metre and a metric ton, and we do not need any other. As a matter of fact and history, the French metre is a modern reconstruction of the old Belgic yard and

the *Système Usuel*. The French metre is therefore an approximative modern substitute for a measure which is certainly older than the Great Pyramid—that is, 4,000 years or more.

A metre of 39·6 in. is 1 yard and the tenth of a yard; the metric ton is 2,240 lb.; 50 kilos. make 1 cwt., and 1,000 kilos. a ton; 9 gallons equal 40 litres; and 1 bushel is 36 litres—all British units, of course. Everything which can be said in favour of the metric system is equally applicable to the British decimal system (the B.D.S.). Further, every French constant and formula can be used in the B.D.S. without alteration, correction, or error. A design can be calculated and drawn in the B.D.S. from either British or French data, and its dimensions will be equally correct and in proportion, and quite safe and accurate, whether stated in terms of the metre of 39·6 in. or the metre of 39·37 in.

It is open to every business or professional man to employ the B.D.S. without waiting for an Act of Parliament, and to try for himself what a change over to the metric system really means, while still leaving his line of communication and of retreat to the old position open in case of necessity. The adoption outright of the metric system means burning all British boats and bridges behind.—Yours, &c.,

E. A. W. Phillips, M.Inst.C.E.,
Author of "British Trade and the Metric System."

Rawdon House,
Aymer-road, Hove.

THE BRITISH DE-TINNING SCHEME.

The British De-Tinning Company, of 75 New-street, Birmingham, ask us to state that a clear notice of fourteen days will be sent to the numerous engineers, surveyors, and members of local authorities who have already intimated their decision to be present at the forthcoming conference to be held in London. Should the conference be delayed beyond the end of this month it will merely be with the idea of making possible and convenient the attendance of representatives from Russia, France, Italy, &c., as the company have already had communication from these countries on the subject.

It is also interesting to note that representatives of the Canadian Government who visited this country a few weeks ago, and who interviewed the company, gave the scheme their hearty approval, and have promised to commence operations at once in Canada. In our next issue we hope to publish plans of the new de-tinning works being erected in Southwark borough. The company also propose to put machines in operation at the conference meeting and have them worked by partially disabled soldiers or sailors. The object of the founders of this scheme is to find employment for such men, and once the scheme is operative it would provide employment for several thousands. The British De-Tinning Company's processes are claimed to have special advantages over the German system, inasmuch as the quantity of chemicals used is reduced by 75 per cent; further, those who are interested will be in the happy position of knowing that the work can be carried on successfully on commercial lines, independent of any material and plant from Germany.

The utilisation of waste paper, it may be mentioned, is another matter to which the company are giving attention, and samples of the products from this material will be shown at the forthcoming meeting. We understand that some 4 acres of land have been acquired in connection with this branch of the company's activities.

Scandinavia and Summer Time.—The Copenhagen correspondent of the *Daily Telegraph* states that the experience of Denmark and other Scandinavian countries with respect to the operation of the daylight-saving measure is deemed to be far from satisfactory, as it has not decreased, but largely increased the consumption of electricity and gas, as it is now dark at a time in the morning when the majority of people have to get up, especially the agricultural classes. Many people in the country have reverted to the old time. This also applies to school children, in order that they shall not have to get up in the dark. It is very uncertain now whether Scandinavia will adopt summer time next year.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Must not the water which is supplied to Whitborough, in the parish of Kingskerswell, Devonshire, be of a peculiarly accommodating nature when we read in the *Western Times* that at a meeting of the Newton Abbot Rural District Council a member stated "that the water was good, except on occasions, when it was contaminated, as it was on occasions"? Is not this water supply of the same nature as the little girl who had a little curl right in the middle of her forehead, and when she was good, she was very, very good, but when she was bad, she was horrid?

* * * *

Of surveyors' multifarious duties, are there any limits? What will Mr. Dolamore, the borough engineer of Bournemouth, say to his new appointment as ship's husband to the corporation dredger? Knowing what "husbands" have sometimes to put up with, would not an appropriate song for Mr. Dolamore be "Rocked in the cradle of the deep"?

* * * *

Why did not Mr. Lloyd George consult the St. Asaph Rural District Council before opening a new hut for soldiers at a place called Kinmel? When we read in the *Liverpool Daily Post and Mercury* that the chairman of the council said "he did not consider that even Mr. Lloyd George had the right to open a building before the plans as to drainage have been passed," and that he should be written to at once to ask him by what right he had done so, do we not all tremble for our patriotic and invaluable War Minister when we learn that this council is on his track? Should we not all rally round him and protect him?

* * * *

Where can one easily find statistics of the number of motor cars in the United Kingdom similar to those recently published in our American contemporary *Good Roads*? Is it not interesting to read in a recent issue of that paper that in 1915 there were 2,455,664 motor cars in the United States, and that they contributed nearly 7 per cent—presumably by taxation—"of the money spent on account of building rural roads and bridges?" What is the percentage derived from motor cars in the United Kingdom for similar purposes?

* * * *

Should not Mr. Robert Doughton, of Aberystwyth, feel proud that his name is to be handed down to posterity in the company of such classical heroes as Nero, Agrippa, Pliny, Ptolemy, and others, when we find that the town council of Aberystwyth are about to christen a new swimming bath at Castle Point "Piscina de Robert Doughtonia"? Why is it that some people are fortunate enough to have honours thrust on them?

* * * *

According to a recent issue of the *Contract Record*, of Toronto, that city appears to be between the devil and the deep sea; in other words, it "is still wrestling with the old and vexing question . . . whether it is better to hand over the construction of the various city works to the mercy of villainous contractors, or to run the risks attendant upon the indifferently efficient system generally evidenced in municipal operations." Does this mean that the municipality of Toronto can neither trust contractors nor their own staff, or is it, as darkly hinted by the *Contract Record*, that they can't trust the aldermen and councillors?

* * * *

Is there any deduction to be made from the following figures, given in *The Engineer*, with regard to the number of students who passed through the Engineering Schools of the United States during the year 1915?—Mechanical engineering, 7,751; civil engineering, 7,182; electrical engineering, 6,637; general engineering, 6,059; chemical engineering, 2,387. Does this show that mechanical engineering is more popular as a profession than civil engineering, and had the large number of students in chemical engineering—which it is stated was far above the average—anything to do with the boom in chemical engineering which is sure to take place in connection with scientific road construction in the future?

* * * *

Is it not rather interesting to read that no fewer than 2,000 reinforced-concrete bridges have been built in this country during the past twenty years? What have the Local Government Board to say to

The Surveyor
And Municipal and County Engineer

this, and will they now extend the period for the repayment of loans for this description of work?

* * * *

What is going to be the effect on locomotion if the price of petrol rises much higher and the supply is further restricted by the Government? Will the withdrawal of omnibuses and taxicabs from our streets cause the reappearance of the ordinary "push-bike," and shall we not all be obliged to employ "Shanks's mare" more than we have done lately? How is this war going to affect peoples habits, if it lasts for another two or three years?

SURVEYORS' PETROL ALLOWANCES.

CONTROL COMMITTEE STATEMENT.

We are officially informed that the question of the allowances of petrol to assistant county surveyors is at present engaging the attention of the Petrol Control Committee. It is not possible, however, at the present moment to grant any increase to those who use cars, except on the recommendation of the Road Board, but in certain special cases the committee are prepared to reconsider the allotment to those surveyors who use motor cycles.

Mussel Purification Tanks at Conway.—For some years the sale of Conway mussels has been prohibited, owing to the risk of their being polluted by sewage. A grant of money by the Board of Agriculture and Fisheries has enabled the Conway Corporation to erect a purification works on the land abutting upon the foreshore, just above the tubular railway bridge. Here the mussels taken by the local fishermen from the bed of the river are to be brought, placed for forty-eight hours in sterilised sea water, and so freed from all contamination. Thence the mussels, with a certificate of purity, will be sent to the various markets. The borough engineer, Mr. F. A. Delamotte, from whose designs and under whose supervision the purification tanks have been constructed, reported at the meeting of the council, on Tuesday, the *Liverpool Post* states, that the process of purification had been proved practical and efficient, and that four tons of treated mussels were placed upon the English market on the 2nd inst. With the exception of one or two very minor alterations, the plant was quite satisfactory. Mr. Delamotte added that he hoped that 80 to 100 sacks of mussels would be dealt with three times a week. In their experiments the investigators had succeeded in sterilising mussels in three hours, but it could not be done so quickly with the mussels in bulk, though the process might be accelerated with experience of the working.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRY HELD.

Blackburn T.C. (August 30th. Mr. A. G. Drury).—£71,568 for extensions and improvements at the Greenbank gasworks. The town clerk, Mr. Lewis Beard, stated that in 1913 a serious stoppage occurred, and one result was that the corporation became convinced of the necessity for the complete reorganisation of the gasworks. There were two gasworks—Addison-street, in the centre of the town, where there were no railway facilities, and at Greenbank, where there were excellent railway facilities. At Addison-street there were horizontal retorts and a water gas plant, and at Greenbank there were inclined retorts, which had not proved a success. The new scheme was for the construction of vertical retorts at Greenbank of a capacity of 3,000,000 cub. ft., with the necessary subsidiary plant, and supplemented by a tar-distilling plant to produce materials for the Ministry of Munitions and raw material for the manufacture of dyes. In ordinary times this scheme would be one that would be welcomed, and would be sanctioned as a prudent, well-thought-out, efficient, and economical scheme. Of course, now they had to consider the very special circumstances of the time, and in everything they had to look to the war first and last. The reconstruction scheme, if sanctioned, would liberate sixty men, some of military age, and the others could be usefully employed on munitions. Important economy would be effected in the matter of fuel, and among other things they would produce for sale 38,000 tons of coke, instead of 28,000 tons, as at present. The demand for coke was enormous. If the scheme was not sanctioned, the alternative would be a temporary arrangement which would cost thousands of pounds, and would only be of a makeshift character. As it was, they would have to scrape through this winter as best they could. Mr. A. Morton Fyffe, gas engineer, author of the scheme, said the scheme, which was absolutely necessary, would, it was estimated, effect a saving of £10,000 to £12,000 annually.

APPLICATIONS FOR LOANS.

Ayrshire C.C.—£460 for improving the Kirkoswald water supply.

Batley T.C.—£25,000 for new carbonising plant at the gasworks.

Nelson T.C.—£3,800 for a benzol plant and rotary washer scrubber at the gasworks.

Sheffield T.C.—£1,000 for the completion of the King Edward VII. Hospital.

Westhoughton U.D.C.—£8,757 for a housing scheme.

LOAN SANCTIONED.

Horsham R.D.C.—£2,500 for the purchase of the Billinghurst water supply.

FORTHCOMING INQUIRIES.

SEPTEMBER.	£
19.—**Hindley.** For the provision of a humus tank at the sewage works (Mr. P. M. Crosthwaite)	760
20. **Droylsden.** For the provision of a humus tank at the sewage disposal works (Mr. P. M. Crosthwaite)	1,751

Chair of Engineering for Aberdeen.—By the death of Mrs. William Jackson, widow of Mr. William Jackson, Thorngrove, Aberdeen, which occurred on the 1st inst., a large sum will become available for the establishment of a Chair of Engineering at Aberdeen University.

Profits from Waste Paper at Preston.—The Preston Waste Paper Committee have divided £300 among local war charities. The accounts for August showed a cash balance of £109, and of this £80 was voted to the Naval and Military Pensions Fund, making a total to this fund of £230.

"Surveyor" Readers' Gifts to a Labour Battalion.—Subscribers to the fund which was recently opened in these columns with the object of providing the men in one of the labour battalions at the front with an accordion and some sets of quoits will be glad to know that these articles duly reached their destination, and, Captain Cadic informs us, are very greatly appreciated by the recipients.

The Extent to which Sewage can be Purified by Practicable Methods of Artificial Treatment now in Use.*

By HARRISON P. EDDY, Boston, Mass.

(Conclusion.)

The oxidising power of all bacterial agencies depends upon an ample supply of atmospheric oxygen. This must be absorbed by the bacterial jelly of the contact-bed, mainly during the rest period, which is limited to a fraction of the operating cycle, rarely exceeding three-quarters of it. The quantitative efficiency of the contact-bed is low also, because of its limited capacity for the storage of sewage in contact with the bacterial surfaces. These limitations have led to efforts to devise beds which would accomplish similar work without being subject to such restrictions. The most important derivative of the contact-bed is the trickling filter.

Like the contact-bed, this filter is composed of coarse-grained particles, the most popular size at present perhaps being 1½ in. in longest dimension. The thickness of the beds varies from 5 to 10 ft., and their shape depends upon the method of distribution or local conditions of controlling importance. The stone is placed upon concrete or vitrified-tile draining floors. The sewage is distributed as uniformly as may be over the surface of the bed, by revolving arm sprinklers, distributors moving backward and forwards, spreading the sewage as they go, or fixed pressure nozzles which spray the sewage, distributing it in a manner similar to that of the ordinary lawn fountain. Where the fixed pressure nozzle is used it is generally operated under a head diminishing throughout the discharge period from a maximum of about 7 ft. to the minimum, which varies from 1 to 2 ft. The dosing cycle may consist of a five minutes' dosing period and a ten minutes' rest period.

This fluctuation in head may be obtained by a butterfly, or undulating valve, rotated in the supply main, or by dosing tanks so designed as to provide the proper quantity of sewage at each head.

When sewage is first applied to a new trickling filter the suspended matter clings to the surface of the stones, where it is temporarily retained, forming a suitable habitat for the bacteria present in the sewage. Thus a bacterial film, sometimes called bacterial jelly, is gradually built up, covering the surface of the stone of the entire bed. As the sewage trickles over this jelly-like substance, the finely-divided colloidal and some of the dissolved matter is retained upon and in it, and apparently furnishes the food supply for the myriads of micro-organisms present. In this manner the sewage is deprived of its putrescible organic matter, which is gradually worked over by the organisms and ultimately given off to the passing sewage and carried away in the form of mineral or stable organic substances. It is of vital importance to provide the proper quantity of food supply, and an ample opportunity for the absorption of atmospheric oxygen. The operation of the filter is approximately continuous, and thus has a distinct advantage over the contact bed, which of necessity is both dosed and aërated periodically. A typical section of a trickling filter is shown in Fig. 4.

A very highly efficient trickling filter will carry the process of oxidation so far that the effluent will keep indefinitely, and if the contact material is relatively fine, the suspended matter of the sewage and the colloidal matters withdrawn therefrom will be retained and a practically clear and sparkling effluent will be produced. Such a filter will cause a large reduction in the number of bacteria present in the original sewage. Trickling filters are ordinarily built of coarse stone, however, and contain interstices so large that the suspended matter which accumulates temporarily passes away after having been more or less completely worked over by the organisms. Such effluents are turbid and contain settling solids which are commonly removed in secondary sedimentation tanks. In fact, one of the primary objects in the design of trickling filters is to so construct them that the solids shall not accumulate indefinitely in the stone, but may wash out from time to time, and thus avoid the necessity of taking out the stone to free it from the accumulation of such substances which otherwise might ultimately clog the filter. It is necessary, therefore, under ordinary conditions, to accept turbidity and much suspended matter as characteristics of the effluent from this type of filter, and to provide for the removal of the settling solids before its discharge into the diluting waters.

The underdrainage system of the trickling filter is of great importance, since it is necessary to convey the effluent away freely, and also to provide ample means for washing out humus when the bed discharges its accumulation. Many types of filter floor have been used for this purpose. The one used at Fitchburg, Mass., consists of a series of channels cast in the concrete floor, spanned with concrete beams or "bricks," the whole being covered with cobble stones before the filtering material was placed.

The walls of such a filter, if below the ground level, need be hardly more than diaphragms to prevent the material of the filters from mingling with the adjoining earth, and to keep the sewage or effluent from escaping into the soil. Such a diaphragm wall, built by plastering reinforcing steel with mortar by means of the cement gun, was employed at Fitchburg, and is shown in Fig. 5.*

SAND FILTERS.

The intermittent sand filter is one of the oldest devices for the artificial treatment of sewage. It consists of a bed of sand from 3 ft. to 5 ft. in depth, enclosed within embankments, and usually provided with underdrains. It is necessary to use a free draining sand if filters are to be capable of handling a reasonable quantity of sewage.

As the name implies, these beds are operated intermittently. They are dosed by completely flooding the surface as quickly as possible, preventing excessive quantities of sewage from penetrating portions of the bed near the distributors, and thus aiding in uniform distribution. Dosing is best accomplished in the smaller plants by storing the sewage until the desired quantity has accumulated, when the dose is suddenly and quickly released by automatic apparatus.

The sewage percolates through the sand, where it comes in intimate contact with living organisms, as in the contact and trickling filters. In fact, the biological processes appear to be practically identical in these types of filters, although the oxidation is usually carried somewhat further in the sand beds. There is, however, one distinct difference between the sand filter and the trickling filter as ordinarily constructed and operated. The former, due to its fine particles and small interstices, retains the suspended solids mechanically, and is thus enabled to produce an effluent which is clear, sparkling and colourless. The trickling filter, as already explained, because of its large interstices, allows the suspended matter ultimately to pass through it, giving to the effluent a decidedly turbid appearance. A well-operated sand filter will carry the oxidation of the organic matter nearly to completion, converting it very largely into mineral substances. The bacterial reduction may also be far superior to that obtained by ordinary types of contact and trickling beds. Effluents, in fact, are obtained in which the bacteria are less than 1 per cent of the number present in the original sewage, a result fully equal to that obtained by ordinary disinfection.

Obviously the retention of the suspended matter upon and in the sand causes a reduction in its capacity, and if this accumulation is permitted to increase indefinitely, the filter will become practically impervious to water. It is necessary, therefore, to provide for the periodic cleaning of the filters, which is accomplished by raking and scraping off the mat remaining upon the surface of the sand after the filter has become dry. Heavy mats necessitate frequent and expensive cleaning, which may be reduced, to some extent, by passing the sewage through sedimentation tanks before it is applied to the filters. It is usual, therefore, in such installations to combine

* Paper read before the Engineers' Society of Western Pennsylvania.

* Courtesy of *Engineering News*.

with the sand filter suitable sedimentation tanks for the removal of the coarser suspended matter.

The efficiency of sand filters, as well as of contact beds and trickling filters, is much lower during cold weather than in the summer. It is necessary to make ample provision for winter conditions, to avoid the freezing of the applied sewage in a solid layer adhering to the surface of the beds. This is accomplished by turrowing or by raking the surface material into piles, so that the ice-sheet may be held above the normal surface, thus providing a natural roof or cover, below which the sewage flows to the various parts of the bed, and which protects the sand from extreme cold and snow.

BROAD IRRIGATION.

It is hardly necessary to discuss here the merits and demerits of broad irrigation, the oldest method of artificial oxidation of sewage upon land. This method has found little favour in this country.

It is capable, under favourable conditions, of producing a very highly purified effluent, fully equal to that of the sand filter.

DISINFECTION.

The methods of sewage treatment thus far described deal primarily with the prevention of objectionable deposits and offensive conditions. Disinfection deals with the destruction of organisms. Normal municipal sewage may be said to contain about 1,000,000 bacteria per cubic centimetre, while they frequently run as high as 10,000,000 or 20,000,000 per cubic centimetre in old and strong sewages. Of these the great majority are probably harmless. Pathogenic organisms, however, may be present in sewage, and the object of disinfection is to kill such organisms, or to so reduce their numbers that they may not be a menace to health.

For this purpose calcium hypochlorite, or bleaching powder, and liquid chlorine, have been used. The quantity required varies according to the quality of the sewage or effluent to be disinfected and the extent to which it is desired to reduce the number of bacteria. The quantity of available chlorine used varies from 3 to 6 parts per 1,000,000, which is equivalent to 25 to 50 lb. per 1,000,000 gallons of sewage. These quantities of chlorine are equivalent, roughly, to 75 to 150 lb. of bleaching powder per 1,000,000 gallons of sewage.

This treatment is not likely to produce a sterile effluent, but will reduce the number of bacteria growing at body temperature—37 deg. Cent.—from 75 to 90 per cent, and the coli from 90 to 95 per cent. Such disinfection has been assumed to be sufficient when the effluent was discharged into tide water above oyster beds, and an adequate protection of the public where the discharge was into large streams or bodies of water from which water supplies were taken, provided they were efficiently filtered and disinfected before use.

ACTIVATED SLUDGE TREATMENT.

During the past two years the attention of sanitary engineers has been focussed upon a new method of sewage treatment known as the activated sludge process. This process appears to have been discovered accidentally by Messrs. Ardern and Lockett, who presented the results of their original experiments at Manchester, England, in the *Journal of the Society of Chemical Industry* May 30, 1914. They found that when sewage was kept for several hours in intimate contact with sewage sludge, by agitation with a current of air, the sludge assumed the form of a light flocculent precipitate, the suspended and colloidal substances were attracted to and absorbed by these flocculi, and the dissolved matters were oxidised, the free ammonia being transformed into nitrates.

Milwaukee Experiments. Many experiments with this method of treatment have been made, the most notable perhaps being those of the Milwaukee Sewerage Commission, of which Mr. T. Chalkley Hatton is chief engineer, and Mr. William R. Copeland is chief chemist.

This process is still in an experimental stage, although at Milwaukee it was thought that sufficient progress had been made to warrant the construction of a 2,000,000-gallon plant, which was completed in December, and has been in operation two months. The plant consists of eight round aërating tanks 30 ft. in diameter, and of sufficient depth to accommodate about 10 ft. of sewage, including 20 per cent of sludge. Partitions are so arranged as to confine the sewage to channels 6 ft. wide, through which it flows continuously, passing from tank to tank. From the aëration tanks it flows to a sedimentation tank, being admitted at a considerable depth below the surface, and flowing upward to skimming troughs, into which it flows in a thin film at the surface of the tank. Two tanks of similar size are provided for the storage and re-aëration of the sludge collected in the sedimentation tank. The plant is also provided with the necessary air blowers and measuring devices. The equipment for handling, dewatering and drying the sludge has not yet been fully determined upon.

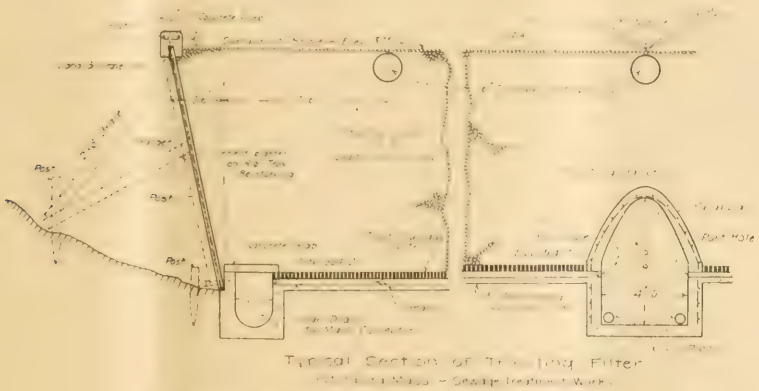

FIG. 4.—TYPICAL SECTION OF TRICKLING FILTER.

Method of Operation. While the methods of treatment in different places vary considerably, the consensus of opinion at the present time (1916) appears to be that operation by continuous flow through the aëration and sedimentation tanks is preferable to the fill-and-draw method which has been used in some of the smaller experiments. The process can be explained conveniently by describing the method of operation of the new Milwaukee plant, as it is intended to be used when certain modifications have been made.

Sewage Aëration.—Sewage flows continuously through the aërating tanks, which are provided at the bottom with an air distribution system, consisting of ducts above which are placed thin porous plates made by the General Filtration Company. These "Filtros" plates are confined to a single row extending along the middle of the sewage channel. The air is admitted to the porous plates under a pressure slightly greater than that exerted by the overlying column of sewage. In this manner the sewage is constantly mixed with the sludge by the rising air, and at the same time the sludge and the liquid are afforded an opportunity to absorb oxygen from the air. Just before the sewage is admitted to the first aëration tank it receives a dose of activated sludge, equivalent to 20 per cent of its volume. The method of preparing this sludge will be described later.

The period of aëration is intended to be about four hours, which obviously corresponds to the length of time required for the sewage to flow through the eight aëration tanks. The quantity of air required for aëration of the sewage appears to be about 1·75 cub. ft. of free air per gallon of sewage treated.

Sedimentation.—As it is important to maintain the sludge in intimate contact with all portions of the sewage in the aërating tanks, it is necessary to provide for sedimentation immediately after the sewage leaves them. The flocculent precipitate, however, settles quickly, and a clear effluent can be obtained from suitable sedimentation tanks. It is expected at

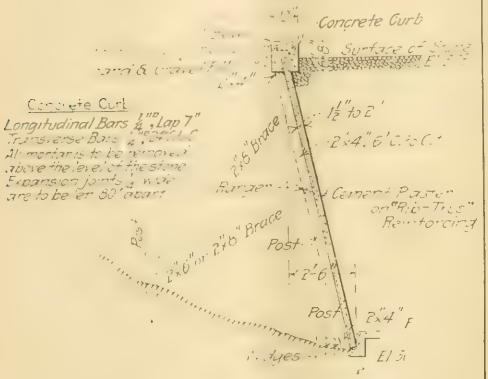

Fig. 5.—Details of Wall for Trickling Filters.

Milwaukee to reduce the quantity of suspended matter in the sewage to less than 20 parts per 1,000,000, as the effluent leaves the sedimentation tank. The suspended matter gradually falls to the bottom, where it accumulates as a thin sludge.

Sludge Handling.—From the sedimentation tank, in which the sludge naturally contains 98 or 99 per cent water, the sludge flows to a deep concentration well, where it is hoped to reduce the water content to 96 per cent or less. From this well the sludge may be pumped into the incoming sewage, or, when necessary, to the sludge reservoirs, where it is continuously aërated to reactivate it before pumping it to the raw sewage.

There are as yet very few data to indicate the quantity of sludge likely to be produced by the activated sludge treatment of sewages in general. The Milwaukee experiments indicate that the quantity will range from 3,000 to 6,000 gallons per 1,000,000 gallons of sewage treated. This sewage is relatively strong, its volume being equivalent recently to about 80 gallons per capita per day. It contains considerable industrial wastes, and may produce an abnormal quantity of sludge.

Analyses of this sludge indicate that when dry it contains sufficient fertilising ingredients to make its utilisation commercially attractive. There are, however, serious difficulties to be overcome in dewatering and drying the sludge. Very little progress has been made upon this phase of the problem.

Theory of Action.—The most noticeable effect of this treatment upon the sewage is the formation of the precipitate called "activated sludge." It is light brown in colour, apparently very light in weight, and readily forms loose aggregations, called "flocculi," resembling precipitated hydrate of iron. These flocculi are found to contain vast numbers of bacteria, which appear to be absolutely essential to the success of the process. It is conceivable that they exude certain substances which give to these flocculi their peculiar absorptive and attractive functions, and which enable them, while passing through the sewage, to gather to themselves the colloidal matter and bacteria, and to absorb certain of the dissolved substances.

The action of this sludge appears to be very similar to that of the bacterial jelly surrounding the stones of the trickling filter. The chemical changes which go on in the sewage, in both processes, appear to be practically identical. The efficiency, however, of the activated sludge flocculi, in holding the colloidal matter, appears to be greater than that of the bacterial jelly of the trickling filter, for the effluent from the aëration tanks, after proper sedimentation, is very clear and sparkling, while the effluent from ordinary trickling filters, even when in relatively good condition, is almost always turbid, even after the settling solids have been removed from it by sedimentation. The two processes, although very similar in theory of action, are carried on under different physical conditions. In the case of the trickling filter, the sewage is the moving medium, passing slowly over the absorbing jelly, by which its finely divided particles and some of the dissolved matter are absorbed, and subjected to bacterial decomposition and oxidation. In the aërating tanks, on the other hand, the bacterial jelly is the moving medium, which, in contact with the sewage, attracts and absorbs the finely divided and some of the dissolved substances, and within its confines subjects them to bacterial decomposition and oxidation.

Character of Resulting Effluent.—The well-settled effluent from the aërating tanks, as observed by the writer at Milwaukee, is clear, sparkling and colourless. It contains ordinarily less than 10 per cent

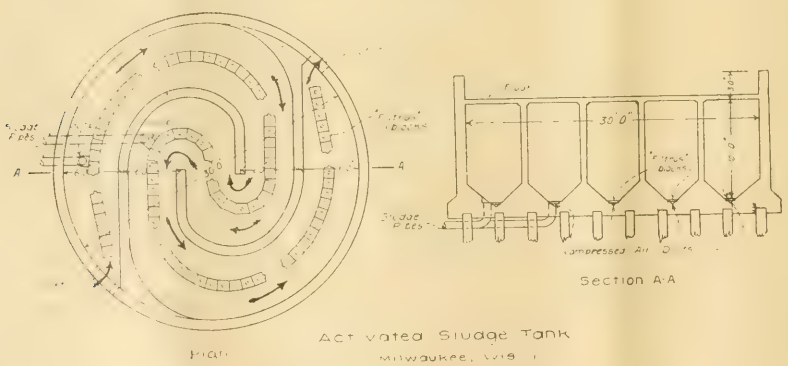

Fig. 6. Activated Sludge Tank.

as many bacteria as were present in the original sewage; it is relatively stable, keeping under exacting laboratory conditions for from three to five days, even in the winter when there is practically no nitrification, due apparently to low temperature of the sewage. In warmer weather there should be no difficulty in producing a stable effluent, and even a highly nitrified effluent.

Application to Trade Wastes.—This method appears to be adapted to the treatment of certain trade wastes. Experiments being made by the writer upon tannery wastes, give promising results, while those upon paper mill wastes are not encouraging, probably because these wastes are not as susceptible to vigorous bacterial action.

Cost.—It is too early to base estimate of cost of this process upon actual operating data. The expense will apparently be divided into two parts, that of the purification process and that of sludge disposal. Air alone, at the rate of 1½ cub. ft. of free air per gallon of sewage treated, will cost about $14 per 1,000,000 gallons of sewage, if power costs 2c. per k.w.-hour. Few small cities can hope to purchase power at a much lower cost, and other methods of treatment are likely to prove more economical unless a profit can be realised from the sludge.

Analyses of activated sludge from different experimental plants vary widely. Some indicate the possibility of a return from sale of commercially dry sludge, sufficient to warrant the payment of a substantial sum for dewatering and drying, but what these processes will cost is now problematical.

COMPARISON OF RESULTS OF METHODS OF SEWAGE TREATMENT.

Sedimentation, with or without screening, is capable of removing much of the suspended matter capable of settling in a short time. Referring again to the hypothetical sewage, by way of illustration, it may be assumed that this process will effect a removal of about 130 parts per 1,000,000 of suspended solids. This leaves 170 parts of suspended solids and 500 parts of dissolved solids, a highly putrescible effluent which is decidedly dirty in appearance. Such an effluent, however, may be turned into some streams and bodies of water without fear of causing serious deposits, and the quantities of diluting water may be such as to fully warrant such a course.

If, however, a better effluent be required, resort may be had to chemical precipitation, by which it is possible to remove colloidal and suspended matters more completely than by sedimentation, and to the extent of perhaps 290 parts per 1,000,000, leaving 510 parts of suspended colloidal and crystalloidal matter in the effluent of the hypothetical sewage. A large part of this consists of soluble matter. Even this reduction is not sufficient to render the effluent non-putrescible, and it might be added that in most cases where this method has been employed the operating costs have been so curtailed that the results obtained have hardly been comparable with those of which the process is capable.

The quantity of suspended and colloidal substances removed by screens, grit chambers, sedimentation and chemical precipitation may be tabulated as follows:

Coarse screens	5 to 10 parts per million
Fine screens	20 to 70 „ „ „
Grit chambers...	10 to 40 „ „ „
Plain sedimentation ...	130 „ „ „
Chemical precipitation ...	290 „ „ „
Activated sludge, more than	290 „ „ „

All of these methods, therefore, leave in the sewage some suspended and colloidal matter, and practically all of the crystalloidal substances. Where further purification is required, methods of oxidation are employed.

The results obtained by bacterial oxidation in sand or stone beds have varied greatly. The best results can be obtained undoubtedly by the use of sand filters with which a clear, sparkling, non-putrescible effluent can be produced without difficulty. Such an effluent is as good as can be obtained by any of the available processes and may contain no more bacteria than a well-disinfected settled sewage.

The activated sludge method produces a clear, sparkling, well-oxidised effluent. Its bacterial efficiency apparently approaches that of the sand filter, as does its power of oxidation and removal of organic matter.

To any one of these methods it is practicable to add disinfection with chlorine, which will reduce the number of organisms to such an extent that the discharge of the effluent into tidal waters, or into large bodies of water from which water supplies are taken and properly filtered and disinfected, should not endanger health.

By available methods it is practicable to produce an effluent of almost any required degree of purification. Local conditions in one place may favour the adoption of one method, while those of some other city may warrant an entirely different process. In general, where large bodies of water are available for dilution, it is unnecessary to adopt artificial means of oxidising the organic matter. While natural resources for the oxidation of sewage should be utilised as fully as is compatible with the general welfare, they should not be abused by the discharge of overtaxing loads of organic matter into streams and waters, by which their value of natural resources is destroyed wholly or in part.

The problem before the engineer to-day is not so much how it is possible to purify sewage as it is to determine to what extent the sewage should be purified to meet the existing conditions and by what process this can be most economically accomplished.

PERSONAL.

Mr. A. Wilson, surveyor to the Ashburton Urban District Council, has had his salary increased by £20 a year.

Mr. Lonergan, assistant county surveyor of South Tipperary, has had his salary increased from £100 to £110 a year.

Mr. Henry S. Ellis, borough electrical engineer of South Shields, has had his salary increased by £50 a year, bringing the total up to £500 per annum.

Mr. Harman, assistant to Mr. M. Hainsworth, surveyor to the Teddington Urban District Council, having joined the Army, Mr. Hainsworth was on Monday authorised to advertise for a general assistant.

Mr. Robert Pierce, M.INST.C.E., municipal engineer of Singapore, is resigning his position, and, in placing on record recently their deep sense of gratitude to him for the services he has rendered, the municipal commissioners resolved to ask his acceptance of a sum of £500.

Major W. T. B. McCormack, of the Australian Expeditionary Forces, who has arrived in this country in command of a company of Engineers, is a well-known civil engineer, and has made a special study of road engineering. He is desirous of getting information on this subject here, and we shall be pleased to forward to him anything helpful that may reach us as to methods, materials, or modern appliances.

Amongst those of the Wimbledon Borough Surveyor's department who have served at the front is Mr. F. Woolhouse, who was formerly in the Marines. He enlisted in September, 1914, and, though suffering from an injured foot, managed to "dodge" the doctor. He was engaged in sniping at Givenchy, La Bassée, where, after accounting for six Germans and

Sergeant-Major Woolhouse.

shooting one whom he left the trench to deal with he was shot by a man concealed behind a haystack, the bullet penetrating his skull, as shown in the accompanying photograph. He was again wounded in three places in the right arm at Aubers Ridge, Fromelles. He has just been appointed Sergeant-Major to the Officers' Training Corps, now quartered in an Eastern town.

OBITUARY.

Mr. John Briggs, burgh surveyor and sanitary inspector of Dumbarton, died, we regret to state, on Saturday last. He carried out many important municipal works during his tenure of office. An enthusiastic volunteer, he was at one time sergeant-major of the Border Brigade Bearer Company. Subsequently he was ambulance sergeant of the Dumbartonshire Volunteer Regiment, and he turned his ambulance knowledge to good account as a commandant of the Dumbarton V.A.D. As a shot he was regarded in his day as one of the Bisley experts.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars have reached us during the present week. Other reports will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Banbridge U.D.C.—It has been agreed to effect alterations in a large shed in the market yard, in order to make it suitable for a public slaughterhouse.

Bishop's Castle T.C.—Tenders are to be obtained for alterations to the sheds in the fair ground for the purpose of housing the fire engine.

Hemsworth R.D.C.—The council have approved the plans for a mortuary at Moorthorpe.

Norfolk C.C.—The Eastern Highways Committee have referred to the Bridges Committee a letter from the Aylsham Rural District Council, asking what contribution the county council were prepared to make towards the cost of putting Burgh Bridge into a condition of safety. It appeared that the district council were not liable for the repair of the bridge; it was the property of the Navigation Commissioners, who had no funds in hand. On the one side it was approached by a county council road and on the other by a district council road.

Winchester T.C.—The surveyor, Mr. W. V. Anderson, has received instructions to prepare plans for a public convenience at a cost not exceeding £200.

HOUSING AND TOWN PLANNING.

Petworth R.D.C.—With reference to a circular letter from the Local Government Board asking if there were any building contemplated in the council's area after the war, it was decided to reply that the council contemplated building cottages at Fittleworth, this scheme having been postponed until after the war.

Westhoughton U.D.C.—The Local Government Board have sanctioned an instalment (£3,160) of the sum required for the erection of forty-one working-class houses, and it is proposed to commence work at an early date.

MOTOR TRANSPORT.

Barnoldswick U.D.C.—It is proposed to purchase a Frances motor wagon for the health department, at an estimated cost of £335.

Bristol T.C.—The city council on Tuesday last adopted a recommendation of the Watch Committee to purchase a new motor fire engine for Bedminster, at a cost of £995.

Runcorn R.D.C.—It has been decided to purchase a motor ambulance, at an estimated cost of £535.

PARKS AND OPEN SPACES.

St. Andrews T.C.—It has been agreed to form a new nine-hole putting course on the golf links, at a cost not exceeding £200, the repayment to be spread over a period of ten years.

REFUSE COLLECTION AND DISPOSAL.

Grimsby T.C. It was reported that there was a large accumulation of old tins at the works which could not be disposed of. Before the war a German firm bought all the council could supply.—On the ground that the practice was a menace to health, the Sanitary Committee recently forbade scavengers to sort rags and other material from the household refuse they collected. As a result of this prohibition the men have demanded an increase of pay of 3s. weekly. They assert that the rags, which they regarded as their perquisite, brought them in 4s. weekly per man. At a meeting of the Sanitary Committee the mayor asserted that, despite the committee's orders, the men were still sorting the refuse, and the committee decided to let the application for an increase lie on the table.

Nottingham T.C.—The town council on Tuesday agreed to the purchase of 11 2-5ths acres of land adjoining the Radford gasworks, for the purpose of depot accommodation and the storage of refuse. The price was 2s. 6d. per yard. The Finance Committee were authorised to raise the purchase money, amounting to £4,201, by loan or otherwise. The mayor (Councillor J. G. Small), in moving the adoption of the scheme, said the interest on the money—about £6,200—at 6 per cent, was approximately £370 per year. Mr. Terry, the manager of the nightsoil department, had stated that for £12 10s. per week they could cart the clinker refuse from the destructor, and with this land, at the site available, it could be done for 30s. per week, thus representing a saving of £570 per year.

ROADS AND MATERIALS.

Consett U.D.C.—In addition to certain other proposals it has been decided to include the widening of Victoria-street in the list of works to be carried out after the war.

Doncaster T.C.—It is proposed to proceed with the reconstruction of a portion of the tramway track at Bentley.

Elgin C.C.—A report by a sub-committee of the County Road Board was submitted as to the damage done to the Kellas road by the recent flooding. Various schemes were considered, but the committee recommended that the line of the new road should be adhered to. A further report expressed satisfaction with the progress of the work.

Fifeshire C.C.—The road surveyor, Mr. T. Aitken, estimates that the cost of repairing the roads caused by flooding will be £800.

Frome U.D.C.—It was reported that the county surveyor had consented to the use of limestone on certain roads in the town, being satisfied that there was no stone of the better qualities available.

Helston R.D.C.—The council decided on Saturday to adopt the system of payment of workmen's wages by cheque, on the suggestion of the district auditor, and granted the highway surveyors and sanitary inspector for the north and south districts an increase of salary of 5s. per week for the duration of the war, or until the resumption of normal prices.

Hetton (Durham) U.D.C.—Instructions have been given to the surveyor, Mr. J. Harding, to prepare another scheme for the proposed improvement of Three Tuns-road.

Leake R.D.C.—A committee appointed by the council to consider means to obviate flooding on the Gotham-lane do not recommend any steps for a road scheme which would cost about £100. There is an alternative scheme across the fields, which would cost not much above £10. The matter is now being considered by the parish council.

Newport (Mon.) T.C.—The Parliamentary Committee have passed a resolution in favour of proceeding with the proposed improvement at Cardiff-road and Courtybella crossing as soon as circumstances will permit. The estimated cost of the scheme, exclusive of land, is £25,000. The railway companies have been asked to make a contribution towards the cost.

Nottingham T.C.—The town council on Tuesday authorised the Improvement Committee to take steps to improve the dangerous corner leading from Derby-road to Beeston-road, and the further corner leading from Beeston-lane to Beeston, in such a manner as to make it possible for drivers of wheeled vehicles to see approaching traffic.

Oswestry T.C.—It has been agreed to proceed with the widening and fencing of the bend nearest to the last houses in Whittington-road, at an estimated cost of £73, and that the widening at the further bend in the road be deferred with a view to a grant being obtained from the county council and the Road Board.

Oswestry R.D.C.—The surveyor, Mr. T. H. Davies, reported that he had had an interview with Mr. Brookes, an engineering official of the Road Board, who seemed very favourable towards making a grant towards the repair and improvement of Twmpath-road, and suggested that the contribution should be one-third of the total cost. He (the surveyor) estimated the total outlay at £484, of which £234 was for the work of resurfacing the road. The council decided to ask for two-thirds of the cost.

Oulton Broad U.D.C.—A letter was submitted to the Roads Committee from the East Suffolk County Council with reference to discontinuance of watering

of streets on grounds of economy and difficulty in obtaining labour, the opinion of the county medical officer being that this was a very shortsighted policy, particularly at this season, when the ground temperature was gradually increasing. The association of rises in ground temperature and increases in number of cases of diarrhœa and vomiting in infants was well known, and in view of the fact that it was desired to conserve the infant population he thought councils should be urged to water streets at any rate for the next two months in order to prevent as much as possible the dust and germs being blown about.

Portrush U.D.C.—It has been agreed to steam-roll the roads in the extended area, and to obtain tenders for stones and screenings and also for steam-rolling.

Portslade U.D.C.—In reply to the circular letter from the Local Government Board, as to the proposed execution of works after the war, it was decided to name the widening of Southern Cross cross-roads, and making up of Wellington-road, and also certain private works.

Rugeley U.D.C.—It is proposed to spend a sum of £240 on repairs to the Sheep Fair and Hagley-road.

Teignmouth U.D.C.—Explaining an increase of the half-year's estimate for road maintenance from £395 to £580, the surveyor, Mr. F. W. Knight, stated that he had estimated only for the work that was absolutely necessary. Some of the roads were not re-metalled every year, but this winter it was necessary. These roads could not possibly go another winter.

Tyrone C.C.—The county surveyor, Mr. F. J. Lynam, reported that his estimate for repairing the roads and bridges destroyed by the August storm had been increased from £1,671 to £3,071, but that the temporary work which he was carrying out might last for ten years. He had got some fairly substantial temporary timber bridges finished, and he suggested the adjournment of the question of permanent reconstruction for some time and to limit the immediate expenditure in these cases to £1,000. The council agreed to these proposals.

SEWERAGE AND SEWAGE DISPOSAL.

Auckland R.D.C.—A tender at £152 has been accepted for sewerage works.

Bodmin T.C.—Complaint was made at the council meeting on Tuesday of the condition of the sewage disposal works, and it was decided that the whole council in committee should view the works and see what is required to be done.

Downham U.D.C.—It is proposed to take up a loan of £1,939 for the purposes of the sewage disposal scheme.

Hertford R.D.C.—The Local Government Board have declined to sanction a loan for the construction of sewage disposal works at Tewin.

Holsworthy U.D.C.—The medical officer, Dr. Gray, on Tuesday last again reminded the council that no analysis of the water has been made for five years, and that the sewage system of the town is antiquated, highly insanitary, and quite incapable of being improved. Only a new system and modern sewage disposal works will, he states, remedy the existing defects.

Midlothian C.C.—The Suburban District Committee, having considered in considerable detail the question of surface-water drainage at Corstorphine, decided to ask the Water of Leith Purification and Sewerage Commissioners to appoint representatives to meet representatives of the District Committee to discuss the whole question.

Morley T.C.—It has been agreed to enlarge the press-house at the sewage disposal works by the addition of two presses, at an estimated cost of £970.

Rochdale T.C.—A vacuum gully emptier is to be purchased for the use of the street cleansing department.

WATER, GAS, AND ELECTRICITY.

Conway R.D.C.—Complaint having been made as to the serious condition of the public wells, the sanitary inspector has been instructed to submit a report on the subject.

Dewsbury T.C.—A decision has been reached to provide an additional water supply at Thornhill.

Exeter T.C.—A recommendation of the Cleansing and Lighting Committee to give permission to Exeter Gas Company to substitute a standard of calorific power for a standard of illuminating power has been referred back for further consideration.

Exmouth U.D.C.—The Special Lighting Committee reported that they had met the directors of the gas company, who had accepted an offer of payment in settlement of all claims arising under their contract at the rate of £350 per annum from the date of the order for the extinction of all street lights until the date that the order be revoked, the contract remaining in force as if no order had been made. The committee regarded such a settlement as satisfactory from all points of view, and the council approved the report.

Holmfirth U.D.C.—The council have approved the extension of the electricity mains to Bottoms and Burnlee.

Hythe T.C.—In declining to sanction a proposed loan of £860 for new water mains at Tawner's Hill, the Local Government Board advise the town council to consider whether the money can be paid out of the rates.

Llanelly R.D.C.—The council are asking the Public Works Loan Board for a loan of £34,883 in connection with the water supply undertaking now being carried on under the provisions of the Llanelly Rural District Council Act, 1912. This Act authorised the council to borrow £179,483 and any further moneys the Local Government Board might sanction. Owing to the war a good many of the works were closed down, but a large quantity of water is required at Pembrey; hence the application.

Newport (Mon.) T.C.—The Electricity Committee and Waterworks Committee recommend that a war bonus of 3s. per week be paid to their employees, skilled or otherwise, if over twenty-one years of age.

Oswestry T.C.—The borough surveyor and engineer has called the attention of the town council to the serious position of the town in the matter of the water supply. In reference to this the mayor (Mr. R. S. Parry) stated that there was only about a week's supply in the reservoirs. They were getting 250,000 gallons a day from the Liverpool supply, this being the amount they were allowed to receive by Act of Parliament. The consumption the week before last was at the rate of 392,000 gallons per day. There was a lot of water being wasted at the present time. It had been suggested that they should turn the supply off at night time, but his opinion was that more water was lost when that was done than if it was not cut off at all. It was agreed that a meeting of the Water Committee should be convened to discuss the situation.

Oswestry R.D.C.—A committee has been appointed to visit Middle Hengoed to ascertain if temporary steps can be taken to deal with the water supply.

Paul U.D.C.—In connection with the report by Messrs. Douglas, Lewis & Douglas, with respect to the water supply, it is proposed to sink a well and take an analysis of the water.

Plymouth T.C.—The three water undertakings of Plymouth, Devonport, and Stonehouse showed on last year's working a nett profit of £5,690.

Plympton R.D.C.—The Water Committee have been authorised to carry out the necessary works in connection with the leakage at the reservoir, at an estimated cost of £150.

South Shields T.C.—The total revenue of the electricity undertaking last year was £90,757, a decrease of £3,745 compared with the previous year. With reference to the capital expenditure a member stated that it totalled £225,000, and the contributions to the sinking fund amounted to £105,000, so that altogether the concern was in a very comfortable condition.

Swansea T.C.—The Electricity Committee reported that negotiations had been opened with the Harbour Trust with a view to all the electrical energy required at the docks being supplied by the corporation in the same way as it is now supplied to the tramways undertaking. It was decided to extend the central works at a cost of from £20,000 to £25,000.

Wolverhampton T.C.—The nett profit of the electricity undertaking last year was £1,586, which has been transferred to the reserve fund.

MISCELLANEOUS.

Carnarvon T.C.—With regard to street lighting under the new order the Lighting Committee reported having met the chief constable, who had promised to give his consideration to suggestions for keeping

certain lamps alight from two hours after sunset till midnight, in addition to four corner lamps which he had already approved. There was also a proposal by the committee to have lamp-posts painted white. A discussion arose as to the relative merits of painted lamp-posts and whitewashed kerbstones as a means of guiding pedestrians at night, and eventually the question was referred to the Lighting Committee for decision.

Dorchester R.D.C.—It has been agreed to apply for exemption from military service for Mr. J. J. Estridge, the highway surveyor.

Gateshead T.C.—The town council have approved a report of the Town Improvement Committee stating that they did not see their way clear to recommend the council to approve the promotion of the suggested Bill for the linking up of the tramways systems of Newcastle and Gateshead by means of tramways across the high-level bridge until such Bill has been considered by the council, and all proper provisions which the council may think necessary to safeguard the interests of Gateshead have been inserted therein.

Hartlepool T.C.—In reply to the Local Government Board inquiries regarding public works to be started after the war, the town council have decided to state that they propose to proceed with their housing scheme, and other probable works are the proposed extension northwards of the promenade, the protection of the cliff to the south of the promenade, and the provision of a new school at Throston; while reference may also be made to a project for a tunnel under the channel between Hartlepool and Middleton, or for a bridge over it.

Salford T.C.—The nett profit of the tramways undertaking last year was £18,473, and in order to permit of the promised payment of £22,000 in relief of the rates, £3,526 has been transferred to the current account from the depreciation and renewals fund. The balance remaining in the depreciation fund is £21,266. During the year £13,135 was disbursed in allowances to the families of men who are in the Army.

Teddington U.D.C.—The surveyor, Mr. M. Hainsworth, has purchased a 3-h.p. gas engine for the workshop at the sewage works for the sum of £12.

FOR OTHER ADVERTISEMENTS

See End of Paper.

BARTON-ON-HUMBER URBAN DISTRICT COUNCIL.

SURVEYOR AND INSPECTOR OF NUISANCES.

The above Council are prepared to receive applications for the post of Temporary Surveyor and Inspector of Nuisances. Population about 6,000.

The person appointed must be fully qualified, and be ineligible for the Army.

The appointment will be made for the duration of the war only, or until the return of the Council's permanent Surveyor, and will be subject to the sanction of the Local Government Board.

Applications, in own handwriting, stating fully age, qualifications, salary required, and when can commence duties, with copies of not more than three recent testimonials, to be sent to the undersigned so as to reach him not later than the 30th September, 1916.

Canvassing will be a disqualification.

G. H. NOWELL,
Clerk to the Council.

Barton-on-Humber,
Lincolnshire.
September 12, 1916. (3,093)

BOROUGH OF BEDFORD.

TEMPORARY ENGINEERING ASSISTANT.

Wanted, in the Borough Engineer and Surveyor's Office, a Temporary Engineering Assistant (ineligible for military service) for the duration of the war.

Applications, in candidate's own handwriting, stating age and salary required, and giving full particulars as to experience, and accompanied by copies of not more than three recent testimonials, to be sent to the undersigned not later than Saturday, September 30th.

Canvassing will disqualify.

N. GREENSHIELDS, ASSOC.M.INST.C.E.,
Borough Engineer and Surveyor.

Borough Engineer and Surveyor's Office,
Town Hall, Bedford.
September 12, 1916. (3,097)

BOROUGH OF BEDFORD.

WATER INSPECTOR.

Wanted, in the Waterworks Engineer's Department, an Assistant Water Inspector (ineligible for military service).

Candidates must be qualified plumbers, capable of laying and repairing water mains, services, fittings, &c., and experienced in the management of men.

Wages 40s. per week, in addition to which a temporary war bonus of 5s. 6d. per week will be paid during the period of the war.

Applications, in candidate's own handwriting, stating age and giving full particulars of experience, and accompanied by copies of not more than three recent testimonials, to be sent to the undersigned not later than Saturday, September 30th.

Canvassing will disqualify.

N. GREENSHIELDS, ASSOC.M.INST.C.E.,
Waterworks Engineer.

Waterworks Engineer's Office,
Town Hall, Bedford.
September 12, 1916. (3,096)

RURAL DISTRICT COUNCIL OF FAREHAM.

LEE-ON-THE-SOLENT MAIN SEWERAGE.

CLERK OF WORKS REQUIRED.

The above-named Council invite application for the appointment of a Clerk of the Works in connection with the completion of the Lee-on-the-Solent Main Sewerage, which consists of about 2½ miles of sewers.

The duties will include the Superintendence of all House Connections to the sewers, and supply all necessary information to the Council in connection therewith.

Considerable experience in the supervision of Sewerage Works is essential, and the Candidate must be able to Test Materials, Set out Work, use the various Surveyor's Instruments, and Measure all work done.

The person appointed will be required to work under the direction of the Engineer, Mr. Wilberforce Cobbett, ASSOC.M.INST.C.E., and to devote the whole of his time to the work during the Contractor's working hours. The work is expected to last nine months, and the appointment will be subject to one month's notice on either side.

The salary will be 3½ guineas per week.

Applications, endorsed "Clerk of the Works," stating age and qualifications, accompanied by copies of three recent testimonials, to be sent to the undersigned not later than 10 o'clock a.m. on Friday, the 22nd inst. The successful applicant will be required to reside at Lee-on-the-Solent.

Applicants who canvass any Member of the Council, either directly or indirectly, will be disqualified.

(By order)
ALFRED LAKER,
Clerk to the Council.

97 West-street, Fareham, Hants.
September 12, 1916. (3,095)

COUNTY BOROUGH OF SOUTHEND-ON-SEA.

The Corporation of Southend-on-Sea invite Tenders for the Supply of Coal for a period of one year from 1st October, 1916.

Form of Tender may be obtained on application to Mr. Ernest J. Elford, Borough Engineer and Surveyor, Municipal Buildings, Southend-on-Sea.

Sealed Tenders, endorsed "Tender for Coal," to be delivered at my Offices not later than 9 a.m. on Thursday, 21st September, 1916.

No Tender will be considered unless made on the prescribed Form.

The Corporation will not be bound to accept the lowest or any Tender.

(By order)
H. J. WORWOOD,
Town Clerk.

Town Clerk's Office,
Southend-on-Sea. (3,098)

FULLY QUALIFIED SURVEYOR seeks Appointment. Would undertake Temporary Work.—Apply Box 1,585, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (3,094)

THE DISPOSAL OF EXCRETA IN THE TROPICS.*

By ANGUS MACDONALD, M.D., D.P.H., D.T.M.,
Medical Officer in Charge of the International Health Commission, Grenada.

The advent of the International Health Commission with its initial crusade against hookworm infection has emphasised the sanitary necessities of the tropics. For ankylostomiasis is a disease of tropical conditions, and attack upon it is a matter of tropical sanitation. Being a disease of soil infection, it is essentially a disease of the country, and it is to the country parts especially that attention has to be directed. . . .

In the main, without entering on debatable problems which will be solved when sufficient data are brought forward, it must be conceded that the bare-footed individual, no matter of what race, age or sex, brought in contact with hookworm-polluted soil is in the fair way to hookworm infection. The prevention of soil pollution realised, therefore, the problem is restricted to the disposal of human excreta in manner suitable to attain that end without detriment to the preventive aims already secured for other purposes. There does not appear so far to have been any serious consideration given to this aspect of the disposal of excreta, though practical sanitarians, wherever hookworm treatment on a large scale has been undertaken, have been forced to adopt such measures to prevent soil pollution as seemed locally suitable. . . .

Abundant detail . . . is given of different forms of closet or latrine, but scant consideration is given to the actual disposal of the excreta. The main preventive purposes in view in any system of disposal have been the removal of a nuisance and the prevention of personal, fly, and water infection of cholera, dysentery, enteric. Even then, theoretical sanitarians have been content to give their assent in favour of this, that and the other perfect type of closet, not considering cost and satisfactoriness of ultimate disposal.

Legislation also within my knowledge in different colonies has ordained with elaborate detail a special type of closet and left altogether out of account that the daily emptying which was obvious had to be arranged for in some safe manner.

CUSTOMARY METHODS OF DISPOSAL.

It may be useful to review briefly the customary methods of disposal throughout the tropics. I sum them up under four heads . . .

(1) Water carriage. (2) Human carriage. (3) Original permanent disposal. (4) Natural disposal.

(1) Water carriage usually implies direct transport of excreta from closet to deposit in sea, on farm or on treatment beds. But the sewers may be used for subsidiary conveyance of the contents of buckets pails, utensils, deposited at intakes from institutions or at other authorised situations. This minimises the preventive advantages of a sewerage system by retaining an amount of personal handling of utensils. . . .

(2) Human carriage is to be used to include that large variety of latrine service, the principle of which is local deposit in pan, bucket, tub (commonly), on ground surface (frequent, in which case, crabs, beetles, ants, rat, dog and vulture may perform the disposal); in vault or pit under or near dwellings (Bombay, Barbados, Panama); in large concrete vaults (China, Accra); in pits (Jamaica and South American cities), followed by daily or at least frequent removal. It is obvious that no matter how speedily local nuisance and danger may be removed, without special disposal arrangements soil pollution will take place. For, in spite of its poor manurial value, human excrement all over the world is regularly destined for soil enrichment.

(3) Original permanent disposal is typified in the pit of the desert, the Arab well, and is seen in the deep pit which is not emptied for years at a stretch (Kingston, Jamaica, and several South American cities), and in the septic tank which may be found in some countries directly under the dwelling and in others somewhat removed. In these types soil pollution is practically obviated.

(4) Natural deposit may be asserted of the method adopted amongst rural populations all over the world. Undoubtedly, this leads to the most intense soil and water infection.

From this brief and undetailed survey of methods it may be acknowledged that the sewerage system with deposit in sea and the original permanent deposit (deep pit and septic tank systems) are the only methods that satisfy the postulate the prevention of soil pollution. It will no doubt at once be conceded that a sewerage system conserves as far as possible the other demands of preventive medicine.

I claim the same concession for the deep pit, and recognise the sewerage system (with deposit in sea or by other method of preventing soil pollution) as the ideal system for town, the deep pit system the ideal for the country. Later I shall detail my reasons for supporting the deep pit. To consider the methods that will secure the prevention of soil and water pollution, there would appear to be but two practicables: (1) Destruction of excrement, and (2) safe deposit of excrement.

(1) Destruction may be brought about by (*a*) heat and by (*b*) chemicals. (*a*) Incineration is satisfactory only where the container is destroyed in the general combustion or is cleansed in the process. In the former method combustible utensils of wood pulp and various compositions, or readily destructible vessels of clay or metal may be used; in the latter weighty buckets of metal that will withstand repeated and continued heating are required. These methods may both be adopted in institutions, but cost and labour prohibit their domestic availability. The dangers incident on the frequent handling of infected vessels are still present.

(*b*) Chemical destruction of fæces (on the domestic scale) may be possible superficially, but the integrity of the inner part of solid excrement will probably be preserved through any possible domestic chemical treatment. The known destructive and inhibitive action on hookworm ova and larvæ of common salt has so far as I am aware been put to no practical use, unless mere disposal in sea may be so regarded.

SALT AS A DEODORANT.

As a result of practical observation on the wholesale use of salt along with series of laboratory experiments, I am of opinion that a very valuable chemical destructive agent may be obtained by a mixture of equal parts of salt and sand added in usual amount (2 or 3 to 1) to fæcal deposit in bucket or pit. The deodorant effect is more satisfactory than that of dry earth, ashes or lime, and in the case of the bucket a saline film (in a moderately humid atmosphere) remains about the metal, which renders cleansing simple and prevents adherence of fæces and odour. Although laboratory experiment has given evidence of destructive permeation of the fæcal mass by the salt, this fact alone would not justify surface disposal of infected fæces which had only a twenty-four hours' exposure to the saline mixture, as would be the case ordinarily with the domestic bucket. Still, where buckets have to be used the salt mixture has valuable properties, and, as a matter of additional safety, might compensate for the inevitable occasional mis-disposal of the most carefully tended bucket systems. The use of salt also repels flies. Certainly where salt can be produced cheaply and abundantly it should be as readily attainable as dry earth, and is preferable. All things considered, I cannot be said that the domestic destruction of excrement is a feasibility for the general population.

(2) We have conceded that water carriage with deposit in sea ensures safe deposit from a broad hygienic outlook as well as from the limited demand for the prevention of soil pollution in respect of hookworm infection. For practical purposes also a well ordered sewerage system, where the sewage is utilised on a sewage farm or subjected to some specific treatment, may be regarded in the light of safe deposit. For it must not be overlooked that the amount of hookworm infection in an urban community is initially small, and in a sewered city the immigration of infected rustics would be fraught with little danger to the other town dwellers. . . .

THE DEEP PIT CLOSET.

The question to be faced is the provision of the means of safe deposit of human excrement for the ninety and nine of the rural population. As affirmed above, I believe the deep pit closet is the only system of latrine service that in general is likely to supply the demand. I contend for its advantages in general and readily concede its drawbacks in particular. But, accepting the idea communities by hook latrine, and

* From the *Journal of State Medicine* for September.

artifice may succeed in accommodating it to local conditions of any variety. The only alternative for the populations under consideration is some type of bucket closet. This inevitably means human handling and as inevitably means a pit for safe deposit. Shallow pit or trench deposit is useless to prevent soil pollution. . . .

Above all things the avoidance of human interference should be recognised as a first principle in all such matters of domestic sanitation. The ideal soil on which to construct the deep pit closet is sand, shingle or gravel. In these situations within the tropics such closets are the natural systems adopted, and they have proved their advantages and dangers throughout centuries. No doubt cholera may have been propagated by them in the Arabian desert, and enteric may have come from them in Jamaica before the days of pipe-borne water. The very deep pit of the desert does not harbour flies, nor does the deep pit of Jamaica. Musca is not allured 6 to 12 or many more feet down a pit containing gases evolved from fæcal decomposition, though there may be some attraction when the deposit approaches the top. Nuisance then becomes apparent and the householder is anxious to have the condition changed. The pit is then filled up and a new one constructed, or it is emptied and the matter buried elsewhere.

The deep pit dug in gravel or sand may be from 8 to 12 or many more feet in depth, with a section of 6 by 4 ft. rectangular, or a corresponding diameter if circular. Its sides may be lined with brick or stone dry set, and the bottom may be left unlined to allow of ready drainage. A storm-water wall, rising some 9 to 12 in. above ground level, will support the wooden erection above the pit. Where the pit is designed to be emptied periodically, the house and flooring are joined together and tilted over on the ground behind during the emptying process. The same building also can be lifted and placed over a new pit.

From data collected over four and a half years recently in Kingston, Jamaica, the life of a reasonably cared-for pit closet, some 8 to 10 ft. deep, and 6 ft. by 4 ft. in section, and contributed to by a fair population, was eleven years. Nuisance is slight if drainage is good and entrance of storm-water is prevented. The condition is otherwise if these essentials are neglected. The freedom from nuisance, the very slow rate at which it fills, and the rapidity of poudrette formation are striking features of the really deep-dug pit in the tropics.

It must be borne in mind, and I wish to emphasise it, that there is absolutely no comparison between the deep pit closet and the common privies and privy middens of England. . . .

To summarise briefly the points considered:—

(1) The disposal of excreta in the tropics should, in addition to the other essentials, secure the prevention of soil and water pollution.

(2) Means of safe deposit may be attained by deposit in sea, incineration, and burial.

(3) Deposit in sea may be by means of water carriage or (less satisfactorily) by human carriage.

(4) Incineration is of value, but is not a practicable means for the general population.

(5) Burial may be secured in the cesspit or septic tank, the deep pit closet, or in a pit into which the domestic pail or other utensil is daily emptied.

(6) The safe handling of utensils and safe deposit from them is impossible to enforce by any authority, and is barely practicable for the individual.

(7) For the general population, the deep pit closet, lasting ten or twelve years, or a pit closet of smaller dimensions filled and dug anew at frequent intervals, offers the safest solution of the problem.

(8) The disadvantages of the pit closet are: (*a*) Nuisance from odour if excreta are not systematically covered over, or if storm-water gains access. (*b*) Danger from fly infection—a rare possibility in the deep pit—less improbable in the shallow. (*c*) Mosquito breeding—a rare possibility. (*d*) Possibility of pollution of sources of water supply.

Suitable education of the people and an efficient sanitary system should overcome these disadvantages.

Professor Turner and Summer Time.—Professor H. H. Turner, F.R.S. (Oxford University), in a paper on "The Measurement of Time," read at the recent meeting of the British Association, said that the new system of summer time, though it had met with some opposition from astronomers, had proved of great advantage to the public, and he hoped it would be made permanent—not merely for the duration of the war, but for the indefinite future.

EXPERIENCE WITH WOODEN WATER-PIPES.*

By Arthur W. Dudley,
Manchester, New Hampshire.

Wooden water pipes, when encountered in street excavations, are invariably found to be entirely free from decay. These ancient pipes were bored logs, and in their manufacture the very best part of the timber —namely, the heart—was removed. It may be asked why, if wood pipe was so durable, should cast-iron or any other material be substituted? The answer to that question is that the old method of making a wood pipe limited its inside diameter to the size of the log, and therefore large pipes were both expensive and usually impracticable; 6 in. inside diameter was nearly the limit of such pipe. By the modern method of making wood pipe the diameter is practically unlimited, and it has been made in the continuous form up to 10 ft. in diameter.

The two forms of wood pipe in common use are the continuous pipe, built of staves, breaking joints, put together in the trench, and what is termed "machine made." This latter is made in lengths of from 3 ft. to 14 ft., and shipped to the work ready to be laid. The staves are about 2 in. in thickness, and cut true to the circle of the diameter of the pipe. These staves have two beads upon each longitudinal edge, and two corresponding grooves in the other longitudinal edge. The beads are slightly larger than the grooves, and when pressed together the bead crushes into the groove, this making it perfectly watertight. At one end there is a tenon 4 in. long where the staves are one-half the thickness of the balance of the walls of the pipe. On the other is a chamber cut 4 in. deep. The tenon is slightly smaller in diameter at the end than at the shoulder, so that when driven into the chamber it makes a watertight joint. These staves, cut radially to correspond with the diameter of the pipe, are held together by a steel band, either flat or round, wound spirally upon the pipe by a machine. The high tension of this band forces the beads into the grooves, making a longitudinal joint that cannot leak so long as the elastic limit of the bands is not overcome. After the pipe is wound, and the tenon and chamber cut, it is rolled in a bath of asphalt that adheres to the outside of the steel and wood, protecting them from oxidation. Usually a second coating of asphalt is applied. It is then rolled in a bed of sawdust that forms a protection for it in shipping and handling. It is laid by driving one piece into another until the shoulders are in close contact. This form of pipe is made for diameters from 3 to 36 in.; the larger pipes are made in the continuous form.

The eastern [United States] manufacturers make their pipes of the best obtainable Canadian pine. The Pacific Coast pipe is made of Douglass fir and redwood, and is banded with round steel wire, instead of flat steel, and differs also in that the pipes are all made with tenon ends, that are connected with sleeves, 6 to 8 in. in length. The manufacturers claim that this method of connecting gives greater strength to the pipe line, and also that Douglass fir and redwood is a stronger material than pine. The writer, however, after experimenting with both forms of pipe, came to the conclusion that, while the claim that the sleeve method of connection may be stronger, the difficulty in coating the exposed ends of these sleeves, and the fact that they would not be saturated at all times, exposed them to greater danger from decay. Also that, while Douglass fir might, and probably does, possess greater tensile and crushing strength than pine, its greater brittleness exposes it to more danger from water hammer, and for these and other minor reasons has given the preference to the tenon and chamber, flat-hooped pipe. This form of wood pipe was first laid in New Hampshire in 1895, at Penacook, a suburb of Concord, and this system was afterwards connected with and incorporated into the Concord water system. The Antrim water system, constructed in 1896, is a gravity system; its source of supply is some three miles from the village, and the head is slightly over 200 ft. The entire system, both supply and distribution pipes, is of wood. The writer on several occasions during the past few years has uncovered and examined pipes in this water system, and has invariably found them as perfect as when laid; the leakage here, as in all wood pipe lines that he has had to with, is infinitesimal.

Other water systems, most of them designed and

* From a paper read before the New England Waterworks Association.

constructed by the writer, are: (1) Campton Village, where the head is 186 ft. and the supply pipe 12 in. and 10 in.; the distribution pipe, 8 in. and 6 in. in diameter; this was constructed in 1905. (2) Freedom, New Hampshire, constructed in 1912, with a head of 300 ft. Both of these systems have no apparent leaks and have cost next to nothing for repairs since their installation. Bristol, New Hampshire, has a 20-in. wood pipe supply line connecting the village distribution system with the source of supply. Laconia, New Hampshire, has a wood pipe intake line laid 400 ft. into Lake Winnepesaukee, connecting with the pumping station. Hudson, New Hampshire, has an 8-in. supply line, and the writer's firm is this season constructing two water systems with wood pipe supply line, one with a 4-mile distribution line, in a suburban street. The smaller system is at Troy, New Hampshire. The source of supply is a small stream that has its source in the west slope of Mount Monadnock, and this wood supply line, some four miles in length, is of 12-in. and 10-in. pipe, the head is 310 ft., the distribution system is to be cast-iron pipe. This is now in progress of construction, and is about three-fourths completed. The wood pipe used is of the Michigan pattern

SOME ADVANTAGES.

To sum up the situation, wood pipe has, besides the saving in cost of both pipe and installation, these advantages:—

(1) It is preserved by water, and not rusted or corroded by it.

(2) It is not corroded by any substance, or destroyed by acids or salts.

(3) Its carrying capacity is 20 per cent greater than cast-iron pipe, and remains constant, while that of metal pipe decreases with age.

(4) It does not taint or affect fluids going through it.

(5) It does not burst if frozen, the elasticity of the wood preventing it.

(6) It requires less labour and experience to lay in place than metal pipe, and a considerable saving can be made here.

(7) It can, when service pipes are not taken off, be laid in shallower ditches than metal pipe, for it is not so easily affected by frost.

(8) In the writer's experience, while more or less joints show slight leakage when the pipe is first filled, they soon swell up and give less trouble in the end than cast-iron pipe.

THE ACTIVATED SLUDGE PROCESS.

AN AMERICAN COMMITTEE.

At Pittsburg recently, members of the American Society of Civil Engineers met informally to discuss various problems in connection with the treatment of sewage by the activated sludge method. A report of the acting secretary, Mr. T. Chalkley Hatton, stated that the time had not yet come for effecting a permanent organisation to avoid duplication of experiments in the United States and Canada and preventing control of the activated sludge process by patents issued without complete information having been submitted to the commissioner of patents.

Believing that the best results could be obtained through a committee and personal service, Messrs. F. A. Dallyn, provincial sanitary engineer, Toronto; George T. Hammond, engineer of designs, Borough of Brooklyn, New York City, and T. Chalkley Hatton, chief engineer of the sewerage commission, Milwaukee, were appointed to prepare standard definitions and other terms relating to the activated sludge process of treating sewage. They will also tabulate and distribute a summary of work now being done or contemplated, and suggest such correlation of current work as may be desirable.

The question of submitting to the commissioner of patents information relating to priority of knowledge of the activated sludge process was left with Professor Earle B. Phelps, Messrs. H. W. Clark, and George T. Hammond, and Dr. Edward Bartow, with the understanding that all members present should assist by giving the commissioner all possible information in affidavit form.

CAMP SCAVENGING.

COUNCIL OR MILITARY CONTROL?

At the meeting recently of the Oswestry Rural District Council, the chairman, Mr. N. W. Wilthew, read a report of the Scavenging Committee in which it was stated that the debit balance on the work of scavenging the camp, including an initial loan of £250 from the council, had now been reduced to £161. The War Office had intimated their intention of taking over the whole of the scavenging work after the military vacated the canvas camps this autumn. The committee had decided, in view of the fact that a big initial expenditure had been recouped, to offer to continue the work in the meantime at a charge of 2s. per 100 men per day.

Mr. Peate, who is chairman of the Sanitary Committee, said that the council had previously charged 3s. per 100 men per day, but they now found they could do the work remuneratively at 2s. He did not want to criticise the War Office, because, in ordinary circumstances, they ought to do the work, but he did think that while the war lasted they would be well advised to retain the council's services for the work. The Scavenging Committee had gone carefully into figures and had found that the revised price they were now able to charge would result in a saving on the books of population in the camp of £2,700 a year. But that alone was not the most important thing. It was the intention of the War Office to bring 100 able-bodied soldiers to do the work which they, as a committee, were very well able to do with twenty or even less men over military age. He did think in a time like this, when there was a great scarcity of men of military age, and local tribunals were being urged to send more, it was a great mistake on the part of the War Office to do that work. While it was not within the province of the council to dictate to the War Office in any shape or form, he was sure they were acting unwisely, both from a monetary and military point of view. It was only right he should point out that the committee and the scavenging superintendent had been complimented by the people concerned on the way in which they had carried out their work. Answering a question by Mr. Lovett, Mr. Peate said that, as far as the committee's experience went the destructors now at the camp were extremely unsuitable. There were altogether six groups of four destructors each, and it involved almost as much carting to those destructors as to the fields outside the camp. If the destructors were used, the consumption of coal, especially in the winter, would be enormous. Still, it was the way of the War Office, and the council had no means of getting their voice heard in the matter.

Mr. Boughey said he hoped the council would do their utmost to have the sewage matter properly destroyed instead of putting it on the land. He thought the present destructors should be substituted by destructors of a more powerful capacity.

Dr. Beresford said these would cost about £5,000 each.

The chairman said the position was this, that as far as the council knew, within quite a short period their contract for dealing with the scavenging work at the camp would be terminated and the War Office would carry out the work themselves. It was not for the council to dictate to them how they should do it. They must wait, and if they subsequently found that the camp, being in their sanitary area, gave rise to a nuisance then they would be able to step in.

Mr. Peate said the committee did not want to be kept "tinkering" about while the War Office were making up their minds, and the subject of giving them a month's notice to terminate their contract was being dealt with.

The report was adopted.

Sanitary Association of Scotland.—At the annual meeting of the Incorporated Sanitary Association of Scotland last week, the president, Mr. Robert Lambie, Larkhall, relinquished office, and was succeeded in the chair by Dr. Alexander Robb, while the following were elected vice-presidents: Messrs. F. G. Holmes, Office of Public Works, Govan; and John Frew, sanitary inspector, Linlithgowshire. Mr. Holmes is president-elect, and Mr. George Middleton, Glasgow, was re-elected secretary and treasurer. The annual report, which showed the membership to be 444 and the financial position satisfactory, was adopted.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. John S. Brodie, M.Inst.C.E., Borough Engineer and Surveyor, Blackpool.

District Chairman—Mr. J. S. Pickering, M.Inst.C.E., Borough Surveyor, Cheltenham.

SOUTHERN DISTRICT MEETING.

A Southern District meeting is to be held at Bristol to-morrow (Saturday).

Programme.

11.30 a.m.—Assemble at the Council House.

District Meeting.

Election of District Committee.

Informal discussion on papers describing works to be visited.

1 p.m.—Luncheon at Stuckey's Restaurant. (Tickets 2s. 6d. each.)

Drive to the Suspension Bridge, Clifton and Durdham Downs, Eastville refuse destructor, Barton Hill Baths, inspecting *en route* six sections of bituminous road construction laid during the last four years. (Tickets for conveyance, 3s. each.)

6 p.m.—Tea at Stuckey's Restaurant by invitation of the city engineer.

F. R. Phipps,
Hon. District Secretary.

Borough Surveyor.
Basingstoke.

EAST MIDLAND DISTRICT MEETING.

District Chairman—Mr. E. G. Mawbey, M.Inst.C.E., Borough Engineer, Leicester.

An East Midland District Meeting will be held at Melton Mowbray on Saturday, September 23rd.

Programme.

2.0 p.m.—Meet at Colles Hall, where the members will be received by the chairman of the urban district council, Councillor Sholto H. Sikes, Esq., J.P.

District business.

2.30 p.m. Paper, entitled "The Municipal Works of Melton Mowbray," by Mr. Edmund Jeeves, surveyor to the urban district council, to be followed by discussion.

4.0 p.m.—Tea, by kind invitation of the chairman of the council.

4.30 p.m.—Walk to destructor pumping station.

5.0 p.m.—Walk to Sewage Disposal Works.

5.45 p.m.—Return to Melton by way of Cattle Market. (The distance to be walked is about a mile each way.)

In order that the necessary arrangements may be made, members intending to be present must give notice of their intention not later than Saturday, September 16.

W. H. A. Court,
Hon. District Secretary, pro tem.

Borough Surveyor's Office,
Leicester.

NORTH-EASTERN DISTRICT MEETING.

District Chairman—Mr. J. P. Wakeford, M.Inst.C.E., City Engineer, Wakefield.

A North-Eastern District meeting is to be held at Wath-upon-Dearne on Saturday, September 30th.

Programme.

10.15 a.m.—Meet at waterworks pumping station, adjoining Wath-upon-Dearne (G.C.Rly.) Station, and five minutes' walk from Wath-upon-Dearne Midland Station. Proceed to inspect the plant.

10.30 a.m.—Walk alongside the G.C. Railway to the new sewage disposal scheme in course of construction.

10.45 a.m.—Proceed to inspect the sewage disposal works.

11.30 a.m.—Proceed by motor 'buses from near Messrs. Stanley's oil works at Common-lane, along the main road *viâ* Barnsley-road and Brampton to Wath Wood reservoirs to inspect works there recently carried out. *En route* inspections will be made of the public baths, mortuary, sections of Tarmac roads, and private street works.

12.45 p.m.—Leave reservoirs by motor 'bus.

1 p.m.—Lunch at the Red Lion Hotel.

2.15 p.m.—Proceed to town hall, where the institution will be welcomed by the chairman of the urban district council, Councillor Chas. Adkins, J.P.

Business:

(1) Minutes of last meeting.
(2) Correspondence.
(3) Election of executive committee.
(4) Any other business.
(5) Orphan Fund and support from N.E. District.
(6) Paper on "Notes of Municipal Works and Statistics in the Urban District of Wath-upon-Dearne," by Mr. J. H. Drew, M.Inst.C.E.I., M.R.San.I. (Member), engineer and surveyor to the urban district council, Wath-upon-Dearne, will be discussed.

5 p.m.—Tea at the Red Lion Hotel, by kind invitation of County Councillor Richard Payne, member of the Wath-upon-Dearne Urban District Council.

In order that the necessary arrangements may be made, members intending to be present must give notice of their intention not later than Monday, September 25th.

EASTERN SUB-DISTRICT MEETING.

District Chairman—Mr. H. T. Wakelam, M.Inst.C.E., County Engineer, Middlesex.

An Eastern Sub-District Meeting (Norfolk, Suffolk and Cambridge) will be held at Stowmarket on Saturday, the 30th September, 1916.

Programme.

11.30 a.m.—Meet at the Stow Board Room (Market-place) where Mr. A. E. Ellis, J.P., chairman of the Stowmarket Urban District Council, also chairman of the Joint Sewerage Committee, will receive the members.

Read minutes of previous meeting.

Paper on "Municipal Engineering Work at Stowmarket," by Mr. Gerald W. Lingwood. (Copies of paper will be sent to members who signify intention of attending.)

1 0 p.m.—Lunch at the Fox Hotel. (Tickets, 2s. 6d. each.)

2.15 p.m.—Inspect sewage works, main sewage pumping station, waterworks, electric light works, Combs electric sewage pumping station and Combs waterworks.

4.30 p.m.—Afternoon tea at the Fox Hotel, by invitation of Mr. G. W. Lingwood.

It is suggested that members wishing to bring forward matters for private and informal discussion—such as questions of practice, construction, by-laws, &c., should mention this to Mr. Mead early in the meeting.

Opportunity for inspecting works and places of interest will be afforded members who arrive at Stowmarket during the morning and have mentioned their desire to do so when sending notice of their intention to be present at the meeting.

All members of the institution are cordially invited to attend. In order that the necessary arrangements may be made members must give notice of their intention to be present as soon as possible, and not later than Saturday, the 23rd inst.

John R. Mead,
Hon. Sub-District Secretary.

Ipswich.

MUNICIPAL TRAMWAYS ASSOCIATION.

ANNUAL MEETING PROGRAMME.

The annual meeting of the Municipal Tramways Association will be held at the Surveyors' Institution, Westminster, on Thursday and Friday, September 21st and 22nd.

The proceedings will open at 11 o'clock on the Thursday, when Mr. Peter Fisher, general manager of the Dundee Corporation Tramways, will deliver his presidential address.

The following papers will be submitted for discussion:—

"Some Notes on Passenger Transportation in Large Cities," by Mr. J. M. McElroy, general manager of the Manchester Corporation Tramways.

"Utilisation of Tramways for Goods Traffic," by Messrs. G. W. Holford, general manager of the Salford Corporation Tramways, and W. Clough, general manager of the Bury Corporation Tramways.

The Surveyor

And Municipal and County Engineer.

Vol. L. SEPTEMBER 22, 1916. No. 1,288.

Minutes of Proceedings.

Housing After the War.

Some time ago we called attention to a conference on the general subject of housing after the war, which was held under the auspices of the National Housing and Town Planning Council and in particular on the necessity for municipalities being prepared with adequate schemes for the erection of workmen's dwellings. With a view to bringing the resolutions passed at the conference to the notice of the Government, a deputation was received on Wednesday afternoon by Mr. Walter Long, the President of the Local Government Board. The first resolution directed attention to the critical need for the provision of additional housing for the working classes, and, in view of the national interest and responsibility in the matter, urged upon the Government to set aside a sum of £20,000,000 to make such advances to local authorities and other agencies to enable them to provide houses at reasonable rentals. In support of this the deputation pointed out that it is beyond question that the number of houses built annually for the past few years has not sufficed to meet the normal needs of the population, so that immediately prior to the war there was a pronounced shortage of accommodation. This shortage will inevitably be accentuated by the war, for not only has the building of new houses practically ceased during the past two years, but there has been a very considerable increase in the marriage rate. The question therefore arises as to whether private enterprise can reasonably be expected to provide for the deficiency? It is feared that the answer to this question is a negative one; and if this fear be justified, it follows that municipal building will have to be undertaken on a much larger scale than hitherto. A further reason, if one be needed, for immediately proceeding with the preparation of schemes is to be found in the desirability of being prepared in advance to meet a possible crisis of unemployment in the building trade.

It may be assumed, therefore, that municipal building on an extensive scale will be necessary if after-war conditions are to be met satisfactorily; while at the same time the increased cost of materials and the high price of money will render it more impossible than ever to provide cottages at economic rents without being a charge on the local rates. In suggesting Government grants in aid, the deputation were only asking them to follow the precedent already set in the framing of the terms for lending the four millions provided under the Housing (No. 2) Act, 1914, and to continue the practice of the Treasury in regard to loans for the provision of houses for munition workers. The immediate practical step suggested was that the Housing Departments of the Local Government Board for England and Wales and the Local Government Board for Scotland should be brought into full activity in order that the Government may, through these departments, stimulate local authorities and other agencies throughout the kingdom to place in hand without delay the preparation of schemes. The deputation also referred to the question of town planning, and in this connection urged that housing schemes should not be undertaken in any district without reference to its town planning requirements. There can be no doubt that it is desirable that in all future housing schemes the areas on which the houses are to be built should be properly planned, not only locally, but also with reference to adjoining estates and the requirements of the district generally. Another reason for pressing forward at once with the preparation of town planning schemes is the permanent utility of the work (which has the advantage of practical absence of initial expense), and its possible usefulness in connection with the employment of unskilled labour after the war. It is very satisfactory that the conference of last Spring was not allowed to be regarded as an end in itself, but rather as a means of assisting the Government in defining a definite policy with regard to the important questions raised.

* * *

Motor Vehicles for Municipal Work.

So many local authorities are now considering the question of substituting mechanical traction for horse haulage that the exhaustive report on the subject by Mr. H. Shaw, the engineer to the Ilford Urban District Council, a further instalment of which we publish this week, is of much more than local interest. It is now well recognised that, under favourable conditions, motor vehicles are distinctly more economical for various kinds of municipal work, but it is equally well known that the absence of such conditions will inevitably lead to failure. The most important factor to bear in mind is undoubtedly the necessity for avoiding short journeys and constant stoppages. In dealing with other conditions of successful working, Mr. Shaw pointed out, in the first place, that Ilford has the advantage of good and level road surfaces, while the town also possesses workshops and engineering appliances which afford excellent facilities for quick repairs. Further, in order that the maximum degree of economy may be attained, it is essential that the motors should be kept continually working. Indeed, it may be said that the financial result will be satisfactory in direct proportion to the daily number of hours worked by the motor. It is therefore clearly desirable that all bodies should be interchangeable, so that no time may be wasted by having a chassis unnecessarily idle. Finally, full loads, up to the maker's guaranteed capacity, should always be carried; and the whole machine should be constantly maintained in the highest state of efficiency.

Once it is decided to adopt motor traction for work in any district, it becomes necessary to con-

sider the question of motive power. There are four principal types available, driven respectively by steam, petrol, electricity, and petrol-electricity. Writing a year ago, we pointed out that the choice of motive power must depend on the geographical and economic factors operating in the locality where the vehicle is to work. Where coal is cheap, so far as running costs are concerned, neither petrol nor electric driven vehicles are likely to be so satisfactory or economical as steam-driven vehicles. In a hilly district the petrol-driven vehicle is generally more satisfactory; while the reserve of power which most steam engines have in being able, at a pinch, to give a greater power for a short time than the normal horse-power is in many cases most useful, and is not possessed by either the petrol or electric motor. On the other hand, steam-driven vehicles in urban districts are open to objection on account of the noise and smoke they create. An interesting comparison is made by Mr. Shaw between steel and rubber tyres for heavy steam vehicles. Steel tyres, he observes, are more generally used for heavy steam vehicles travelling up to a speed of about 8 miles per hour, but with a vehicle of lighter tonnage travelling 12 miles per hour and upwards the consensus of opinion is that rubber tyres are a decided advantage. They are much faster, which reduces the running cost, and by the resiliency of the rubber a great saving is effected in the wear of the chassis from vibration, which means much longer life to the vehicle. The noise is also eliminated, and the cost, taking all things into consideration, is very little more than steel. In the body of the report there appears a mass of information gathered from a large number of local authorities having actual experience of the use of motor vehicles for municipal work, and Mr. Shaw has rendered a great service in making this available for general use.

* * *

A Further Advance in Water Treatment.

That tastes and odours due to organic growths in water may sometimes be removed or prevented by the use of copper sulphate is well known. The process is exceedingly simple, and it is probably because of this simplicity, and because good results can be produced by rough methods, that the engineer and the chemist have not troubled themselves greatly as to the improvement of the method. The chemist, having discovered that copper sulphate will get rid of algal growths, has generally contented himself with mixing the copper sulphate with the water in the reservoir by the crude method of towing a bag of the chemical behind a boat rowed across the water in the reservoir. It is evident that perfect admixture and economy of the chemical cannot be effected in this manner; who, for instance, would think of applying hypochlorite in this way? It is clear that the result of such rough treatment must be an overdose of some part of the water and the practical omission of the chemical elsewhere. Although in the end a general mixing may be more or less effected, harm to fish life is probably done in the overdosed sections of the water; also, if the dosing were more equal less chemical would be used, and no part of the water would be so much overdosed as to make it harmful to fish life, while the ultimate general result upon the algæ, and consequently on the water, would be better.

In this relation the work of Prof. N. L. Huff and Mr. G. O. House on the water supply of St. Paul, described in a paper read before the convention of the American Waterworks Association in New York, and dealt with elsewhere in these pages, shows that a distinct advance has been made. Under the conditions existing at St. Paul it was found that a treatment of 1 part of copper sulphate to 10,000,000 parts of water remained effective for five weeks. That such an exceedingly small dose as ·01 parts per 1,000,000 should have been effective at once suggests some difference in the method of application, having regard to the comparatively large doses found to be necessary elsewhere. This work was evidently done very carefully and scientifically. In the first place, it was found that certain quiet, shallow pools were breeding places for various organisms, and by applying small quantities of the chemical at such points the main sources of the trouble were checked. Very shallow bays, flat, muddy shores, and small ponds were treated by spraying the chemical over the water surface with a hand pump. It is to be observed that there the worst places would be inaccessible for a boat, and would therefore receive no treatment. Further, that if a boat were taken through shallow, muddy places, much of the chemical would be absorbed by the organic matter stirred up from the bottom. It is clear, therefore, that the old method of towing a bag of chemical through the water of the reservoir is wrong in principle, for, while the cleanest water is overdosed, the worst places remain untouched. In the old method relatively an enormous quantity of chemical is used, most of it in the wrong place. Further, the conflicting reports as to the harmfulness of this treatment to fish life are explained. It seems surprising, in the light of this discovery, that scientific men and engineers should ever have dealt with a matter of this importance by such very clumsy methods.

* * *

Mr. Duke and Irish Housing Problems.

Mr. Duke, the Chief Secretary for Ireland, has done well to identify himself right away with the subject of housing reform in Ireland. His first public speech to an Irish audience in Ireland was delivered recently upon the opening of Stella garden suburb, Pembroke, near Dublin, consisting of 183 working-class dwellings. Mr. Duke pointed with obvious satisfaction, as he was justified in doing, to the fact that the Pembroke Urban Council, as the result of its comprehensive housing policy, has provided dwellings for 759 families in various parts of the district. This has involved the borrowing of no less than £175,000 by way of loan, and it is claimed that the schemes are established upon a self-supporting basis. If this be so—and Mr. Duke was quite frankly somewhat sceptical on this head—it would appear that the path of the housing reformer is a much more rosy and comfortable one in this part of Ireland than it happens to be in many other places in these islands. It was easy in the face of such a claim to financial stability for the scheme for Mr. Duke to assert that the urban council had made a good investment. If they were losing a substantial sum of money instead of making ends meet, they would have to pay off the loans and cut the loss, but instead they are the owners of a property which is producing £10,000 a year, and the Chief Secretary, with what it is hoped is not undue optimism, sees vistas of wealth which he does not doubt the council will apply to further purposes of betterment in Pembroke.

The remainder of Mr. Duke's speech upon this occasion was devoted to a consideration of the housing question in Dublin. This he described as a problem of as tremendous magnitude probably as any problem which in modern times could engage the attention of statesmen. Briefly, it will call for an expenditure of three and a-half millions for the housing of 31,000 families now occupying not more than one room apiece. He pressed home the responsibility for solving this serious problem upon the citizens of Dublin, and while insisting upon its urgency, he declared that, so far as he might have strength or influence, while he had responsibility in this matter, whether

in a public position or a private citizen, he would contribute his part to the material well being of the Metropolis of Ireland. With respect to the financial aspect of the subject, Mr. Duke exercised the caution that is characteristic of the public official, but it may be accepted as a hopeful sign for the future of Dublin housing that a gentleman occupying his prominent position should have thus promptly recognised its importance as a regenera tive agency, while at the same time proclaiming his eagerness to promote a much desired solution of a notorious evil

* * *

The Rainfall of 1915.

Although the operations of that excellent body the British Rainfall Organisation have necessarily been hampered by the prevailing war conditions, we are glad to observe that it has been found possible to produce the usual annual volume, although in a somewhat modified form. The usefulness of these records, obtained and classified on a uniform scientific basis, to water engineers is obvious, and needs no emphasis on our part. The general result is that the rainfall of 1915 was excessive in three large areas particularly, and over the whole country generally. The general excess in England during 1915 was larger than in any other of the great divisions of the kingdom, being 10 per cent of the average. In Wales there was a general excess of 5 per cent, and for England and Wales taken together the fall was 9 per cent above the average. This excess corresponds roughly to 3·20 in. of general rainfall, or, in other words, England and Wales had during the year 2,700,000 million gallons of rain more than the average fall. In Scotland the large dry areas outweighed the smaller wet areas, and the general deficiency amounted to 8 per cent, while in Ireland there was an excess of 2 per cent. For the British Isles as a whole, in spite of the great excess in the South of England, the general rainfall for the year was only 2 per cent above the average, this corresponding to about ·80 in. of general rainfall. The areas of large excessive rainfall were all in the South and East, and, in vivid contrast with this, the rainfall in the North-west was below and in large areas considerably below the average. The general excess in England and Wales, though not large, is significant when taken in conjunction with the fact that of the seven years 1909-1915 only one, 1911, had a rainfall below the average. So far as we are aware, no similar instance of persistent high rainfall has occurred in England and Wales generally for at least thirty years, and it is clear that the South of Great Britain is at present passing through an exceptional period of wetness, similar to that of the late 'seventies and early 'eighties. In Scotland, on the other hand, only two years in the last eight have been wet, and these not excessively so, and it is thus evident that, whatever may be the cause of the high rainfall in the South, it does not extend to the North of the British Isles. In Ireland the same years have shown a preponderance of small excesses, but for the British Isles as a whole the sequence is confused, the excesses in England having in some years counterbalanced the deficiencies in Scotland and sometimes *vice versa*.

* * *

Part-time Firemen.

The position of part-time firemen with regard to military service was under consideration recently by the West Sussex Appeal Tribunal, when the military representative asked for leave to appeal to the Central Tribunal in respect of certain members of the Worthing Fire Brigade, who had been exempted both by the local and the appeal tribunals. He stated that they were only part-time firemen, paid for their attendance at drills and fires. They were granted three months' exemption on the ground that they were firemen, quite independently of any personal reasons. Exception was taken to these exemptions on the ground that there had been distinct orders that part-time firemen were to be accorded no special privileges by tribunals on account of their service in that capacity. In the particular cases under discussion the exemptions had the approval of the Advisory Committee, and the military representative also regarded them as reasonable. He felt obliged to point out, however, that they were not in a certified occupation, as they were not wholetime firemen, and it could not be said that it was in the national interest they should remain, because they were not habitually employed in the occupation of firemen, being roadmen, &c. The average attendance at fires was only seven a year. He quoted further from the instructions: "With very few exceptions no fireman of military age can be considered indispensable or irreplaceable." The tribunal gave leave to appeal to the Central Tribunal, whose decision will be awaited with interest.

* * *

Afforestation.

Among the many important subjects discussed at the meeting of the British Association recently, not the least important from the national point of view was that of Afforestation, upon which Sir J. Stirling-Maxwell read a paper before the Botanical Section. Sir John is a member of a Government Committee that is inquiring into this question, and, though not putting forward the figure officially, he hinted that our national policy ought to aim at a further 1,500,000 acres being planted, in addition to restoring the existing areas of woodland now being rapidly cut down to meet the exigencies of the war. In the past we have looked at this question entirely from the standpoint of profit and loss. That is entirely wrong. No other country looks at it solely from this point of view. Properly tackled the problem will involve no loss, for afforestation will employ ten men where the same area of grazing would only employ one. While not suggesting that these islands could be made entirely self-supporting and independent of imported timber, Sir John set before his audience the ideal of a self-supporting British Empire. As regards the British Isles, he pointed out that if the total area under afforestation could be increased to 6,000,000 acres, this would at least carry us over a period of five years during a war or any other emergency. In view of the urgency of the question, it is satisfactory to note his remark that this Government is doing more towards finding a solution than all its predecessors put together.

* * *

Selection of Sites for Baths.

A point of some importance to local authorities who may be contemplating the erection of public baths was raised in the paper which Mr. H. W. Harding, chief engineering assistant to the city engineer of Bristol, contributed to last Saturday's Southern District meeting of the Institution of Municipal and County Engineers. The site of the Bristol Corporation's Barton Hill baths was originally a piece of surplus land from a street improvement, supplemented by additional property adjoining, acquired by purchase. This site, though excellently situated in the centre of a large artisan neighbourhood, is, unfortunately, not on a main road, and was of irregular shape and far too small to allow of any liberal treatment in designing the buildings. As Mr. Harding observed, this is a mistake often made, sometimes unavoidably, in the selection of a site in crowded localities, where land is expensive, but a limited area necessarily cripples any plan, however well considered, and the inevitable result is that the several buildings are crowded together with insufficient air space and limited means of intercommunication.

Chlorination of Water.

By CAPTAIN J. RACE, Canadian Army Hydrological Corps.

In The Surveyor of March 3, 1916, page 253, four certain experiments were described which indicated that the germicidal effect of hypochlorite could be considerably enhanced by the addition of an equivalent of ammonia. The difficulties encountered during the translation of the laboratory experiments to the practical working scale were also given, and it was suggested that the loss of available chlorine noted after the admixture of the aqua ammonia and bleach solution could be eliminated by permitting these solutions to mix for only a few seconds before being discharged into the water that it was desired to treat.

The dosing apparatus in the experimental plant referred to (capacity, 200,000 gallons per day) was rearranged and the dilute bleach and ammonia solutions, after passing through the usual controlling apparatus, were brought together in the injection pipe at a point 8 ft. away from the raw water intake pipe. In this way the period of contact, before thorough dilution with the raw water, was reduced to a minimum.

After the adoption of this method of admixture, excellent results were immediately secured, and the dosage was gradually reduced until the purity of the treated water was adversely affected. The dosage was retained at this figure, approximately 0·23 parts per 1,000,000 of available chlorine and 0·12 parts per 1,000,000 of anhydrous ammonia, for a period of several weeks. The results of the daily tests, together with those of the main plant, where 20,000,000 gallons per day were being treated with straight hypochlorite, are given in the following tables:—

necessary in order to prevent complaints. The cost of raising the temperature of the water 20 to 25 deg. Fahr. quickly became a serious financial consideration, and the author was requested to suggest some method of disinfection which would enable the water to be retained for at least seven days. Hypochlorite was first used, but even with doses as high as 3 parts per 1,000,000 of available chlorine, aftergrowths rapidly occurred, and total bacterial counts of 50,000 to 100,000 per c.cm. were repeatedly found; the B. coli index was usually 2 to 5 per c.cm.

Hypochlorite treatment at this dosage was a total failure, and it was deemed undesirable to use larger amounts, on account of the tendency of hypochlorite to cause irritation to mucous membranes.

Chloramine treatment was next used, and after the attendant had become thoroughly conversant with the proper method of application thoroughly satisfactory results were secured. The treatment finally adopted was 1 part per 1,000,000 of chlorine together with 0·5 parts per 1,000,000 of ammonia, and this treatment, when conscientiously carried out, produced a water containing less than 100 bacteria per c.cm. and free from B. coli.

The elimination of aftergrowths by the chloramine treatment is due to the non-absorption of the germicide so that all of the added substances are available for the destruction of bacteria.

It has been suggested that the influence of the ammonia is to increase the oxidising activity of the chlorine, but this view is not supported by the evidence

COMPARISON OF HYPOCHLORITE AND CHLORAMINE TREATMENT.

Calculated on bleach at 14s. 7d. per 100 lb. and aqua ammonia (26° B.) at 2·75d. per lb.

These results have demonstrated that the process is eminently practical and can be used to advantage when bleach is abnormally high in price

A further example of the efficiency of this process was found during a series of experiments on the disinfection of the water of a swimming pool at the Ottawa Y.M.C.A. This pool was being extensively used by the various military units stationed in Ottawa in addition to the members of the association, and it was found that frequent changes of water were

available. If the oxidising effect were accelerated, the mixture would be even more readily absorbed by waters containing readily-oxidisable organic matter than hypochlorite alone. Experiments demonstrate the reverse, for it was found that on adding 10 p.p.m. of available chlorine as hypochlorite to the Ottawa River water, about 35 per cent was absorbed in five minutes at 60 deg. Fahr. and 60 per cent within one hour; if an equivalent of ammonia were first added to the solution, only 1·4 per cent of the available

chlorine was absorbed in one hour and 3·2 per cent. in twenty hours.

Again, the oxidising effect of hypochlorite can be measured by its bleaching effect on dyestuffs, and Rideal (*Journal of the Royal Sanitary Institute*, vol. xxxi., No. 2 (1910), p. 40) has shown that the addition of an equivalent of ammonia to hypochlorite solutions reduces the bleaching efficiency to approximately 2 per cent of the original value; these results have been confirmed by the author, and conclusively prove that the enhanced germicidal effect of chloramine is in no way connected with oxidation.

Further studies on substances containing the chloramine group (·NCl) by Dakin *et al.* (*Journal of the Royal Society*, 1916, B. 89, 232-251) would suggest that the usual conception of the germicidal effect of chlorine and hypochlorites being due to oxidation may be erroneous, and that the action should be at least partially attributed to the chloramine derivatives produced by the action of chlorine on amino acids and protein.

BITUMINOUS ROADS IN BRISTOL.

The subjoined particulars of six sections of bituminous road laid at Bristol during the past years were circulated at last Saturday's Southern District meeting of the Institution of Municipal and County Engineers, held in that city. An inspection of the several roads was made by the members in the course of the afternoon.

PRINCE STREET.

This road is subjected to a considerable amount of quay-side traffic, and was originally a macadam road. This form of construction proving very unsatisfactory and costly, in 1905 a twenty-years loan was obtained to pave it with granite setts on 6 in. of Portland cement concrete. Unfortunately, the setts used proved too weak for the traffic to be carried, and after eight years the surface became very uneven. The period of the loan not having expired, any work carried out had to be done out of revenue, and an experiment was made with a bituminous sand carpet, formed of Mexphalte and Bideford sand. The camber on the road being very flat, and the contractors being very doubtful whether a single carpet 1 in. thick would carry the very heavy traffic, it was arranged that a rough coat of ¾ in. limestone aggregate, mixed with sand and Mexphalte, should be laid on the top of the setts, starting from nothing at the channels to 2½ in. in the centre, and a 1 in. carpet of sand and Mexphalte laid on the top over the whole surface. The cost was 5s. per yard, including three years' maintenance, which expires this month, and the result on the whole has been satisfactory. An inclination to waviness has shown itself, and small areas have consequently been relaid, and in the extremely hot weather the material shows a tendency to become rather soft, making traction additionally heavy, probably due to a little excess of bitumen. Before laying the bottom coat the surface of the setts was thoroughly cleaned and the joints opened out as much as possible, and the surface painted over with a solution of bitumen to form a key.

QUEEN'S ROAD.

A 3-in. single coat of bituminous macadam formed of graded limestone from 1 in. to dust mixed with sand and Mexphalte was laid on a concrete foundation in place of wood paving which had been down for fifteen years. This was done to ascertain if there was any advantage in laying bituminous macadam on a concrete foundation. The cost was 5s. 4d. per yard, including three years' maintenance, which terminated last July. This is a motor 'bus route, and the material has stood very well.

PEMBROKE ROAD (TWO SECTIONS).

The first section was laid in 1915, and is a 1 in. carpet laid on the surface of the old macadam road, composed of Bideford sand and Mexphalte, and cost 5s. per yard, without maintenance. The second section was laid in 1912, at a cost of 2s. 6d. per yard, and is a 1-in. carpet laid on the old macadam road and composed of sand, Mexphalte, and a small percentage of crushed granite. This was laid before much experience had been gained in laying these carpet coats on old macadam roads, and a number of small holes were picked in the surface of the road, with a view to forming a key with the surface coat; the road was then painted over with a bituminous solution, and apparently this drained into these holes, with the result that this excess of bitumen has worked through the carpet, and shows a series of patches on the surface. This road, although apparently a residential road, carries a lot of heavy traffic, the gradients being easier to the Downs than the main road, and, as a matter of fact, in 1912 the bulk of the machinery, &c., taken to the Royal Show on the Downs passed along this road.

SUSSEX PLACE.

This is a motor 'bus route, and was laid in 1914. It consists of a carpet of Mexphalte and sand, with about 8 per cent of crushed granite, laid 1½ in. thick on the surface of the old macadam road, at a cost of 5s. per yard, including three years' maintenance. This is one of the most successful lengths of carpet laid in Bristol.

RICHMOND STREET.

Laid down in 1912. This was the first bituminous carpets laid in Bristol, and consists of a layer of Mexphalte and sand, laid on a rough cobble road, and at a cost of 1s. 8d. per yard super., which, of course, did not pay the contractors. The cobble paving was extremely noisy, and, as many railway employees live in this street and have to sleep in the daytime, this was done with a view to making the street quieter. The traffic in this street is light.

EASTON ROAD.

This was a macadam road, subject to heavy traffic, including a motor 'bus route, and was expensive to maintain. In 1915 a 1½-in. carpet of Mexphalte and sand was laid on the surface of the old road, at a cost of 4s. 10d. per yard, including three-year maintenance, and so far has been a pronounced success. A short experimental length of carpet, composed of crushed destructor clinker and Mexphalte, was laid down on the lines of the method introduced by Mr. Lovegrove at Hornsey, and is standing very well.

THE "ROAD PARTY" MAN IN SOUTH AFRICA.

(By a Correspondent.)

The "official" residence of the "road party" man in the up-country districts of South Africa consists of a couple of tents. Near by are the huts of the "boys," and in the intervening space is the Scotch cart. This Scotch cart is the line of demarcation, and in non-working hours no boy is allowed to pass it. If any of the men desire speech of the Baas they take up their position near the cart and await his coming.

The number of boys in a gang depends on the nature and distance of the stretch of roadway each man is responsible for. In some gangs as many as 80 and 100 boys are employed, while others may only total half this number.

The boys are paid ten shillings a month, with a daily allowance of mealies and a monthly allowance of one beast to every forty men. The volume of traffic along these roads is insignificant, but what it lacks in numbers it makes up for in vigilance. Should the post cart be delayed, or a wagon upset, or get stuck for any length of time, the "road party" man on that stretch has to explain why this happened. As a consequence there is often a strained feeling between the man who keeps the road in going order and those who travel over it.

The road man's life is one series of flittings from one part of his district to another, and the Scotch cart and oxen are never left long idle. The first day of arrival at a new pitch is given over to the boys to build their huts and clear the ground round the encampment of long grass. The hours of work are supposed to be ten, but as watches go wrong and the sun has to be substituted as a timekeeper, they are not so strictly kept. In the dry season the life, if monotonous, is a pleasant and healthy one; but in the rainy weather when the water comes down from the hills in rivers and the bed of the roadway sinks, it is far different. It is at this period that the strained relationship between the "road party" man and the post-cart driver and transport rider becomes intense.

Municipal Waterworks Association. — The fifth annual meeting of this body will be held on Friday, October 6th, at the offices of the Metropolitan Water Board, Savoy-court, Strand, London, W.C. The chair will be taken at 2 p.m.

Electric v. Horse Haulage: South Shields Statistics.

The appended statistics of the running costs of an electric motor vehicle with comparative costs as against horse traction have been prepared by Mr. Leslie Roseveare, M.INST.C.E., borough engineer and surveyor of South Shields.

RUNNING COSTS OF TWO-TON ELECTRICAL REFUSE VAN PER WEEK (BASED ON THREE MONTHS' RUNNING).

—	Present rates. 1¼d. per unit as at present.	Present rates. 1d. per unit as proposed.	Pre-war rates. 1¼d. per unit as at present.	Pre-war rates. 1d. per unit as proposed.

NOTE.—Ton mile estimated on the total mileage for any period multiplied by the average number of tons carried each trip, viz., the average of the loaded and return empty journey.

BRISTOL TRAMWAYS.

PROPOSED MUNICIPAL ACQUISITION.

The negotiations between the Bristol Corporation and the Tramways Company in connection with this proposal being in abeyance consequent upon the war, the committee entrusted with the corporation's interests has taken the opportunity to present a detailed report of the position of the matter, with a statement of the costs incurred in obtaining the further Parliamentary powers deemed necessary, and in obtaining expert advice upon the question as to the advisability or otherwise of the corporation purchasing the tramways.

The costs total £8,068, the principal items being as follow:

Counsel's fees: Sir R. B. Finlay, K.C., £15; Hon. J. D. Fitzgerald, K.C., £458; Mr. G. J. Talbot, K.C., £301; Mr. F. T. Squarey, £239; Mr. E. T. Jones, £201 (Total, £1,217).

Parliamentary agent: £1,020.

Expert witnesses: Sir John Snell, M.I.E.E., £1,198; Mr. C. P. Sparkes, M.I.E.E., £343; Sir M. Fitzmaurice, M.INST.C.E. (retainer), £157; Mr. Andrew Young, F.S.I. (retainer), £105; Mr. J. B. Hamilton, £1,342; Mr. J. M. McElroy, £330. (Total, £3,475.)

Census of tramcar and motor bus traffic: £478.

Printing, advertising, billposting: £86.

Maps and miscellaneous costs: £675.

Poll of city: £869.

The committee point out that the opposition from the Tramway Company and certain ratepayers curtailed approximately about £3,000 of the above total.

Rural Council's War Saving.—Driffield Rural District Council are investing in Exchequer Bonds a sum of £2,500 saving since the outbreak of war owing to their inability to buy road-making materials.

TWO-INCH WOOD BLOCK PAVEMENT.

AN AMERICAN EXPERIMENT.

In October, 1913, a 100-ft. strip of experimental paving was laid in one of the residential streets of Tacoma, Wash., using creosoted wood blocks only 2 in. deep. Inquiry recently by the *Canadian Engineer* brought a reply stating that the pavement is, in general, in good condition. "There has been no heaving. A portion of the pavement which was laid on a concrete base that had a sidewalk finish has apparently separated from the foundation, but this could be prevented in future work. The blocks showed excessive bleeding, but this also could be prevented by different treatment. The street receives very heavy traffic for a residential street, inasmuch as it is the only one used for carting between the two main streets of Tacoma, and it is on the right-hand side leading out of the city, thus getting the traffic of the heavily loaded teams. With the exception of where the joint was made with the asphalt paving, and which slipped up over the blocks, necessitating the cutting away of the asphalt, no expenditure has been made for upkeep on this experimental pavement."

The blocks laid at Tacoma were only 1¼ in. wide by 3¼ in. long. They were Douglas fir, treated with approximately 18 lb. per cubic foot of creosote. On account of the small size, excellent penetration and uniformity of grain were more easily obtained than with blocks of standard size.

The blocks were laid on a concrete base 14½ ft. wide. The pavement was divided into four sections, each 25 ft. long, as follows:—

(1) Blocks laid with long axis at right-angles to the line of traffic, on a 1-in. sand cushion; broken joints, blocks rammed tight.

(2) Blocks laid at an angle of 67½ deg. to line of traffic, on a 1-in. sand cushion; rammed tight and joints broken as in section 1.

(3) Blocks laid on a 1-in. cushion made of 1 part of cement to 3 parts of fine sand, mixed and spread dry; blocks laid with long axis parallel to the kerb, making unbroken joints along the line of traffic; at right-angles to the kerb, joints are broken.

(4) Blocks laid in the same manner as in section 3, excepting that they are bedded in grout of 1 part cement to 3 parts sand, mixed wet enough to take a smooth trowel finish.

"The crushing strength of 2-in. blocks," our contemporary observes, "is said to be approximately as great as the crushing strength of the larger blocks, and as there is not likely to be 2 in. of actual wear during the lifetime of the pavement if the blocks do not rot, break or crack, the 2-in. block would seem to be feasible with proper treatment, provided that they are made so small that the impact of traffic will not break them. The cost of laying the smaller block would, of course, be somewhat higher than the cost of laying the larger block, but this would undoubtedly be far more than offset by the reduced cost of the materials. The further progress of the Tacoma experiment undoubtedly will be watched with interest by municipal engineers."

Waterproofing of Cement Work.—The historic castle of Cape Town, erected by J. Van Riebeeck, the first Governor of South Africa, in the days when the Dutch originally settled in Cape Colony, has been restored. A letter has been forwarded by the Council of the National Society, thanking General Thompson for the very able manner in which the work has been executed. We note from the report that the powder Pudlo was adopted for making the cement work damp-proof and watertight.

Clifton Suspension Bridge Road Levels.—A peculiar feature of the Clifton suspension bridge, mentioned by Mr. L. S. McKenzie, the city engineer of Bristol, in a paper prepared in connection with last Saturday's Southern District Meeting of the Institution of Municipal and County Engineers, is that the road level on the Somersetshire side is 3 ft. lower than that on the Gloucestershire side. It is stated that Brunel was of the opinion that the configuration of the land on each side would have had the effect of causing a level bridge to appear to be out of level, and it was to counteract this effect that the different levels were adopted.

The Use of Motor Vehicles in Municipal Work.

MECHANICAL *v.* HORSE TRACTION.—(2.)

By H. SHAW, M.INST.C.E., Engineer and Surveyor to the Ilford Urban District Council.

[In the following exhaustive report, prepared for the information of the Works Committee of his council, Mr. Shaw presents a mass of valuable facts and figures derived from the experience of various municipalities, and from his own knowledge, as to the advantages and disadvantages of mechanical versus horse traction, and discusses in detail each method of propulsion in order to enable the committee to decide whether the council's work can be carried out to greater advantage by the substitution of horse labour by mechanical traction. The first portion of the report appeared last week.

Edinburgh. This city has an electric lorry, which is used for general purposes. The nett carrying capacity is 30 cwt., and is of the Edison Accumulators, Limited, manufacture. The wheels are wooden, with rubber tyres, and the working cost is as follows:—

Electricity per mile, ·95 units. Lubrication per mile, ·005d. Maintenance, ·52d. per mile. Interest and sinking fund, 5·2d. per mile. Insurance, ·36 per mile.

Essex County Council.—Four 4-ton petrol lorries (McCurd's). Steel bodies, with hand-tipping gear. Steel wheels and rubber tyres. Running cost per ton-mile.

Folkestone. Two 18-50 h.p. petrol vehicles.

"I think I am safe in saying steam rather than petrol for refuse collecting, but petrol rather than steam for fetching and carrying road materials where long distances with good loads can be relied upon instead of, as in refuse collecting, a very small mileage and load with engines running all day."

Glasgow.—Two 30-h.p. petrol hand-tipping (3 tons), several Laffly & Lacre motor sweepers.

"While no economy can be claimed in the case of the refuse removal wagons, the street watering machines on the other hand have proved highly serviceable and more economical than horse haulage. The vehicles are not equipped with interchangeable bodies.

"I may say that my committee has practically decided to introduce two electrically propelled vehicles for the collection and removal of domestic refuse, and I have every reason to believe that for such work electric vehicles will prove their superiority over petrol wagons and be more economical than horse haulage."

Great Yarmouth.—Three to five ton (about 8 h.p.) tipping wagons. (Mann's, Aveling & Porter, Garrett—steam.)

"I have three wagons; Mann's nearly three years, Aveling's and Garrett's two years. I am finding them extremely economical. It is possible by selecting work to reduce cost to half that of horse hire, and, after deducting 12½ per cent per annum for depreciation, my average saving is 33 per cent. I have some long distances which makes this possible."

Hambledon. One 10-h.p., 5 tons, petrol (Dennis), side tipping. Haulage.

Running Costs from July, 1914, to July, 1915.
Mileage, 11,184.

Comparison.

Prices obtained for carting by contract	951	0	6
Cost of running motor ...	629	7	5
Saving	£321	13	1

Hammersmith.—One 32-h.p. (3½ tons) sheet-steel tipping body, interchangeable with cylindrical tipping water-tank body (750 gallons capacity). Used principally for scavenging and watering. (National Steam Car—steam.)

"This has been engaged in collecting house refuse, but cost was greater than when horses were employed. We discontinued using it for this purpose, and now use it for general haulage work. The National Steam Car Company are making an interchangeable water-tank for this motor for street watering purposes, and I am of opinion that this will prove the most economical work on which the motor can be employed."

Haslingden.—Three-ton vehicle; steam. Yorkshire Commercial Motor Co. Used for hauling granite, flags, setts, and general stores. Separate water-tank which can be lowered into body—capacity of 800 gallons, fitted with American sprinklers. Cost complete with water body, £640. The surveyor unable to give running costs owing to shortage of staff.

Kent County Council.—Ten lorries for haulage purposes. (J. & E. Hall, Limited—petrol.)

"In 1910 the county council purchased two lorries, and this number was subsequently increased to ten. For our work we were satisfied that they were a good investment. In pre-war days the average mileage travelled was approximately 13,500 miles per annum, the consumption of petrol varied from 43 to 45 per mile, and the average daily working cost from £1 7s. 7d. to £1 9s. 5d. The cost of these lorries originally was, in round figures, £780. We have not used any interchangeable bodies. Cost of haulage of material per ton per mile is, in the case of lorries, about 6d., and with the horsed vehicles 1s."

Kingston-upon-Thames. — One 5-ton "Overtype" wagon, with interchangeable body—viz., water tank (1,000 gallons) and sprinklers, with Gwynne's centrifugal pump and hose pipe. (Mann's—steam.)

Cost, £560 10s.

Running Cost for 1915 (195 working days) is as follows:—

	£	s.	d.
Coke	33	4	3
Oil	4	2	1
Waste and packing	2	4	2
Insurance	6	18	0
Repairs and renewals	31	16	7
Depreciation (paid out of revenue).			
Driver's wages, 37s. 6d.; assistant, 17s. per week.			

"I consider the corporation have saved 2d. to 3d. per mile by the adoption of a motor in comparison with horsed vehicles. The wagon does the work of three to four horses."

Leeds.—Six of Messrs. T. Green & Sons' motor sweepers in use.

One motor sweeper equals 2½ horses. Running cost per mile, 7·1d. (mileage, 38 per eight hours' shift). Width of brush, 7 ft.

Leicester.—One steam wagon, which is now used for sewer flushing purposes, and was supplied in 1905 by Savage Brothers. It is a 4-ton steam tipping wagon, fitted with interchangeable bodies. Water body holds about 900 gallons. Dry body about 5 cub. yds. Answers its purpose admirably.

One Laffly petrol motor-sweeping machine supplied by W. & F. Archer, Edmonton, London. Working satisfactorily.

Leyton.—The engineer and surveyor reported to his committee in February of this year, and the figures shown in his report were based on information received. The report showed the cost per week over a period of four years (three actual and one estimated) for dust collection (average 20,557 tons) to be £66 4s. 3d. per week. By electric motor vans (2 tons) he estimated the cost per week (capital, maintenance, &c., with a ten-years' loan) to be £60 17s. 4d., and with a four-years' purchase cost £80 6s. 6d. per week. The saving in ten years, with a ten-years' loan, would be £2,780, and with a four years' purchase cost he estimated a loss for the first four years of £2,936, and for the following six years a saving of £6,645, or a nett saving over the ten years of £3,709.

London (City).—Four 3-ton (7 yds. cube) dust wagons, interchangeable with water bodies (700 gallons capacity). (Thornycroft—steam.)

The corporation has ordered six "J" type Thorny-

craft petrol motors in place of above (one only supplied).

"These petrol wagons have a carrying capacity of refuse of 3 tons, and are fitted so as to be utilised either for collection of refuse or for street watering. For the latter purpose they are both efficient and economical, but not quite so economical for the collection of refuse."

Luton.—One 5-6-ton high pressure steam tractor, three trailers. (Aveling & Porter—steam.)

"Purchased in 1910. Tractor cost £405; trailers each £60. Used in connection with the sewage disposal scheme, which involved the carting of some 30,000 cub. yds. of filtering material for a distance of about 2 miles. The tractor was entirely satisfactory, and paid for itself on that one job. Under regular conditions of work I find it costs about 6d. per ton per mile, and is thus much cheaper than horse haulage, when there is regular work for it. Under normal conditions I find that I am able to keep the tractor economically employed during most of the year."

Newcastle.—Machines on order, but not yet delivered. Recommends steamer.

Norwich.—Three wagons; 4, 5 and 6 tons respectively. Tipping bodies interchangeable with watering. (Yorkshire Commercial Motor Company—steam.)

The three wagons are of the standard types manufactured by the Yorkshire Commercial Motor Company. They are used entirely for the carting of macadam, coal, coke, and soil, and in summer alternatively employed for watering suburban roads. When carting macadam, quick loading is ensured by employing an electric crane and grab bucket and quick discharge by tipping. A certain amount of rough spreading is carried out as the wagon travels. Thus the wagons are made to show a satisfactory cost charge on such short haulages.

Great care is taken that, so far as possible, the full tonnage of the wagon is carried at each load.

Running costs during year ended June 25, 1913:

Steam wagon "A" (4 tons), 11 years old	
Miles per load (average)	2·182
Cost per load (average)	8s. 6·315d.
Cost per load per mile	3s. 10·895d.
Cost per ton per mile	11·7d.
(Depreciation at 10 per cent included.)	
Steam wagon "B" (5 tons), 8 years old	
Miles per load (average)	1·963
Cost per load (average)	7s. 7·365d.
Cost per load per mile	3s. 11·34d.
Cost per ton per mile	9·5d.
(Depreciation at 10 per cent included.)	
Steam Wagon "C" (6 tons), 5 years old	
Miles per load (average)	1·3
Cost per load (average)	4s. 2·277d.
Cost per load per mile	3s. 2·67d.
Cost per ton per mile	6·5d.
(Depreciation at 10 per cent included.)	

Each commodore is charged 4s. per hour, which is slightly more than the actual cost of running.

The hiring rate per day for horse in this town was 7s. 3d. per day. In the district, when watering, a van covers about 9½ miles per day, at a cost this year of 12s. 6d. per horse and team. The gallons of water distributed are approximately 7,400. When scavenging one-horse cart and man collects about and tips 3½ loads of sweepings per day, at a cost of 12s. 6d.

Nottingham County Council.—"I have only one steam tipping wagon belonging to this county council. This wagon was purchased in October last, and I am afraid that the short time it has been at work is not sufficient to obtain any definite information as to the cost, &c.

"I may say, however, that the wagon was made by Messrs. C. Burrell & Sons, of Thetford, and supplied along with two trailers at a cost of £800. Up to now the cost of haulage has worked out at 3½d. per ton-mile, as compared with about 10½d. for hired tractors or steam wagons.

"The County Highways Committee are about to purchase another of these tipping wagons from Messrs. Clayton & Shuttleworth, Limited."

Paignton Urban District Council.—One 5-h.p. (5-ton) wagon, tipping body, interchangeable with watering tank. (Foden, steam.)

"Has proved to be a great economy and convenience, especially for long journeys and in street watering."

Pontypridd Urban District Council.—Two 16-h.p. (5-ton) wagons, interchangeable water tanks and wagons for house refuse. (Leyland—steam.)

"These are now about ten years old, and are becoming rather expensive in repairs. I estimate that the cost per ton for collection and haulage works out from between 3s. 3d. to 3s. 6d.

"At present I am obtaining particulars and prices of electrically propelled vehicles to replace my present steamers."

Portsmouth Town Council.—(1) One wagon (Savage steam).

(2) One water tank, fitted with adaptable rollers for use as light road roller (Mann's—steam).

(3) One wagon with interchangeable water tank (Mann's—steam).

(4) One permanent wagon, fitted with solid rubber tyres. Water tank fitted inside body during season (Foden—steam).

All four "guaranteed as to terms of load and speed."

(1) Purchased in 1907, and not altogether successful.

(2) Purchased in 1911, capital cost £602. Quite a practical machine as a roller, and having the advantage of not needing a watering can in attendance, as is usual with a roller.

(3) Purchased in 1913; capital cost £566.

"We have not adopted motor-driven street-sweeping machines. For collecting house refuse it has never been considered that this form of haulage is satisfactory, owing to the constant starting and stopping. For removing large quantities of refuse from barracks, &c., where the van can be loaded up and run direct to the destructor, it is quite satisfactory. With, however, the present shortage of horses and carters, I think it very possible that motor traction will be found to be, after all, a satisfactory means of removing house refuse, even allowing for the drawbacks mentioned. The council has included in this year's estimate a sum for purchasing two other trolleys to be used in this class of work.

"The water-van does the work of at least three horse-drawn vans; it has the added advantage of possessing a larger radius of distribution. We estimate the average annual cost of repairs and renewals as 5 per cent on the initial cost. Drivers are paid 35s. per week, and each is accompanied by an assistant at 15s."

(4) Motor tipping wagon with interchangeable 1,000-gallon water tank, cost £580; but, in order to minimise the noise, it has been fitted with rubber tyres at an extra cost of £85. It is hoped that the rubber tyres will reduce the expense of upkeep, as the machinery should not be so much shaken.

Richmond.—Three steam wagons. Tare weight of container—two, 4 tons 19 cwt.; one, 3 tons. Capacity of water vans—two tanks, 900 gallons; one, 600 gallons. Cost—two, £600 each; one, £575, including interchangeable tank. Artillery tyre wheels with steel tyres; one plain, two with strakes. Total cost per day 18s., exclusive of repayment of loan and interest.

Rochdale.—One 3½-ton (melt) wagon (Clayton & Co.—petrol.)

"It cost £700, and was put to work in an added area, instead of adding four horses, stables and vehicles. It has done well, and been in use five years, and we are now considering the matter of a further mechanical vehicle. It has been used in the collection of ashes, &c., in connection with this department."

Rochester.—"We use steam tractors here for a particular purpose—viz., the haulage of vacuum sanitary tanks for the removal of the liquid contents of cesspools, but we do not use motor vehicles for general purposes.

"I am sorry I can give you no particulars of the cost as compared with horse tractors. My staff is not sufficient to admit of my keeping the details necessary to make a fair comparison, but you may take it that the advantage is in favour of the steam tractor."

St. Marylebone.—Last year this borough council purchased two Laffly petrol motor sweeping-machines (F. C. Archer). Cost, about £650 each. Third similar motor sweeper on order from same firm. No detailed statistics available as to the cost per mile. Machines have carried out their work (chiefly night cleansing) satisfactorily and efficiently.

Sheffield.—A report issued by the responsible officer to this corporation shows that cost per ton of collection of refuse by day by a 2-ton electric vehicle over a twenty-two weeks' test was 5s. 0·8d. Horse

work on same district for one month cost per ton 7s. 0·4d.

Night work for twenty-one weeks' test by electric vehicle cost per ton 2s. 3·4d. For three months' test by horse work, cost per ton 3s. 3·2d.

A test of a second 2-ton electric vehicle worked by day on refuse collecting over a period of six weeks came out at 4s. 0·1d. per ton. Horse labour collecting in the same district over a one-month period worked out at 3s. 8·6d. Night work for a six weeks' test by the electric vehicle cost 1s. 10·3d. per ton, while collecting by horse labour for a one-month test on night work cost 2s. 6·2d. per ton.

The report states that horse labour holds an advantage where the total mileage per journey does not exceed three, but over this distance the electric vehicles show a decided superiority. With electric only used on day work position differs somewhat, as the vehicle costs cannot be divided over two shifts. With night and day shifts by same machines it is a pronounced success.

Six 5-ton lorries, which were taken over by the War Office in August, 1914, the cost of which was £4,350

The average running cost per mile was 8·82d. Average cost per mile, including depreciation, was 1s. 0·05d. Average cost per ton per mile was 5·55d.

Estimated saving over horses during the whole period of working is £3,003.

The motors were installed as follows: December 15, 1910; May 14, 1912; July 31, 1913 (two); June 10, 1914 (two).

Also two electric tipping wagons, 6 cub. yds. capacity, 2-ton load. Cost £1,000. Made by Edison Accumulators, Limited. Rubber tyres. Electricity cost 1¼d. per mile, negligible.

Southend.—1,000-gallon steam vehicle for street watering. Total cost per day, £1 9s. 1d.; twelve loads per day, 12,000 gallons; average mileage, 26. Cost per mile, 13s. 6d.

Six hundred and thirty-gallon petrol vehicle. Total cost per day, £1 18s. 1d.; fourteen loads per day, 8,400 gallons; average mileage, 38. Cost per mile, 1s.

Note.—The time taken for filling the van in this town is more than it should be.

South Shields.—2-ton tipping wagon. (Edison—electric.)

"We have had the van in use for about three months, which is, however, rather a short time to give detailed figures, although the statistics for the same are being taken out. This van cost practically £1,000, and has a normal capacity of 2 tons, but it can carry more, and is used mainly for the collection of privy ashpit refuse, for which, having regard to the ease of starting and stopping and silent running, it is eminently suitable. The van is at work from 11 a.m. to 5 p.m., being charged up between 5 p.m. and 11 p.m., and while engaged on this work is equal to three horses on night and three horses on day shift. The current consumed out of battery works out at about 2 ampère-hours per ton-mile."

Southwark.—Steam motor wagon on order from Yorkshire Commercial Motor Company. Cost £640. Being specially built as a dust van with low sides and mechanical tipping gear; carrying capacity of 3 tons.

Stockport.—Steam motor wagon used by gas department for conveying coal and coke. Yorkshire Motor Company's manufacture. Capacity 6 tons, on wagon body. No running costs given owing to the short journeys performed by the motor.

Surrey County Council.—"For my purpose, which requires long journeys, 5-ton petrol motors are the most convenient. The cost works out at about 4d. per ton-mile of material carried, including costs and 20 per cent depreciation on the vehicles."

Tunbridge Wells Town Council.—Two 30-h.p. (6 cub. yds.) tractors, with detachable trailer wagons (two each) for haulage of stone, pipe and other materials. Tractors convertible to light road rollers if required. (Aveling & Porter—steam.)

"Cost of tractor, purchased two years ago, was £550. Each of the tractors easily does the work of five horses—horse contractors in this town are now asking 12s. to 13s. per day per horse, cart, and man. I have not kept any separate detailed account of running these tractors for haulage purposes as they are convertible into light rollers when required."

Walthamstow Urban District Council.—Two 25-h.p. (5-ton) interchangeable wagons (tipping) and street-watering machines. (One Mann's, one Clayton—steam.)

One 20-h.p. (4-ton) tipping-box, convertible to road roller (6 ton), and street-watering machine. (Mann's—steam.)

One 15-h.p. (3-ton) tipping wagon (not convertible). (Mann's—steam.)

Wagons used for carriage of small quantities of materials for repair jobs.

"I am very well satisfied with the results of my experience. As regards street cleansing, refuse and slop collection, and the carriage of water for road making, I am not at the moment satisfied that motor vehicles can be economically employed on either of these works.

"I have had a Lafflly in use for some time, and am exceedingly pleased with it."

Warminster Urban District Council.—One 6-ton wagon. (Alley & Maclellan—steam.)

"As conditions are not normal, owing to large military camp in the district, the comparison between the cost of mechanical and horse haulage would not be of much value. Without the steam wagon I could not possibly have carried out the repairs to the roads, as there is a scarcity of horses and the rate for hire very

high—practically double pre-war prices. Our wagon is an old "Sentinel" purchased for about £200. It has been running twelve months, and has given great satisfaction. There is no doubt about the advantage of these vehicles over horses, and when times become normal I shall recommend my council to purchase an up-to-date motor vehicle with interchangeable bodies."

Bucks County District Council. One 10-ton (3-ton) wagon (interchangeable with water tank (600 gallons capacity). Used for road rolling, hauling, and street watering purposes. (Mann's steam.)

"The actual cost is 1s. 6d. per day, and it does the work of four horses."

RUNNING COSTS.

You will notice there is considerable variation in the running costs as recorded in the foregoing statements, and I append here, for your better information, a short summary of the statements:—

The differences in figures may be caused by many reasons. Running costs, for instance, is a term which may be answered in a variety of ways. Then there are the load factors (over-loading and under-loading) local and traffic conditions, wear and tear and repair items, amount of time in which the machines are standing idle or working, &c.

In order that you may have all available up-to-date information at your disposal I quote other figures which have been compiled by an expert on mechanical traction, after full consideration being given to all makes of vehicles and varied conditions.

The table, therefore, may be taken as a very fair guide in regard to running costs, and considered with the statements of other municipal authorities, and their explanatory notes and the manufacturers' estimates, a reasonable conclusion can be arrived at.

I may here note that no standard statistics to my knowledge have been compiled and published with reference to electric or petrol-electric vehicles; therefore those issued by the manufacturer must suffice in the latter case, while in the former case I have taken your council's electricity department's working cost for purpose of my comparative estimates.

Estimate of Running Costs for Petrol and Steam Vehicles of Three Tons Nett Load.

Petrol motor. Life of vehicle taken as 50,000 miles. Basis cost £740, exclusive of body. Average mileage per day, 40.

	s.	d.
Interest on capital 5 per cent.	2	0
Depreciation	3	10
Insurance	1	0
Garaging	0	6
Tyres	8	8
Driver's wages	6	0
Oil	0	8
Petrol (7 miles per gallon at 1s. 6d.)	8	6
Repairs	2	0
Per day	33	2

or 9·9d. per mile.

Steam vehicle. Life of vehicle taken as 50,000 miles. Basis cost £575, exclusive of body. Average mileage per day, 40.

	s.	d.
Interest on capital 5 per cent.	1	6
Depreciation	2	10
Insurance	1	0
Garaging ...	0	6
Tyres	10	0
Driver's wages	6	0
Stoker	4	0
Oil	1	1
Coal (15 miles per cwt. at 1s. 3d.)	4	0
Repairs	3	0
Per day ...	33	11

or 10·06d. per mile.

Electric vehicle. Cost of vehicle, £1,240. Cost for week ending May 24, 1916.

	£	s.	d.
Wages	4	0	0
Current	0	14	0
Sundries	0	2	0
Tyres	0	8	0
Capital charges and insurance	3	1	0
Per week of 5 days	£8	5	0

27s. 6d. per day = 9·3d. per ton per 1½ miles.

The electrical engineer informs me that the "all-in" cost of the electrical vehicle under his control works out at about 9·56d. per ton. The journey being about ¾ mile each way, the cost per ton-mile therefore becomes about 6·13d. per ton-mile.

Petrol-electric Vehicles. I have no details to submit as in the case of steam or petrol vehicles, but have an "all-in" mileage rate of 9·25d. and a daily cost of 30s. 10d.

Having given you all the information obtained from other municipalities as to their experience, I will now deal with the financial side as it will affect this council, and give my opinion as to the comparative working costs of horse labour and mechanical traction.

For the purpose of my calculations I have taken as my bases for petrol and steam and electric vehicles the figures as shown in detail.

For the petrol-electric vehicle I have taken the running cost as above as given by T. Tilling, Limited, who work motor lorries, mail vans, &c., with this type of vehicle.

For calculations of horse labour I have taken the figures of the accepted tenderer for the current year's contracts.

The contract prices for this year are higher than they have previously ever been to my knowledge, and it is hoped prices for horse labour will decline considerably when the present hostilities are ended. Against this the prices of fuel, oil and tyres of motor vehicles will also decrease, so that the ruling prices of the present time can be taken as fair comparisons.

Haulage Work. Day-work Prices.

Journeys between 1 and 2 miles, one way.

Horse labour, 12s. Average five journeys, with a load of about 30 cwt. each journey. Total material, 7½ tons.

Petrol, steam, electric or petrol-electric vehicles can all average ten journeys with a load of about 3 tons each journey. Total material hauled 30 tons.

At daily costs of petrol ...	33'2		
steam ...	33'11		
electric ...	33'0	6'1	per ton mile.
petrol-electric	30'10	(40 tons).	

Result, day work rate:—

	s.	d.	
Horse labour ...	1	7·2	per ton.
Petrol vehicle ...	1	1·2	,,
Steam vehicle	1	1·5	,,
Electric vehicle ...	1	0·2	,,
Petrol-electric		9·2	,,

Piece-work.

Journeys average 2 miles cartage.

Horse labour, 1s. 4d. per ton.

Result, piece-work rate:—

	s.	d.		d.	
Horse labour ...	1	4·5	per ton, or	8·2	per ton mile.
Petrol vehicle ...	1	1·2	,,	6·6	,,
Steam vehicle ...	1	1·5	,,	6·7	,,
Electric vehicle	1	0·2	,,	6·1	,,
Petrol-electric		9·2	,,	1·6	,,

NOTE. I might mention that in a paper which was read lately by a responsible official of the Sheffield Corporation the statement was made that "an advantage of motor transport, as compared with horse haulage, was that the motors would serve a radius of 30 or 40 miles per day, as compared with 12 miles for horse haulage."

It is also necessary to mention that in calculating rates of the motor vehicles I have allowed the same cost for 2-mile journey as 1½ miles or 1¼ miles, and for a 3-tons load, whereas some of the 3-ton vehicles carry between 3 and 3 tons 17 cwt.

In order to explain more fully the meaning of the first part of this statement, it seems advisable to point out that when on piece work, as soon as a horse-vehicle has gone over 1 mile, the 2-mile rate is paid.

The same rate per mile has also been allowed for returning empty, to fill up, as when full, also the extra distance rate.

You will therefore see that, although a saving will be made of practically 3d. to 3½d. per ton in the cost of petrol or steam vehicles, and 4½d. per ton by an electric vehicle, and 7½d. per ton by petrol-electric vehicle, it would rarely work out in practice at more than this.

(To be concluded.)

Institution of Municipal and County Engineers.

SOUTHERN DISTRICT MEETING AT BRISTOL.

A successful and highly interesting meeting of the Southern District of the Institution of Municipal and County Engineers was held at Bristol on Saturday last. Mr. J. S. Pickering (Cheltenham) the district chairman, presided, and there were present the Lord Mayor of Bristol (Dr. Barclay Baron), the Sheriff of Bristol (Mr. H. E. Chattock), Messrs. Charles T. Enwright (Bristol), J. G. Powell (Wilts County), R. B. Lees (Bradford-on-Avon), R. C. Stephens (Bristol), C. H. Sunderland (Midsomer Norton), W. J. Goodwin (Salisbury), T. Caink (Worcester), J. Parker (Hereford), E. W. A. Carter (Gloucester), N. F. Spence (Marlborough), H. J. Farmer (Christchurch), W. H. G. Keiser (Bristol), F. Dolamore (Bournemouth), H. C. Phillips (Mere), E. S. Perrott (Bristol), J. C. Hunt (Bristol), H. H. Howell (Bristol), F. H. Smith (Portishead), A. H. Claypole (Bristol), H. W. Harding (Bristol), F. J. Williams (Bristol), F. R. Phipps (Basingstoke), L. S. McKenzie (Bristol), T. H. Yabbicom (Bristol), G. Stephens (Bristol), and H. Howard Humphreys (Westminster).

The members were received at the Council House by the Lord Mayor, who said it gave him great pleasure to welcome them. After referring to previous visits of the institution to Bristol, his lordship went on to comment on the fact that out of a total membership of some 1,800, over 200 members were engaged in war work. That was very satisfactory, and showed their patriotism, but at the same time must have meant a considerable amount of embarrassment in their work. But one was naturally delighted to know that men from every direction had come forward to fight for the Empire. The Southern District, he understood, was a wide and important area, stretching as far as the Isle of Wight, and included ninety-five members. It gave him pleasure to be present with them that day—for two reasons. One was that it enabled him to welcome their very much esteemed friend Mr. Yabbicom, their former city engineer; the other was that he was able to say publicly—what every member of the corporation would cordially endorse—how very highly they appreciated the services of the present city engineer, Mr. McKenzie. He desired at the same time to bear testimony to the important work that was being done by their institution. As a member of the medical profession, he knew that preventive medicine was often more important than curative medicine, and the whole business of their life consisted of preventing disease by providing for the cleanliness of streets, efficient sewerage arrangements, attention to water supply, and various other things. They were all working in the same direction and were largely responsible for the prevention of disease, and therefore it was very difficult to overestimate the value of the work done by a large number of trained specialists in sanitary engineering, such as they were.

Mr. Yabbicom said the first time he had the pleasure of meeting the institution at Bristol was in 1878. At that time his respected predecessor, Mr. Ashmead, occupied the position of president, and it was stated with much pride in the annual report that the roll of the association was nearly 200. They had grown since then, and to something like maturity. The next time the institution visited Bristol was in 1896. At that time Mr. Ashmead had retired from his more active duties, and he (the speaker) filled the position of city engineer. That year, Mr. May, of Brighton, was their president. The third occasion was the annual meeting in 1902, when the institution did him the honour of making him their president. It was a successful meeting, and many papers were brought forward, and, what was more remarkable, they were all discussed. This was the fourth visit, and he was glad to see that the membership was now 1,800. Their members were scattered all over the world. Of course, the greater number were in the British Isles, but they had twenty in India, thirty-five in the South African district, and in various other parts fifty-one. Of their members on active service he was sorry to say many had been wounded, and there were some whose names would be inscribed on the roll of honour in the future.

The Sheriff of Bristol said that as an engineer he would also like to say a few words. He had long since given up practice, but he still took great interest in engineering matters, and was proud to think that since the war commenced a great part of the victories was due to the work of the engineers.

Mr. Pickering, in returning thanks, observed that the visit which the institution paid to Bristol thirty-nine years ago formed an interesting record in their proceedings, particularly on account of what might be termed an historical discussion on the vexed question of the ventilation of sewers—a problem which even now had not been properly solved. The institution's volume of proceedings contained, he thought, particulars of most of the municipal undertakings of Bristol, but many of the members had not had an opportunity of seeing these works, and he felt sure from the excellent programme that had been arranged that day that their visit would prove both interesting and profitable. It seemed specially fitting at a time like the present that they should meet together to see if they could not effect an improvement in their methods of working under the special circumstances that prevailed. Those of them beyond the fighting age who were left behind to attend to their various duties under the public authorities they served felt it was most beneficial to attend meetings of that description to gather information which might be of the utmost value to the communities they represented. Now that economy had to be practised in a far more drastic manner than was ever dreamt of, it was very necessary that as municipal engineers they should lose no opportunity of making such improvements in their practice as would result in more economical methods. Manufacturers, too, would require to take steps to reduce the cost of the articles which they produced.

DISTRICT COMMITTEE.

Following upon the confirmation of the minutes of the previous meeting—held at Salisbury on May 16, 1914—the Executive Committee for the district was re-elected as follows: Messrs. S. Stallard (Oxford), J. S. Pickering (Cheltenham), W. J. Goodwin (Salisbury), S. J. L. Vincent (Newbury), J. A. Crowther (Southampton), L. A. Cozens (Isle of Wight), J. W. Webster (Cowes), T. J. Guilbert (Guernsey), and J. H. Blizard (Southampton).

On the motion of the chairman a vote of thanks was accorded to Mr. R. Read (Gloucester) for his past services as chairman of the district.

SURVEYORS AND PETROL.

A member put a question as to whether the institution had taken up the question of the supply of petrol for engineers' and surveyors' motor-cars.

The Chairman answered in the affirmative. The council had done what they could, but the Government did not seem to think surveyors should have special treatment in the matter. It had been pointed out to the Petrol Control Committee that the work of the municipal engineer was quite as important as that of the doctor, who got his supply of petrol without difficulty. It was now for individual members to worry the Control Committee, and the more complaints the better.

A speaker expressed the opinion that, in view of the importance of the matter it should be taken up at the first meeting of the council and another application made.

PAPERS AND DISCUSSIONS.

Papers dealing with the Clifton Suspension Bridge, the Eastville refuse destructor—an illustrated description of which appeared in last week's Surveyor—Barton Hill Baths, and six sections of bituminous roads laid during the past four years in and around Bristol, were submitted by Messrs. L. S. McKenzie, Assoc.M.Inst.C.E., the city engineer; A. H. Claypole, Assoc.M.Inst.C.E., and H. W. Harding. Extracts from these contributions are given elsewhere in this issue.

CLIFTON SUSPENSION BRIDGE.

Mr. Howard Humphreys, consulting engineer to the Bridge Company, said that he agreed with the whole of Mr. McKenzie's paper with the exception of a little bit of the chronology. The first stone was laid by the Marquess of Northampton in 1836, on the occasion of the visit of the British Association. In 1843 the whole of the funds had been expended, and still much remained to be done. In 1853 the work was closed down. In 1859 Mr. Brunel died, but he had spared no effort in the meantime to get the

bridge completed. Mr. Baumel always looked upon the bridge with great interest, because it was the starting-point of his career. He suggested that Bristol should erect some kind of memorial to him, seeing how closely he was identified with the city, and how much Bristol owed to him.

Asked as to whether the substitution of Limmer asphalt for the floor of the bridge roadway in place of Memel timber had proved satisfactory, Mr. Humphries said it had been as satisfactory as one could expect in view of the severe undulations and disturbance that was constantly going on. The company had found it about the best kind of flooring procurable. The ideal material would be vulcanised rubber, but the cost of that, of course, would have been colossal.

EASTVILLE REFUSE DESTRUCTOR.

On the presentation of Mr. Claypole's paper, Mr. F. DOLAMORE asked whether the fires were banked up during the periods the destructor was shut down, and whether when the fires were allowed to go so low it was not destructive to the furnace lining.

Mr. CLAYPOLE said the fires were banked up while the destructor was shut down. It was not, of course, good for the furnace lining, but it seemed to have done very little harm, and as the tips filled up they would be able to keep the destructor going throughout the whole twenty-four hours.

Mr. J. PARKER inquired whether there was more than one destructor. In Hereford they had one which had been in operation for more than nineteen years, but it consumed only a little more than half the refuse he had to deal with. The rest caused a nuisance wherever they tipped it, and they were now face to face with a second installation, in connection with which it was intended to utilise the heat for the swimming baths. The scheme, however, had been shelved for the present. It seemed to him that in a place like Bristol there ought to be more than one destructor. During the time his own destructor had been at work he had not used a hatful of coal, and it had paid for itself three years after coming into operation. They had not changed the fire bars once during the whole of the nineteen years, and it was remarkable how small the cost of upkeep had been in other respects. He was a believer in destructors, and but for the war Hereford would have been in possession of another installation by now.

The CHAIRMAN asked whether trade refuse was removed by the corporation free of charge. The site of the destructor was a difficult one, and he should like to know what was the average depth to which the piles were driven through the 30-ft. bed of clay. Jarrah wood, he noticed, had been used for the approach road, but having regard to the corrugations which took place in that kind of wood, that did not appear to him to be the most suitable material to adopt in a position where horses were continually turning in and out. Were the destructor units worked alternately or together? He gathered from the paper they were worked together, but if that were so he would like to know when the flues were cleaned out. He was particularly interested in the use to which the clinker was put, and he was glad to see some trials in bituminous road construction were going to be made with it. There was a great future in that, because it would be one of their duties now to find means of making such roads at a greatly reduced cost; and where the traffic was not great he thought the bituminous clinker road would prove satisfactory. What was the electrical energy used for? The paper merely said the destructor power was used for generating electric energy, and possibly it might only be employed for lighting the works, running the crushing machine, and so on. That was an interesting point, for with something like 110 tons of refuse being burnt daily, and with coal at £1 per ton, the steam produced must be worth £2,000 or £3,000 per annum. As regarded the sorting out of paper from the refuse, his view was that it would be far better if that were collected separately from the houses. Mr Pickering added that he would like to have the cost of burning.

Mr. CLAYPOLE, replying, said there was another destructor. The approximate total quantity of refuse collected per annum was about 95,000 tons, and previous to the erection of the destructor about 60,000 was tipped. As regarded fire bars, the destructor had not, of course, had a great life yet, and they only started full firing in November, 1914. A charge was made for the removal of trade refuse. The construction of the ferro-concrete raft was naturally the most important feature of the undertaking. The site was an excellent one as regarded position, but a bad one as regarded foundations. The piles were driven down to the marl. As to the question of corrugation, there were no corrugations at present. The units were worked together. The flues were cleaned out on Monday mornings, the men coming a little earlier than usual to do the work. The flue dust was sold for the manufacture of disinfecting powder.

The CHAIRMAN: Does the cleaning take only one morning?

Mr. CLAYPOLE: Yes; from 5 to 10 o'clock. The combustion chamber was cleaned out less frequently. The electric energy was used at present just for driving the mortar mill and the clinker crusher, lighting up the place, driving the fan for forced draught, and pumping water from the river for purification and softening purposes. There was, of course, a great deal of steam going to waste. A large quantity of the clinker had been used for camp roads, but during the first year both the clinker and ash were tipped on the site to fill up holes. As to the sorting of paper, a certain amount was always to be found in the refuse, apart from that collected separately. The boy engaged on the sorting more than paid his wages. Owing to the war they were naturally working under exceptional conditions, but the cost of destruction came out at about 2s. per ton.

BARTON HILL BATHS.

A few questions were put to the author of the baths paper, Mr. Harding, who in the course of his reply stated that they had no means of regulating the supply of hot water to the spray or needle baths, but any excessive use would be pointed out by the attendant. There had been no complaints as to the Terrazzo paving being slippery, but in their new baths they had adopted Ruabon ribbed tiles. The plant was capable of maintaining the water in the baths at a temperature of 75 deg. under normal conditions; but in the past twelve months they had reduced the figure, and they had, he believed, got down as low as 68 deg. As to whether the water was cleansed after heating before being returned to the bath, a filter was provided, but there was no system of water softening.

In the course of the afternoon an inspection was made of the works described in the several papers.

Maidstone's Municipal Farming.—Maidstone Corporation has been experimenting in municipal farming, and a potato patch of a little under 4 acres at the sewage disposal works has shown a profit of £160.

Water Disinfection.*

By R. B. MORSE, Chief Engineer, and H. R. HALL, Assistant Chief Engineer, Maryland State Department of Health.

There are eighty-three public water supplies in Maryland, serving about 842,500 people 62·1 per cent. of the estimated total population of 1,357,374

Broad as is the control of the State over the design and construction of water supplies, it is no more liberal than is its authority over the operation of existing systems, in so far as the public health is affected. If the State Board of Health finds that any water plant is not properly operated, it may require a change of method, and may, when necessary, force the employment of competent attendants, if even being enabled to attain this end by appointing attendants of its own selection at the cost of the municipality or water company owning the plant. Possible arbitrary action, however, is precluded by a provision in the law allowing appeal to the local county court, before which the board would have to prove the reasonableness of its act.

The State's investigations commenced to show that many of the water systems were badly in need of attention. The surface supplies were derived from streams fed by watersheds containing habitations, in many cases providing numerous sources of contamination, and, in general, protection was not offered by long storage, filtration, or other treatment. Water was usually taken from the stream at an intake dam, and passed into a distributing reservoir of insufficient capacity to provide a safe period of storage. Moreover, water from some of the tubular well systems was found to be polluted, because the wells either were of too shallow depth and located in the midst of thickly-settled districts, where sources of pollution were numerous, or were driven in rock containing fissures. Some supplies previously considered to be beyond suspicion were found upon close investigation to be in a bad condition, and a menace to the public health.

In a large number of the instances where supplies were polluted the water was satisfactory from a physical standpoint, there being an absence of colour, turbidity, and other objectionable characteristics. This was naturally true in the case of most well and spring waters. The water from streams fed by mountain watersheds, and from watersheds containing much wooded or uncultivated land, was also generally in good physical condition.

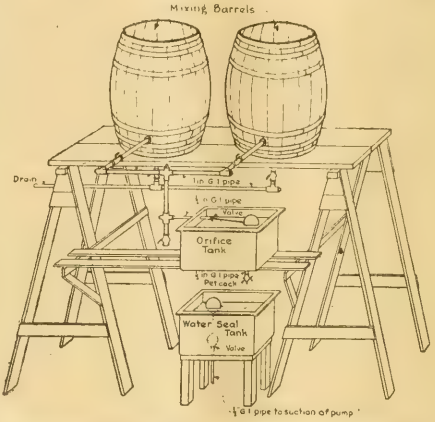
Where water, otherwise acceptable, was found to be in an unsafe sanitary condition, filtration did not appear to be necessary or even advisable for assuring the proper degree of purity. Expense and the improbability of proper operation are two factors which would make filtration plants undesirable for many of the small systems which abound in Maryland. Consequently, disinfection was resorted to wherever it would serve the purpose. There were, however, a considerable number of surface supplies derived from streams flowing through cultivated country and furnishing a water occasionally or persistently turbid. Such supplies as these naturally require filtration. Disinfection in connection with filtration is general, and is required in all new installations. While the writers' assistants have been able to obtain good results from several filter plants without the addition of disinfectants, the character of attention which small works ordinarily receive makes their use essential.

METHODS.

Disinfection by means of hypochlorite of calcium or liquid chlorine is naturally the most common method practised, although one small mill town uses distilled water, which is the condensed exhaust from the steam turbines in the mill, and there is an ozone plant which is operated in conjunction with one of the hypochlorite installations. There is a possibility that ultra-violet ray disinfection will shortly be introduced, as its use is under consideration for a mechanical filter plant now being constructed

The type of apparatus suitable for hypochlorite or liquid chlorine treatment in any particular case depends upon the method by which water is supplied. Where the flow of water to be treated is at most times substantially uniform, as in the case of certain pumping plants, or in gravity lines discharging into reservoirs, a manually-controlled apparatus is sufficient. Where fluctuations occur in the rate of flow, automatic control devices are essential for proper results. Liquid chlorine plants, so-called, introduce chlorine into the water, either as a gas or in solution. The gas feed, usually called "direct feed," is well adapted for use where no water under pressure, for dissolving the gas, can be easily obtained.

The amount of chemical used at the disinfecting plants in Maryland has varied widely according to local conditions. It has ranged from 0·2 to 3·0 parts per 1,000,000 of available chlorine in the case of hypochlorite treatment, and from 0·25 to 0·67 parts where liquid chlorine is used. Where the disinfectant is applied to a spring or well water, or to the effluent from a well-operated filtration plant, the amount required is usually near the minimum mentioned above. In the case of turbid waters, larger amounts have been found necessary for proper treatment, and



Emergency Hypochlorite Plant for Disinfecting Water Supplies.

List of Material.

Two clean watertight barrels.
Several feet of 1-in. and ½-in. galvanised iron pipe and tools for cutting and threading.
Five 1-in. valves.
Four 1-in. "T" branches.
One 1-in. by ½ in. cross or 4-way fitting.
Four locknuts to attach 1-in. pipe to barrels.
One 1-in. cross or 4-way fitting.
Four 1-in. pipe plugs.
One ½-in. pipe plug.
One ½-in. pet cock.
One watertight tank, preferably lead lined, with valve, and float control which opens valve as water level drops. An apparatus of this type easily obtained is a flush tank for a toilet.
One lead-lined watertight tank with valve, and float control which closes valve as water level drops. This is necessary only where disinfectant is introduced into suction of pump.

at times of extreme turbidity excessive quantities are required. In the treatment of the Baltimore City water, as high as 3 parts per 1,000,000 of available chlorine, or 75 lb. of hypochlorite to the 1,000,000 gallons, have been used on raw water.

The amount necessary in many instances depends also upon the character of attention given the apparatus.

RESULTS OF DISINFECTION.

It is by no means a fact that the disinfecting plants in Maryland have been operated with complete satisfaction, for most of them have had trouble of some kind. The difficulties encountered could generally have been avoided with more attention to proper operation. With hypochlorite plants the principal annoyance has been due to the formation of coatings, which clog the pipes; and, where the solution was particularly strong, the materials of which the piping was made have been attacked, necessitating the replacement of parts. These are not serious troubles, however, and can be eliminated by frequent inspection. In the case of liquid chlorine plants it has been found

* From a paper read before the New England Waterworks Association.

that occasionally a part becomes corroded and requires replacement, or a valve gets out of adjustment, but the gradual perfection of apparatus is making such occurrences less frequent.

Where faithful and intelligent attention has been given to operation, and the amount of disinfectant used has not been excessive, few complaints have been made regarding tastes or odours in the water. In one instance, where a liquid chlorine plant of the manual control type was disinfecting water, the flow of which fluctuated considerably, there was always an overdose at night, which caused complaint due to tastes noticeable during the early hours of the day. This, of course, was the fault of the method employed, and not of the treatment itself. In general, fewer complaints have been registered regarding disagreeable tastes where liquid chlorine was used than in the case of hypochlorite.

DECREASE OF TYPHOID.

There has been a marked decrease in the prevalence of typhoid fever in some of the communities where disinfecting plants have been installed. In most cases, however, the period of operation has been so short, and, on account of the small size of some of the places, the appearance of typhoid so irregular, that records do not clearly indicate the effect produced.

EMERGENCY DOSING APPARATUS.

In order that prompt remedial measures may be instituted when a water supply is at any time found to be in an unsafe condition, or when an outbreak of typhoid fever casts suspicion on a water previously untreated, the engineers of the State Board of Health are all instructed in the setting up of an emergency hypochlorite dosing apparatus, making use of ordinary and easily obtainable materials. A sketch showing the general arrangement of the device used, including a bill of material, has been prepared, and is usually sent ahead, so that the necessary material may be ready when the engineer arrives at his destination. This apparatus, shown herewith, has proven its value on many occasions, and several of the installations are still in operation.

Basing judgment on experience in Maryland, it may be stated that, where chlorinating plants for water supplies are given faithful and intelligent attention, their use is decidedly a success, and they provide an effective and inexpensive method for treating many water supplies which do not need filtration, as well as for safeguarding those supplies for which filtration, although desirable, is prohibitive. Unfortunately, there seems to have been some tendency among manufacturers to convey the impression that little attention need be paid to the operation of a liquid chlorine plant. This has given the operator the impression, in some instances, that the apparatus can be entirely neglected. While it is true that little or no difficulty need be experienced, except when parts give out, neglect is certain to cause irregularity in dosing, exposure in certain cases to freezing and other undesirable results. Greater efficiency from some of the disinfecting plants in Maryland is to be expected in the future, as the State Board of Health will be enabled to make more frequent inspections than in the past. This will be made possible by the fact that, in addition to the main office of the engineering division, there are maintained four offices in various parts of the State, at each of which there is a resident engineer who has direct supervision over sanitary engineering matters in his district. Without an effective system of control, disinfection would fall short of giving entire satisfaction in connection with many small water supplies.

Town Planning in East Birmingham.—The Birmingham Town Council have received the sanction of the Local Government Board to the preparation of an amending scheme of town planning for East Birmingham.

Proposed Blackpool Improvement.—A special highway sub-committee recommend the Blackpool Town Council to promote a Bill in Parliament to embrace amalgamation with Bispham, the extension of the promenade at South Shore at a cost of about £60,000, and the erection of two open-air swimming baths on the foreshore at a cost of about £16,000 each. The borough surveyor, Mr. J. S. Brodie, has prepared plans of the proposed swimming baths, each of which is to measure 400 ft. by 200 ft.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Is it not to be hoped that the statement of the engineers to the Road Board, appearing as an appendix to the recently-issued annual report of that board, with regard to the behaviour of certain materials in the road-testing machine, will be amplified in any further reports that may be made hereafter, with some definite conclusions as to what to introduce and what to avoid in the composition of these artificial "asphaltic" carpets? Would not some definite pronouncement by those who have the advantage of making these tests be of incalculable value to those road engineers who are not so favourably informed?

* * * *

Is it not rather interesting to note that the cost of rolling the roads in the Belper Rural District, as given in the issue of THE SURVEYOR of the 25th ult., comes out at 13·11d. per ton of metal consolidated, whereas the cost of this work in Buckinghamshire, several years ago, was 14·24d. per ton, although in the latter case the steam rollers were hired? If depreciation of the rollers had been included in the case of Belper, would not the cost have practically worked out at almost exactly the same as in Buckinghamshire?

* * * *

Are the Municipality of Johannesburg well advised in their proposal to underdrain 12 acres of land at their sewage farm at Klipspruit with 4-in. pipes, laid 3 ft. deep and 50 ft. apart, in order to improve the effluent from their farm, as stated in *South African Engineering* of August last? Is it not now well known that land which is incapable of filtering sewage cannot be improved by subdrainage, as the drains pass the effluent direct to the outfall, and that land that is capable of filtering is in no way improved by subdrainage, except by a very few intercepting drains? Should not this municipality stay their hands and reconsider the proposal?

* * * *

Is it a fact, as recently stated in a building contemporary, that, if the finished surface of cast-iron is marked in any way with white chalk it will rust the iron in such a manner that it will persist for years after all traces of this marking have been apparently wiped off? As all chalk has been formed under the sea, is there any connection between this remarkable action of chalk on cast-iron and the action of sea-water on iron, which is now engaging the attention of scientists?

* * * *

Was it not an excellent idea of Lieutenant R. D. T. Jones, Royal Engineers, to ask engineers to send him all their old cloth tracings and unused tracing cloth, in order that these might be boiled, washed, and sterilised, and converted into bandages, pillow-cases, &c., for soldiers' hospitals? Would not all surveyors and engineers be doing a kind and useful work by sending him this old tracing cloth, addressed to him at the Ministry of Munitions Explosives Department, Storeys Gate, Westminster, S.W.? Is there not an existing tradition that underpaid draughtsmen in the "old days" used to annex all the tracing cloth they could in order similarly to treat it and make shirts for themselves and their families?

* * * *

Is not the ubiquitous surveyor a jack of trades and master of all? Is not the surveyor of Bognor to be congratulated on the success which recently attended a "demonstration" in aid of the Royal West Sussex Hospital, and which the local press attributed to Mr. Bridges' ability, ingenuity and energy, and mentioned that nearly all the tableaux were the outcome of his skill and design?

Municipal Employees Exempted.—At the Kingston, Surrey, Tribunal conditional exemption was, on the application of the borough surveyor, Mr. R. H. Clucas, granted to three men engaged in various capacities at the corporation sewage works.—The temporary sanitary inspector and surveyor to the Maldens and Coombe Urban District Council, aged thirty-eight, was on Saturday granted further exemption to November 30th, on the grounds of domestic and financial hardship.—Appellant, who had been passed for home service, has five children, of whom one is serving in the Army in France.

Association of Managers of Sewage Disposal Works.

VISIT TO SUTTON, SURREY.

A meeting of the Metropolitan District of the above association was held on Saturday last at Sutton, Surrey. The attendance included Mr. W. Hedley Grieves (surveyor to the Sutton Urban District Council), Mr. F. G. Barstow (assistant surveyor), Mr. Joseph Taylor (manager of sewage works), Mr. J. B. Croll (Richmond, Surrey), Mr. T. Hughes (Hampton), Mr. E. D. Holgate (Grays), Mr. J. H. Barford (Maidenhead), Mr. A. Eade (St. Albans), Mr. E. Lindon (Wanstead), Mr. H. Duckworth (Hertford), Mr. W. Turner (Wembley), Mr. S. Duxbury (Maldens), Mr. J. Craig (Romford), Mr. J. Bibby (Biggleswade), Mr. T. Flucker (Romford), Mr. Reginald Brown, M.INST.C.E. (Southall-Norwood), Mr. A. Scott Murray (West Kent Main Sewerage Board), Mr. E. J. Silcock, M.INST.C.E. (Westminster), Mr. J. Blizard, ASSOC.M.INST.C.E. (Southampton), Mr. J. E. Webb and Mr. A. E. Hammond (Hendon), Mr. W. G. Rich, Mr. W. H. Rogers, and Mr. H. Dyson (Haslemere), Mr. J. Brown (Ealing), Mr. W. Haywood (Brentford), Mr. R. Ames (Nottingham), and Mr. P. Keap (London).

The members met at the offices of the urban district council, where they were received on behalf of the council by the chairman, Councillor J. Wakeford, J.P. In extending a hearty welcome to the visitors, Mr. Wakeford recalled that eight years ago, when he happened to occupy the same position he did now, he had the privilege and pleasure of greeting a similar gathering to that which he was now addressing. Although they had no historical places of interest at Sutton to show them, they claimed to be more or less pioneers in the particular description of sewage disposal which, since its inauguration here, had been universally commended throughout the civilised world. He might say that they had as one of their colleagues on the urban council Mr. Chambers Smith, who was at one time surveyor to the council, and helped in the commencement of the sewage disposal scheme which they were working to-day. They congratulated themselves upon having such a gentleman on their council, and that they had his help in carrying out the important task entrusted to them.

Mr. Wakeford having retired from the chair, the chairmanship of the meeting was assumed by Mr. W. L. Strachan (Aldershot).

A vote of thanks to Mr. Wakeford was moved by Mr. J. D. Croll (Richmond), seconded by Mr. J. H. Barford (Maidenhead), and carried by acclamation.

Mr. W. HEDLEY GRIEVES, engineer and surveyor to the council, then proceeded to read some—

NOTES ON THE SEWAGE DISPOSAL AND PURIFICATION WORKS AT SUTTON.

Mr. GRIEVES said: I have much pleasure in adding my welcome to the association to that of the chairman of the council, on the occasion of their second visit to the Sutton Sewage Disposal Works. It is ten years since I had the pleasure of welcoming the association to the Buxton Sewage Works, during the time that I held office there as engineer and surveyor. Buxton, like Sutton, was looked upon in those days as one of the pioneers of sewage purification, for at Buxton the Local Government Board granted a loan for the borrowing of £1,600 for extensions to their works, without imposing the necessity of purchasing additional land for land treatment. That was the first time for which the sanction had been received without that imposition. Then again, Buxton led the way in the provision of percolating rotary sprinklers, for when they put down the scheme of seven sprinklers of various sizes, that was the largest installation at that time in this country. Some years prior to that—namely, in the year 1896—Mr. W. J. Dibdin, who at one time was a member of this council, suggested, as a consequence of the successful experiments carried on by the Massachusetts State Board of Health, the construction of a bed for the treatment of crude sewage without the aid of chemicals or settling tanks, and in November of that year, in my predecessor's time, the first of its kind ever constructed in this country was put into operation. This bacteria bed was composed of lumps of burnt clay ballast of 2 to 4 in. gauge and 3 ft. 6 in. in depth. Upon this was passed the crude sewage without any previous sedimentation, floating paper only being removed by screens. The sewage was held up in the bed for two hours, and the outlet valve was opened, and the effluent from which the fouler organic matter was destroyed by the agency of bacteria formed in the bed was drawn off and led on to another filter, called a fine-grain bacterial bed, the media being breeze of a gauge of from ¼ in. to ⅜ in. The effluent was similarly retained in this bed for two hours, after which it was drawn off and discharged direct into the Pylbrook. Everyone remembers how the system thus inaugurated at Sutton seemed to alter the whole aspect of sewage treatment, and it was hoped would solve the great question of dealing with the sludge in sewage. But we still have the sludge problem with us, and, although the bacterial system then introduced has revolutionised the whole question of sewage treatment, the difficulty of disposing satisfactorily of the sludge has not been disposed of. The visitors' book at the farm will show how the new departure was received, for representatives from local authorities, not only in this country, but practically from all over the world, have visited the works, and the biological process was adopted in some form or other by many other public authorities.

When it was found that in the working of these coarse grain beds the capacity, owing to mineral and other matters, was reduced to such an extent, it was decided to adopt sedimentation or septic tanks, in order to prolong the life of the beds.

The Sutton Sewage Works were originally constructed some twenty-five years ago, and comprised an area of about 25 acres. At that time they were designed for the treatment of the sewage by chemical precipitation and broad irrigation. In this process lime and sulphate of iron were added to the sewage before it ran into the settling tanks, of which there were six, of the capacity of 50,000 gallons each. In these tanks the sewage was allowed to rest for a number of hours when the solids in suspension were precipitated to the bottom of the tank. The clarified sewage was then drawn off by floating arms, and then deposited upon the land. The sludge was drawn off and pressed into cakes, which were found to be unsaleable. The clay subsoil of the land upon which the effluent was turned was found to be unsuitable for purifying the sewage from the precipitation tanks, and complaints were received of the impurity of the effluent. It was then that the double contact system was brought into operation. The sludge pressing machine was sold and the sludge lagoons now in operation are used in their place.

The area of the district is 1,836 acres. The estimated population is 22,500. The birth-rate is 17·8 per 1,000 and the death-rate 9·3. The rateable value is £169,000.

HIGH-LEVEL WORKS.

The sewage is delivered to the works by two levels—namely, the high level and the low level. The average daily flow of the high-level sewer is about 500,000 gallons, and that of the low level 250,000. The separate system of sewage is in vogue in the district. When the sewage is delivered at the high-level works it is passed into three septic tanks with a capacity of about half a day's flow. Part of the sewage is then passed on to contact beds, and the remainder on to percolating filters.

There are five coarse and seven fine grain beds at the high level, with a capacity of 351,000 gallons. There are also two percolating filters, each with a diameter of 80 ft. and 5 ft. 6 in. deep, supplied by Messrs. Adams-Hydraulics, Limited, and one filter 100 ft. diameter, supplied by the Ames Crosta Engineering Company. The latter was constructed in 1913. The first sprinkler was constructed in 1908, and the second in 1909. The 100-ft. sprinkler is only 3 ft. 9 in. deep.

The coarse or first contact beds take one hour filling, two hours in contact, and one hour emptying; then the fine beds take one hour to fill, two in contact and one to empty. It will be seen that the sewage from the time of leaving the septic tank to leaving the fine contact bed takes eight hours.

The adoption of percolating sprinklers will effectively do away with the contact beds, as the experience we have found is that not only does the contact bed require more space and more time in the process of purification than the sprinkler, but the effluent from the contact beds is not so satisfactory. The sewage from the percolating filters after leaving

the septic tank is discharged into the stream in two hours, as against eight for the contact bed. When the last sprinkler was constructed at the high-level works a new humus chamber 35 ft. square was constructed; this contains two hours' flow.

LOW-LEVEL WORKS.

Here there are three septic tanks, with a total capacity of 103,000 gallons. There are five coarse and five fine beds at the low-level works, and one 80-ft. diameter rotary sprinkler, which is one of the Candy-Whittaker type. Part of the sewage after passing through the septic tanks is passed on to the sprinkler and the remainder to the coarse and fine beds; but to-day the chairman of the Farm Committee will formally start a new sprinkler 66 ft 6 in. diameter, which has been supplied by the Ames Crosta Engineering Company.

This sprinkler has been constructed on the site of two fine-grain beds, which, after to-day, along with the two corresponding coarse-grain beds, will be dispensed with, and the committee at their last meeting decided to construct during the next half-year another sprinkler exactly similar to this one. The depth of these sprinklers is 3 ft. 6 in. The filtering media has been supplied, as in the case of the last 100-ft. sprinkler, by Mr. Frank Keep. At the low-level works we have very little fall between the inlet of the sewage and the screen into which the whole of the effluent is turned; therefore it was necessary to construct the 80-ft. filter below the surface of the ground.

THE EFFLUENT CROPPING, AND DISPOSAL OF SLUDGE.

The whole of the effluent on both high and low level beds discharges directly into the Pylbrook, which is under the jurisdiction of the Port of London Authority, who regularly takes samples of the effluent from the various beds. Although the land originally intended for the purposes of irrigation is of the heavy London clay and is not used at all for irrigation purposes, with the application of ashes and the sludge from the works, it makes capital land for growing crops upon. The crops that are being cultivated at the present time are potatoes, on about 4 acres, and lucerne on about 7 acres. Other crops that have been grown at various times are mangolds, swedes, peppermint and rye-grass. The average amount received by the sale of the various crops during the last three years is £80 to £90 per annum. We have only grown lucerne for about two years, and it has proved to be a profitable crop. Already we have had two crops this year, and the third is being got. Osiers have also been grown as well as cricket bat willows.

The sludge from the sedimentation tanks from the high-level works is discharged three or four times a year by gravitation to the sludge lagoons. That from the low-level tanks is pumped to the high level. There are three lagoons, one of which was constructed two years ago. The drainage from the lagoons is discharged into the low-level sedimentation tank, and when the sludge is dry it is carted up and put out on to the farm, or brought away by farmers, a charge of 4d. per load being made.

There are two 8-h.p. Atkinson's gas engines, one 3½-h.p. engine which was used for mixing chemicals, one air compressor, and two ram pumps capable of lifting 20,000 gallons each per hour against a head of 32 ft. One engine and one pump are used once a week for pumping the sludge out of the low-level tanks into the high level. The remainder of the machinery is not now used.

WORKING COSTS.

I submit a statement of the cost of working the sewage farm for the last few years. This includes

March.	Sewage disposal.	Sewage farm.	Works extension.	Total.	Income for year.
	£ s. d.	£ s. d.	£ s. d.	£ s. d.	£ s. d.
1910	530 14 11	270 5 0	970 2 0	1,771 0 11	115 7 5
1911	590 14 6	265 5 3	292 17 0	1,148 16 11	153 19 9
1912	580 0 9	297 15 0	—	897 15 9	298 7 1
1913	685 18 4	331 2 1	1,226 14 4	2,174 14 9	226 19 4
1914	559 17 9	290 15 8	280 18 4	1,169 11 9	160 3 1
		Rebuilding stables	64 3 4		
1915	547 11 0	271 0 6	13 19 6	930 3 4	134 9 8
	£4,434 17 3	£1,768 0 8	£2,887 14 6	£8,031 1 5	£1,118 6 4

the improvements that have been carried out by administration and out of current rate without having to apply to the Local Government Board for sanction to borrow.

In concluding this statement I would like to express my gratitude to the chairman of the committee, and the members of the council generally, for their assistance in carrying out duties, oftentimes difficult and arduous, and to express my satisfaction at the loyalty and devotion to duty of Mr. Joseph Taylor, the manager at the farm, who has superintended the carrying out of the improvements made from time to time, and whose practical knowledge is of the greatest value.

The company were conveyed in vehicles to the sewage disposal works in Clensham-lane, and were agreeably surprised to note that the approach to the works is tastefully laid out with flowers and shrubs, resembling the entrance to a park, and that almost on every hand flowers formed a welcome feature of the scene. After an inspection of the various objects of interest the visitors assembled at the low-level works for the formal inauguration of the new 66-ft. sprinkler.

Mr. R. W. Wootten, chairman of the Sewage Farm Committee, after a brief explanatory statement, turned on the flow of sewage to the new sprinkler.

Mr. Chambers Smith, in moving a vote of thanks to Mr. Wootten, said it was twenty years since the bacterial system of treatment was adopted. It was put down at Sutton with the assistance of Mr. Dibdin in 1896, and for three years they received 300 deputations yearly to inspect the works. Sutton had been called the Mecca of the bacterial sewage purification process, and it undoubtedly was. The contact-bed system was very good, but a process of advancement and evolution was effected by the introduction of the percolating filter.

Dr. Hooper seconded the proposition, which was duly carried.

After tea, which was generously provided by the members of the urban council, Mr. Reginald Brown (Southall-Norwood) said he noticed that at Sutton they had an extremely low death-rate, but he could not congratulate them upon an extremely low birth-rate, for they wanted a high birth-rate. As to the works, they could not leave without giving expression to the admirable way in which these had been constructed, and the admirable way in which they had been arranged by Mr. J. Taylor. No engineer could hope for a better works manager than Mr. Grieves had. It was no use putting a man in charge of a ship unless he had a good lieutenant, and a good lieutenant should be well paid. As a rule, local authorities were willing to spend with both hands for a water supply and for taking the waste water into the sewage works, but when it got there it was a case of out of sight out of mind. They forgot about the all-important thing of conveying the water back to the river purified. He was quite certain there was no better effluent in the whole of Surrey than that which came from the Sutton sewage disposal works. Mr. Brown concluded by moving a vote of thanks to Mr. Taylor for his attention to the visitors.

Mr. J. H. Blizard (Southampton), in seconding, remarked that the visit had proved very instructive. He was greatly impressed with what he had seen, and he would suggest that the fish pond near the outlet should be considerably enlarged. He also suggested that as they aimed at beautifying the sewage works with plants and shrubs, they should make them a show place for the inhabitants and invite them to see the beauties of the place, and how the money was being spent. He felt that sewage disposal works were quite as important to the community as waterworks.

Mr. Wakeford, chairman of the urban council, expressed his indebtedness to the Ames Crosta Engineering Company and to Mr. Frank Keep for the way they had worked with the council. They had helped very considerably in getting things through, and such assistance was particularly valuable in these awkward times. The members of the committee felt very pleased indeed with the way these gentlemen had carried out their work.

Mr. J. Duxbury (Grays), in moving a vote of thanks to Mr. Grieves, said he was very pleased to see the state of the works when the labour difficulties were considered. He hoped the members of the urban council would feel that if they wanted to keep men they must pay them at the same rates as other men were paid in the labour world. They must remember that it was a difficult thing to get men to look after sewage disposal works.

Mr. J. Hughes (Hampton) seconded, and remarked that he had noticed several improvements in the works since his previous visit some years ago. The percolating filter was an improvement, and he thought they had proved that at Sutton. He was gratified

to find that the members of the urban council took so much interest in the sewage works.

Mr. Taylor briefly acknowledged the compliment.

Mr. Grieves emphasised the value of visits of inspection to various sewage disposal works, and with regard to Messrs. Ames Crosta and Mr. Frank Keep, he said they were greatly indebted to those gentlemen. He believed the new sprinkler would prove a very satisfactory job, and he was sure they could not be better supplied with media anywhere. He quite agreed with the suggestion about beautifying sewage disposal works. Alluding to the presence that day of many councillors, including several lady councillors, Mr. Grieves said it helped an official to find he was supported by the members of the local authority.

Mr. Reginald Brown, commenting on the cost of the works per head of the population, said the cost at Sutton was exceedingly low.

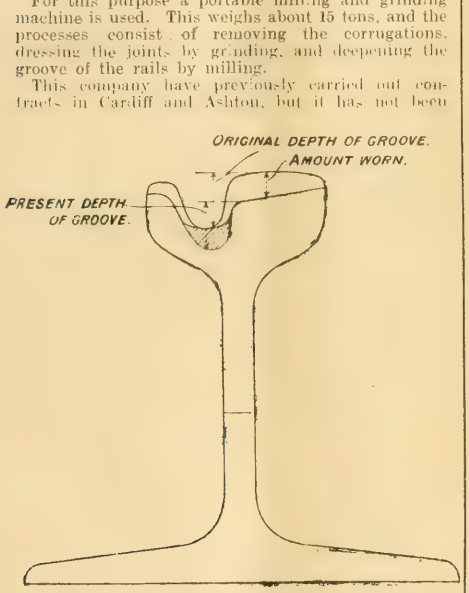
In reply to Mr. J. A. Webb (Hendon Rural District Council), Mr. Grieves said the inclusive cost of the new installation was £350.

REMODELLING TRAMWAY RAILS IN WIGAN.

The Woods Gilbert Rail Planer Company, Limited, have recently completed a contract with the Wigan Corporation under the borough engineer, Mr. A. T. Gooseman, for remodelling 4 miles of tramway track, and the work has been such a success that further contracts have been entered into.

For this purpose a portable milling and grinding machine is used. This weighs about 15 tons, and the processes consist of removing the corrugations, dressing the joints by grinding, and deepening the groove of the rails by milling.

This company have previously carried out contracts in Cardiff and Ashton, but it has not been



Section of Tramway Rail Before and After Deepening.

used very extensively in this country. Many miles of track have been remodelled by this process in Australia.

Before the track at Wigan was remodelled the rails were completely worn out. The wheel flange was right at the bottom of the groove, which was only ⅛ in. deep, and in some cases less. A ¼ in. has been drilled out of the groove bottom, leaving a new groove ⅜ in. deep, which will add at least five or six years' life to this track, at a cost of £530 per mile. This has turned out a great war-time saving.

The machine originally had a petrol engine. This created a great noise, however, and the machine now runs with electric motors, with the result that the noise nuisance has been abolished.

Coast Sand Dunes (By Gerald O. Case, St. Bride's Press, Limited, 24 Bride-lane, E.C., price 5s.).—Mr. Case has done a valuable work in the writing of this book.—*Southport Guardian.*

BRITISH DE-TINNING SCHEME.

ACCEPTANCES FOR FORTHCOMING MEETING IN LONDON.

Appended is a full list of the local authorities who up to the time of going to press have intimated their intention of being represented at the forthcoming meeting in London at which the British De-Tinning Company will outline their scheme for enabling those bodies in future to participate in the profit derived from the utilisation of their waste metals. The figures in parentheses denote the population of the various towns and districts.

Acton (60,000), Aylesbury (11,000), Accrington (45,000), Bushey (7,000), Brentford (17,000), Basford (42,000), Barnes (14,000), Blackwell, Buckingham (3,000), Beckenham (32,000), Battersea (168,000), Beddington and Wallington (18,000), Barry (5,000), Colchester (44,000), Chelmsford (18,000), Chiswick (39,000), Cheshunt (13,000), Caterham (11,000), Colne (26,000), Colwyn Bay (13,000), Carshalton (12,000), Chatteris (5,000), Chingford (8,000), Chesterfield (38,000), Darlington (56,000), Deptford (110,000), Daventry (4,000), Dorking (8,000), Dover (44,000), Dartmouth (7,000), Easthampstead (3,000), Epsom (19,000), Exmouth (12,000), Edmonton (65,000), Enfield (56,000), Exeter (37,000), Ealing (61,000), East Ham (134,000), Finchley (40,000), Farnborough (14,000), Fulham, Finsbury (10,000), Folkestone (34,000), Grimsby (75,000), Glasgow (785,000), Grays (16,000), Greenwich (96,000), Guildford (24,000), Gainsborough (21,000), Hannon-on-the-Hill, Hampton (9,000), Horsham (11,000), Hemel Hempsted (13,000), Hounslow (31,000), High Wycombe (20,000), Hereford (23,000), Harwich (14,000), Ipswich (74,000), Ilkeston (32,000), Ilchen, Kingston-upon-Thames (38,000), Keighley (44,000), Loughton (5,000), Loughborough (23,000), Luton (50,000), Lewes (11,000), Lichfield (9,000) Limerick 50,000), London (City), Malvern (8,000), Market Harborough (9,000), Margate (27,000), Morecambe (12,000), New Malden (16,000), Northampton (90,000), Norden, Nuneaton (27,000), Portsmouth (231,000), Paddington, Purley (3,000), Retford (18,000), Rochester (32,000), Ramsgate (30,000), Richmond, Surrey (33,000), Reigate (29,000), Southgate (34,000), Surbiton (18,000), Sutton Coldfield (20,000), Salford (232,000), Swadlincote (4,000), Slough (15,000), Stroud (9,000), Southampton (119,000), Scarborough (37,000), Southend-on-Sea (63,000), St. Pancras, Sudbury, Suffolk (7,000), Stoke Newington (51,000), Stepney (280,000), Sheringham (4,000), Sutton 21,000), Seaford (5,000), Shoreham-by-Sea (6,000), Sheffield (460,000), Stapleford (8,000), Swansea (115,000), Swaffham (3,500), Skegness (4,000), Tonbridge (15,000), Tunbridge Wells (36,000), Twickenham (29,000), Teddington (16,000), Worthing (30,000), Walthamstow (125,000), Wellington (8,000), Watford (41,000), Windsor (13,000), Wembley (11,000), Woolwich (121,000), West Bridgeford, Ware (6,000), Walsall (92,000), Wokingham (4,000), Wandsworth (311,000), Woodford, Essex (19,000), Westminster (City) (160,000), Wood Green (50,000).

THE SOUTHWARK WORKS.

Pressure on our space makes it impossible to publish this week the plans of the de-tinning works which are being erected at Southwark, but we hope to be able to include them in our next issue.

Housing After the War.—A deputation to Mr. Walter Long on Wednesday from the Housing and Town Planning Congress which met some months ago to consider after-the-war problems, asked the Government to set aside £20,000,000 to make advances to local authorities and other agencies to enable them to provide houses for the working classes at reasonable rentals. Mr. Long replied that he was not going to make any announcement as to any particular sum. He was not at all sure that twenty millions was even an index of what might be required. If the Government came to the assistance of local authorities it must be on liberal lines. There should be generous consideration shown to country districts, because it was vital to the future of the race that there should be provision for as many as possible in the country districts in order to keep occupied on the land as large a population as possible. In regard to the demand that the legislation promised by the Government in 1913 and 1914 to amend the Finance Act of 1909 in order to remove an obstacle to the building of working-class houses should be carried, Mr. Long said that he regarded the Government as pledged to carry a measure of reform, and he hoped that when it came it would be complete, because he was confident that it was necessary.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars have reached us during the present week. Other reports will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Argyll C.C.—The Lorn District Committee have received an intimation that the Road Board will be prepared to make a grant of £5,000 for the construction of the bridge over the Clyde.

Margam U.D.C.—The question of the provision of a public mortuary is under consideration.

Morley T.C.—It is proposed to construct a public convenience in Bridge-street.

HOUSING AND TOWN PLANNING.

Knaresborough U.D.C.—A letter has been received from the Local Government Board asking if the council had considered the advisability of applying for sanction to a scheme under the Town Planning Act for the preservation of certain amenities, and incidentally referring to the question of securing control of the River Nidd and banks as mentioned by the council in letters. Councillor Cassells: Does that mean if we adopt the Act we get control of the river banks as well? The chairman (Mr. J. Stead): It seems rather a remarkable thing, the board now asking us to do something for which we made application only a month ago and which was not then entertained. It is the very thing we asked permission for, the obtaining and preserving of the river bank. The council sent the matter to the General Purposes Committee for report.

Sunderland T.C.—The town council on Wednesday adopted an instruction to the Health Committee to consider and report upon the adequacy of the housing provision in the borough for the working-class population.

MOTOR TRANSPORT.

Bradford T.C.—It has been agreed to purchase for £500 a 2-ton petrol dust-cart tip wagon, for the use of the team labour department.

Elland U.D.C.—An estimate is to be obtained for the conversion of a horse ambulance into a motor ambulance.

Littlehampton U.D.C.—The council are considering the purchase of a motor fire engine.

REFUSE COLLECTION AND DISPOSAL.

Dufftown T.C.—The surveyor, Mr. H. McKay, has reported in favour of a weekly collection of house refuse. He said he found in the course of inquiries that eight or nine ashpits had not been cleaned out for nine months.

Tiverton T.C.—The borough surveyor, Mr. J. Siddall, reports that during the past six months waste paper has been collected to the value of £20 14s. 2d. The weight of the material was 11 tons 12¾ cwt., and the cost of collection and baling expenses £16 12s. 9d., leaving a balance of £3 1s. 5d. Added to this is the saving on the cost of hauling to the refuse tip, thirty loads at 2s. 6d. = £3 15s., making a saving on the six months of £7 16s. 5d.

ROADS AND MATERIALS.

Blackburn T.C.—A sub-committee has been appointed to consider the question of the wages and reorganisation of the street sweeping department.

Holland C.C.—The council have sanctioned an expenditure of £267 on tar-spraying the Boston to Skeggness road, the Road Board having agreed to contribute 40 per cent of the cost. It has been decided to appeal for exemption from military service for Mr. A. W. Lloyd, the surveyor for South Holland.

Kiveton Park R.D.C.—The Local Government Board were at a recent meeting criticised by the council for refusing permission to improve Leopold-street, Dinnington, the cost of which the owners of property in the street have offered to meet.—The chairman described the thoroughfare as a quagmire, but the Local Government Board expressed the opinion that this was not a fitting time for street improvement, even though there would be no cost to the ratepayers.

Linlithgowshire C.C.—Strong protests were made at the Linlithgow District Committee on Monday on the subject of the heavy motor char-a-banc traffic on the Queensferry to Edinburgh road. It was stated that, while £3,000 had recently been expended on the repairing of this road, it had been reduced again to a very bad condition by this traffic. It was agreed that steps should be taken to have the motor traffic modified.

Rhyl U.D.C.—The council have decided to accept a tender of £279 for providing screens on the foreshore for preventing sand-drift, but they have declined to accept the only tender received for removing the remains of last winter's huge drift, instructing the surveyor, Mr. A. A. Goodall, to obtain prices for plant and the cost of removing the accumulation by local labour.

Taunton T.C.—The Streets and Highways Committee stated that the Somerset County Council, when making payment for the maintenance of the main roads in the borough during the year ended March 31st last, deducted the sum of £85 from the amount claimed by the corporation. This step was consequent upon a communication received from the council last year, when it was suggested that a saving could be effected if the roads were scarified by mechanical means instead of by hand labour, the suggestion being supplemented by an intimation that the county authority would in future only be prepared to pay for scarifying upon the basis of the proper cost per superficial yard of effective steam scarifying. The town council in the circumstances have appealed to the Local Government Board to determine the amount of the payment to be made by the county council in respect of the maintenance of the main roads in the borough during the past year.

SEWERAGE AND SEWAGE DISPOSAL.

Belper R.D.C.—It has been agreed to inform the Local Government Board that the works contemplated by the council after the war will include the Allestree Bridge, Crich, and Horsley Woodhouse sewerage schemes and the Allestree water supply.

Stockbridge U.D.C.—The surveyor, Mr. G. W. Battye, has been instructed to report on the proposed sewerage extension at Hawthorn Brook, and on the question of sewage disposal.

Weston-super-Mare U.D.C.—The council have adopted a scheme prepared by the surveyor, Mr. H. A. Brown, for dealing with the present unsatisfactory condition of the Milton sewage pumping station. The work, which involves the erection of a new station on an adjoining site and the provision of ejectors operated by compressed air from the waterworks pumping station, will be commenced as soon as possible.

WATER, GAS, AND ELECTRICITY.

Brighton T.C.—The Lighting Committee have submitted a report on a proposal to lease a site at the electric power station at Shoreham Harbour to the British Coalite Company, Limited, for the treatment of coal for the production of a high grade smokeless fuel and other distillates used largely in the manufacture of dyes, high explosives and oils. The company propose, in return for the concession, to sell to the corporation, at a low rate, a large surplus volume of gas of good calorific value, suitable for firing boilers. The corporation would have to expend at least £750, plus the cost of pipes, to adapt a section of their present boilers for burning gas instead of coal, and it is estimated that by so doing a reduction of about one-half in the cost for fuel for the production of the units thus generated will be effected.

Goole U.D.C.—It has been decided to increase the price of gas to ordinary consumers from 3s. 6d. to 3s. 9d. per 1,000 cubic feet.

Nelson T.C.—Negotiations are proceeding with the Ministry of Munitions with respect to the installation of a benzol recovery plant and rotary washer-scrubber at the Brierfield Works. The department were unaware that vertical retorts were installed at the works, and they asked that samples of tar should be forwarded to the technical expert in London for

analysis, prior to the installation being proceeded with.

Preston R.D.C.—The question of the proposed supply of 50,000 gallons of water daily to new works of Leyland Motors, Limited, at Farington, has been referred to the Water Committee.

Weston-super-Mare U.D.C.—A special committee has been appointed to consider the desirability of carrying out certain suggested improvements at the waterworks pumping station.

Kirkcaldy T.C.—The town council have decided to engage Sir John Snell to report on the whole question of the supply of electricity in the burgh.

Halstead U.D.C.—Upon the suggestion of the surveyor, Mr. J. R. Fayers, it has been agreed to instal a water level indicator at the main pumping station, for the guidance of the engineer, and an indicator and recorder in the office for the checking and recording of water levels and working of engines and pumps. It is proposed to include a sum of £90 in the estimates to cover the cost.

MISCELLANEOUS.

Buckie T.C.—The town council have provisionally resolved to schedule the following works among the schemes to be carried out after the war: (1) Completion of original scheme of harbour extension; (2) provision of workmen's houses; (3) paving of Low-street and Commercial-road.

Esher and the Dittons.—On the ground of the higher cost of living, the eighty-two workmen in the outside department of Mr. H. C. Fread, the surveyor, have hitherto received a work bonus of 2s. a week each. This has now been increased to 4s. per week.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRY HELD.

Neath T.C. (September 13th. Mr. George L. Pepler.)—This was an inquiry into an application for authority to prepare a town planning scheme, with reference to an area situate within the parish of Llantrait Lower in the adjoining rural districts.—The town clerk (Mr. Edwin C. Curtis) and the borough engineer (Mr. D. M. Jenkins) represented the corporation, and gave the necessary explanations and evidence in support of the application. The chairman, clerk and engineer of the Neath Rural District Council also attended, to support the application. This is the second application made by the corporation under the Housing and Town Planning Act, and the additional area now in question is intended to be combined, under one scheme, with the area within the borough for the town planning of which the authority of the Local Government Board has already been obtained.

APPLICATION FOR LOAN.

Blackburn T.C.—£10,450 for the completion of Parsonage reservoir.

LOANS SANCTIONED.

Bradford T.C. £3,700 for the purchase of three electric tipping wagons.

Leeds T.C.—£20,000 for electricity mains, and £15,000 for new sub-stations.

Wembley U.D.C.—£667 for the Ealing-road improvement.

FORTHCOMING INQUIRIES.

SEPTEMBER.	£
26. **Wigan.** For works of sewerage (Mr. W. O. E. Meade-King)	3,515

FOR OTHER ADVERTISEMENTS

See End of Paper.

SOMERSET COUNTY COUNCIL.

Wanted, Temporary Junior Assistant, ineligible for the Army. Candidates must be neat draughtsmen, and should be able to make surveys and take levels. Salary £80 per annum. Applications, stating age, qualifications and experience, should be accompanied by copies of not more than three testimonials, and be sent to the undersigned, endorsed "Junior Assistant."

GORDON R. FOLLAND,
Acting County Surveyor.

Wells, Somerset. (3,104)

PERSONAL.

Police-constable Longhurst was at Bow-street on Monday presented with £10 for descending a main sewer at Woolwich and rescuing a man overcome by gas.

Mr. H. Lee Jones, assistant borough surveyor of Denbigh, has been appointed surveyor and inspector to the Elland Urban District Council, in succession to Mr. F. W. Tillotson.

Mr. F. Philip, road surveyor to the Ellon district of the Aberdeenshire County Council, has had his salary increased from £185 to £200, and his allowance for travelling expenses increased to £10.

Messrs. J. Prisk, J. Williams, and J. R. Cummins, surveyors to the Helston Rural District Council, have been granted increases of salary for the duration of the war "or until the resumption of normal prices."

Mr. Wentworth Jones, borough surveyor and inspector of nuisances of Thetford, has joined the Army. The town council have resolved to keep his position open for him until the expiration of the war, and make him an allowance of £1 per week.

Mr. E. Holloway, surveyor and sanitary inspector to the Evesham Rural District Council, has been appointed a surveyor to the Royal Flying Corps, and the council have appointed Miss McConnell surveyor and inspector temporarily at a salary of £2 per week.

Lieutenant Herbert James, of Birmingham, who won the V.C. at Gallipoli, figured prominently in the illustrated journals in connection with his marriage last week, at Stoke Damarel Parish Church, to Miss Gladys Beatrice Lillicrap. The bride is the eldest daughter of Lieutenant F. W. Lillicrap, R.E., who was formerly water engineer to the Devonport Corporation.

Corporal Thomas Oldroyd, of the 1/2nd Bucks Territorials (who was a clerk in the surveyor's office at High Wycombe), has been recommended for the Military Medal. A report by Captain and Adjutant G. E. W. Bowyer concerning Corporal Oldroyd reads as follows: "On July 19, 1916, he worked for six hours under fire in communication trench, mending wires, and established communication a few minutes before the attack started, and continued to work instruments in front line under heavy fire. It was solely due to this that successful communication was maintained between front line and Battalion Headquarters throughout the attack."

BARTON HILL BATHS, BRISTOL.*

By H. W. HARDING,
Chief Engineering Assistant, City Engineer's Office.

One of the most interesting sections of this establishment is the bath compartment, known as "Kane's Baths," introduced into this city by the present superintendent of the Bristol Corporation Baths.

The special feature of this bathing compartment is that the bathroom is kept separate from the dressing-room, as it is claimed that, whether slipper, spray or needle baths are the cleansing medium employed, it is essential that the bathing compartment should be maintained at a considerably higher temperature than the dressing compartments, both as a means of more thoroughly cleansing the body and as a preventive of chills to the bather. In addition to this the bather is able to employ a continuous flow of clean water, the soiled water immediately running away.

The system consists of a specially-designed bathroom, lined with white glazed bricks, in which are placed the bath compartments, fitted with slipper, spray, shower and needle baths, or a combination of each, separated from a series of dressing rooms, situated on either side, each opening direct on to a gangway communicating with each bath compartment.

Arrangements are made for the heating of these rooms so that an ample supply of fresh warm air is delivered to each bathroom, at a temperature of 110 deg. Fahr., and to each dressing-room at 65 deg. Fahr.

The heating medium is a steam tubular heater, and high pressure blower, fitted with electrical induction motor, placed in the chamber below the bathroom, which can be worked by the attendant above. Exhaust gratings and flues provided in the adjoining walls (capable of adjustments to suit any conditions) connect up to a ventilating turret on the roof.

Lavatory basins are provided in each bathing compartment

* Extracts from paper submitted at the Southern District meeting of the Institution of Municipal and County Engineers, held at Bristol on Saturday last.

SOME RECENT PUBLICATIONS.*

Waterworks Handbook. By Alfred Douglas Flinn, Robert Spurr Weston and Clinton Lathrop Bogert. (First edition.) Three hundred and eleven tables and 411 illustrations. Price $6. New York: McGraw Hill Book Company.

This handbook, just published, is a compendium of data of every sort for the waterworks superintendent, designing engineer, analyst and inspector. It is in no sense a text-book, although it contains a vast amount of information from which the teacher may abstract valuable lessons for his students, and with which he may illustrate the principles of the science of waterworks engineering. It is not a formal treatise, although the various subjects are taken up in orderly fashion so as to make the book, as nearly as possible, self-indexing. It is a handbook in which the separate, self-contained paragraph is the unit, each paragraph bearing a conspicuous explanatory heading. As for the subject-matter, it is taken from a great variety of sources—old and new—from text-books, engineers' reports, scientific papers, specifications, and even from trade catalogues. References to the original sources are usually given, so that the volume is a guide-book as well as a handbook. Naturally, the authors have drawn largely from their own experience, and in this respect the experiences of the senior author, Mr. Flinn, as deputy chief engineer of the city of New York have been unique among modern writers on water supply. Mr. Flinn has not only been familiar with the details of this greatest of modern water supply undertakings, but he has himself been a large factor in the organisation of the work. Many of the ideas embodied in the specifications of the Board of Water Supply are given in abridged form in the handbook.

The book is divided into five parts, which treat respectively of sources of water supply, collection of water, transportation and delivery of water, distribution of water, and the character and treatment of water.

Part I., comprising seventy-three pages, is devoted to rainfall evaporation, stream flow, and ground water. For the most part these topics are described along the usual lines, but the chapter devoted to evaporation is particularly complete. The chapter on run-off and stream flow contains tables showing the relation between rainfall and run-off of representative watersheds in the eastern part of the United States. This chapter is somewhat incomplete, in that it does not include some of the most recent applications of the laws of chance to rainfall and stream flow.

Part II., on the collection of water, covers 197 pages, and includes chapters on intakes, reservoirs, masonry dams and rock-fill dams, wells and infiltration galleries. Of these chapters, that on masonry dams is the most complete. It is an excellent treatise on the subject, containing many illustrations of high masonry dams. The chapter on wells describes the common methods of drilling wells, the use of test wells, and the air-lift method of pumping water. The chapter on infiltration galleries is disproportionately short.

Part III., on the transportation and delivery of water, covers 112 pages, and discusses in an excellent way the construction of aqueducts and steel and wooden pipes. These chapters contain many facts derived from the author's experience in the construction of the Catskill aqueduct.

Part IV., on the distribution of water, is the longest section of the book, covering 263 pages, and containing twelve chapters. It treats of cast-iron pipes, and special fittings as used in distribution systems, water meters, pumps, distributing reservoirs, standpipes and tanks. There are also chapters on water consumption and hydraulic computations. There are four miscellaneous chapters on masonry and puddle, conversion tables, and miscellaneous topics.

Part V. relates to the character and treatment of water. The chapter on character of water contains tables showing the chemical and biological character of water from different sources, such as rain water, river waters, lake waters, and sea water. Under the heading Inspection of Sources of Water Supply, rules and regulations governing the control of watersheds are given. There are short chapters on storage and sedimentation. The chapter on aëration and chemical treatment is more complete than the preceding, and describes the various chemical processes used for coagulation and disinfection, together with various devices now used for applying chemicals. There is a short chapter on water softening. The chapter on filtration describes the various methods now used, and gives tables of data relating to some more important slow sand filter plants and mechanical filter plants used in America. This chapter also contains the standard forms for filter statistics recommended by a committee of the New England Waterworks Association. The last chapter of the book is a *resumé* of the standard methods of water analysis of the American Public Health Association.

It would be impossible in this brief review to give more than a passing notice to the different topics included in the "Waterworks Handbook." Suffice it to say that the compilation, while not exhaustive, is unusually complete, and there is no doubt that the work will almost immediately find its place on the shelves of waterworks engineers and superintendents as a standard treatise.

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

STREET PAVING IN AMERICA.

TYPES OF SURFACING RECOMMENDED FOR BOSTON.

A committee of engineers appointed to make recommendations as to the policy to be followed in repaving the Boston city streets has submitted the following proposals:

Class 1. Heavy Traffic Streets.—Granite blocks laid on Portland cement-concrete base not less than 6 in. in thickness, the joints to be filled with Portland cement-grout; in the case of excessive grades, pitch to be substituted for grout in the upper inch or so of the joints in order to provide better foothold for horses.

Class 2. Main Arteries.—The same type of pavement as Class 1, with a few exceptions where the surroundings require a smoother and less noisy surface, such as wood blocks or the best grades of bituminous pavements.

Class 3. Retail Shopping and Office Building Districts.—Treated wood-block pavements, the best grades of bituminous pavements on a Portland cement-concrete base. At the present time the only wood recommended for wood-block pavements is long-leaf yellow pine.

Class 4. Residential Districts in the City Proper.—Treated wood-block pavements, the best grade of bituminous pavements or Portland cement-concrete pavements, the choice to be determined by the intensity and character of the traffic.

Class 5. Suburb and Residential Districts.—Cheaper types of bituminous pavements, using old macadam surfaces for the base where suitable, or Portland cement-concrete pavements.

Class 6. Park Roads Carrying only Pleasure Traffic.—Bituminous pavements, using old macadam for the base where suitable, or Portland cement-concrete pavements.

Extra Cost of Reinstating Roads.—The Metropolitan Water Board, the General Post Office, and the Wimbledon Corporation have agreed to allow the Maldens and Coombe Urban District Council to increase by 25 per cent their charge for the reinstatement of roads and footways.

Seats for Wounded Soldiers.—The Highway Committee of the Sheffield Corporation have issued an appeal for the loan or gift of seats for the use of wounded soldiers. Up to September 14th approximately 100 seats had been given or lent for this purpose. They are placed in various parts of the city where soldiers gather, mostly in the central parts of the town. They have been found a great convenience to the men, and have caused little or no annoyance to the general public.

Universities and Engineering.—The Cheshire County Council Education Committee have made arrangements with the authorities of McGill University, Montreal, which will permit of young engineering students winning technological scholarships in Cheshire going to Montreal to have part of their three years' training at the McGill University. It is understood that the arrangement is reciprocal, and that McGill students will be accepted at English universities for a period of their training. The concessions are regarded with great interest in scholastic circles.

WATER PURIFICATION.

COPPER SULPHATE TREATMENT.

A successful campaign against tastes and odours due to organic growths in the water-supply of St. Paul, Minn., was conducted in 1915, on lines recommended the previous year by Mr. Allen Hazen, consulting engineer, New York City. The campaign, says *Engineering News*, was in direct charge of Mr. N. L. Huff, professor of botany, University of Minnesota, under Mr. G. O. House, general superintendent of the St. Paul Bureau of Water. The following information is taken from a paper by Professor Huff, read before the convention of the American Waterworks Association, in New York City, last June.

The water supply of St. Paul is taken from a series of lakes. A laboratory was established on the lower one, and a careful study made of the organisms in the lake before and after treatment with copper sulphate. The lake as a whole was treated three times, at a cost of $180 for material and $17·50 for labour each time. Special treatment of troublesome coves and shallows was also made at slight expense. The result of the treatment was a material reduction in the number of complaints of bad taste or odour from consumers.

The paper describes all the governing conditions and gives the mode and results of the treatment in detail. In conclusion, after naming the various classes of green and blue algæ, diatoms and protozoa found in the water during the campaign, Professor Huff says:

"With conditions under which above treatments were made, a treatment of one part of copper sulphate in 10,000,000 parts of water remains effective for about five weeks, after which time the organisms present, or many of them at least, seem to find conditions favourable for their growth and reproduction, and if the treatment is not repeated at this time they may increase again with remarkable rapidity.

"Where quiet shallow bays afford breeding places for numerous organisms, or where any one or more organisms become abundant in small or limited areas, local treatment or the application of small quantities of copper sulphate to the particular spot where the trouble is originating has been found very effective. If careful attention is given to such areas, and accumulations of organisms prevented here, the number of general treatments necessary to keep the lake clean for the entire season may be lowered, and the total cost of treatments materially reduced.

"For treatment of very shallow bays, flat muddy shores and small ponds the use of a hand pump such as is used for spraying trees is a practicable and economical means of distributing copper sulphate. In addition to spreading the solution in places inaccessible for a boat, this method has the advantage of leaving the water unrolled and gives the organism the full effect of the copper, much of which might otherwise be absorbed by mud and organic matter stirred up by a boat in such places."

Water Waste Prevention in Johannesburg.—A substantial reduction in the percentage of wastage of water in Johannesburg is reported by the town engineer, Mr. G. S. Burt Andrews, in his report for the year ended June 30, 1914. The quantity unaccounted for was 13·03 per cent, a decrease of 2·61 per cent on the previous year, and 5·70 per cent on the year 1911-12. This result has been brought about by careful supervision, a close examination of doubtful meters, and the taking out of defective mains.

A Treasure in the Trenches.—"A week ago," writes a corporal in the A.S.C.M.T., "I dropped my 'Swan' fountain pen near the trenches in the dark, and as it meant pretty certain sniping if I lit a match, I reluctantly had to abandon it. This morning I was passing that way again, and found my lost property 50 yds. from where I had missed it. Apparently a bursting shell had blown it down the road. I have had the pen in constant use ever since the early days of the war. That it stood the rough usage without ever failing me, and was as smooth in writing at the end as when first I had it, bears evidence of 'Swan' excellence and utility for soldiers at the Front." Thousands of "Swan" pens are being used by our men at the Front and in the Fleet, and, in truth, what more useful present could be sent to either soldier or sailor? Our readers would do well to ask the manufacturers, Mabie, Todd & Co., Limited, 79 and 80 High Holborn, London, W.C., for their free booklet giving full particulars.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. John S. Brodie, M.Inst.C.E., Borough Engineer and Surveyor, Blackpool.

EAST MIDLAND DISTRICT MEETING.

District Chairman—Mr. E. G. Mawbey, M.Inst.C.E., Borough Engineer, Leicester.

An East Midland District Meeting will be held at Melton Mowbray to-morrow (Saturday).

Programme.

2.0 p.m.—Meet at Colles Hall, where the members will be received by the chairman of the urban district council, Councillor Sholto H. Sikes, Esq., J.P.
District business.
2.30 p.m.—Paper, entitled "The Municipal Works of Melton Mowbray," by Mr. Edmund Jeeves, surveyor to the urban district council, to be followed by discussion.
4.0 p.m.—Tea, by kind invitation of the chairman of the council.
4.30 p.m.—Walk to destructor pumping station.
5.0 p.m.—Walk to Sewage Disposal Works.
5.45 p.m.—Return to Melton by way of Cattle Market.
(The distance to be walked is about a mile each way.)

W. H. A. Court,
Hon. District Secretary, pro tem.

Borough Surveyor's Office,
Leicester.

NORTH-EASTERN DISTRICT MEETING.

District Chairman—Mr. J. P. Wakeford, M.Inst.C.E., City Engineer, Wakefield.

A North-Eastern District meeting is to be held at Wath-upon-Dearne on Saturday, September 30th.

Programme.

10.15 a.m.—Meet at waterworks pumping station, adjoining Wath-upon-Dearne (G.C.Rly.) Station, and five minutes' walk from Wath-upon-Dearne Midland Station. Proceed to inspect the plant.
10.30 a.m.—Walk alongside the G.C. Railway to the new sewage disposal scheme in course of construction.
10.45 a.m.—Proceed to inspect the sewage disposal works.
11.30 a.m.—Proceed by motor 'buses from near Messrs. Stanley's oil works at Common-lane, along the main road *viâ* Barnsley-road and Brampton to Wath Wood reservoirs to inspect works there recently carried out. *En route* inspections will be made of the public baths, mortuary, sections of Tarmac roads, and private street works.
12.45 p.m.—Leave reservoirs by motor 'bus.
1 p.m.—Lunch at the Red Lion Hotel.
2.15 p.m.—Proceed to town hall, where the institution will be welcomed by the chairman of the urban district council, Councillor Chas. Adkins, J.P.
Business:
(1) Minutes of last meeting.
(2) Correspondence.
(3) Election of executive committee.
(4) Any other business.
(5) Orphan Fund and support from N.E. District.
(6) Paper on "Notes of Municipal Works and Statistics in the Urban District of Wath-upon-Dearne," by Mr. J. H. Drew, M.Inst.C.E.I., M.R.San.I. (Member), engineer and surveyor to the urban district council, Wath-upon-Dearne, will be discussed.
5 p.m.—Tea at the Red Lion Hotel, by kind invitation of County Councillor Richard Payne, member of the Wath-upon-Dearne Urban District Council.

EASTERN SUB-DISTRICT MEETING.

District Chairman—Mr. H. T. Wakelam, M.Inst.C.E., County Engineer, Middlesex.

An Eastern Sub-District Meeting (Norfolk, Suffolk and Cambridge) will be held at Stowmarket on Saturday, September 30th.

PROGRAMME.

11.30 a.m. Meet at the Stow Board Room (Market-place), when Mr. A. E. Ellis, J.P., chairman of the Stowmarket Urban District Council, also chairman of the Joint Sewerage Committee, will receive the members.

Read minutes of previous meeting.

Paper on "Municipal Engineering Work at Stowmarket," by Mr. Gerald W. Lingwood. (Copies of paper will be sent to members who signify intention of attending.)

1.0 p.m.—Lunch at the Fox Hotel. (Tickets, 2s. 6d. each.)

2.15 p.m.—Inspect sewage works, main sewage pumping station, waterworks electric light works, Combs electric sewage pumping station and Combs waterworks.

4.30 p.m.—Afternoon tea at the Fox Hotel, by invitation of Mr. G. W. Lingwood.

JOHN R. MEAD,
Hon. Sub-District Secretary.

Ipswich.

INSTITUTION OF MUNICIPAL ENGINEERS.

GLOUCESTER MEETING.

A meeting of the Western and South Wales Districts of the institution will be held at the New Inn, Gloucester, on Thursday, September 28th, at three o'clock.

AGENDA.

Election of district chairman.
Election of hon. district secretary.
Programme of meetings and visits for the year 1917.
Any other business.

JOHN BROOK,
Hon. District Secretary.

Salaries in New South Wales. A Sydney message states that Mr. Justice Heydon, in the Industrial Court, has dismissed the application of the Professional Officers' Association of New South Wales for the constitution of a salaries board to regulate the pay of civil engineers, architects, surveyors, barristers, doctors, solicitors, and other professional men in the employment of the Sydney City Council and other municipal councils.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

SURVEYOR.—September 25th.—Warblington Urban District Council. £160. Mr. W. L. Cooper, clerk, 14 Queen-street, Emsworth.

GASWORKS FOREMAN.—September 28th.—Wombwell Urban District Council. £2 per week, plus 4s. war bonus, with house, coal and gas. Mr. Percy M. Walker, clerk, Town Hall, Wombwell.

SURVEYOR AND INSPECTOR OF NUISANCES.—September 30th.—Barton-on-Humber Urban District Council. Mr. G. H. Nowell, clerk, Barton-on-Humber, Lincs.

TEMPORARY ENGINEERING ASSISTANT.—September 30th.—Corporation of Bedford. Mr. N. Green-Imeldi, borough engineer and surveyor, Town Hall, Bedford.

WATER INSPECTOR.—September 30th.—Corporation of Bedford. 40s. per week, with 5s. 6d. war bonus. Mr. N. Green-Imeldi, water engineer, Town Hall, Bedford.

SURVEYOR AND INSPECTOR.—October 2nd.—Llandilo Urban District Council. £80 per annum.—Mr. R. Shipley Lewis, clerk, Llandilo.

TEMPORARY INSPECTOR OF NUISANCES.—October 6th. — Chesterfield Rural District Council. £130-£140 per annum.—Mr. R. F. Hartwright, clerk, Union Offices, Chesterfield.

TEMPORARY CLERK.—Somerset County Council. £110 per annum.—Mr. Gordon R. Folland, acting county surveyor, Wells, Somerset.

TEMPORARY DIVISIONAL SURVEYOR.—Somerset County Council. £115 per annum. Mr. Gordon R. Folland, acting county surveyor, Wells, Somerset.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

HEMEL HEMPSTEAD.—September 27th.—For repairs and painting at the sewage pumping station, for the corporation.—Mr. W. R. Locke, borough surveyor and waterworks engineer, Town Hall.

Engineering: Iron and Steel.

SELBY.—September 26th.—For providing and driving piles and fixing waling, for the Selby Dam Drainage Commissioners.—The Surveyor, Lendal-chambers, York.

MANCHESTER.—September 27th.—For the supply of bolts, nuts and rivets, and offers for clean waste-paper, for the Cleansing Committee.—Mr. R. Williamson, superintendent, Cleansing Department, Town Hall.

ST. AUSTELL.—September 28th.—For the supply of about 1,760 yards of 5-in. or 6-in. cast-iron pipes, spigot and faucet joints, in 9-ft. lengths, for the rural district council.—Mr. J. Stephens, clerk, St. Austell.

MELBOURNE.—September 29th.—For the supply of cable, for the city council.—Messrs. McIlwraith, McEacharn & Co., Ppty., Limited, Billiter-square Buildings, London, E.C.

GISBORNE (New Zealand).—October 2nd.—For supplying and erecting a cooling tower for cooling the circulating water used for condensing 9,000 lb. of steam per hour, for the borough council.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, London, E.C.

ARGENTINE.—October 13th.—For the supply of 27,807 metric tons of light pipes and 32,164 metric tons of heavy pipes of cast-iron, for the Ministry of Public Works.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, London, E.C.

Mechanically-Propelled Vehicles.

DUBLIN.—September 26th. For the supply of a motor van, for the corporation. The Secretary, Markets Committee, City Hall.

BEDDINGTON AND WALLINGTON.—October 2nd. —For the supply of one 3-ton general-utility steam wagon, fitted with rubber tyres, for highway work, and one 3-ton steam wagon for the collection of refuse, for the urban district council.—Mr. S. F. R. Carter, engineer and surveyor, Wallington, Surrey.

Roads.

SOUTH MIMMS.—September 26th.—For the supply of Leicestershire or other broken granite, chippings, blast-furnace slag, gravel, hoggin or building shingle, and 6,000 gallons of distilled tar, for the rural district council.—The Surveyor, Potters Bar.

LEATHERHEAD.—September 26th.—For the supply of broken granite, team labour, disinfectants, brooms, and steam rolling and scarifying, for the urban district council.—Mr. S. R. Drake, surveyor, Leatherhead.

HOLLINGBOURN.—September 27th.—For the supply of steam rollers, for the rural district council.—Mr. H. J. Bracher, clerk, 33 Earl-street, Maidstone.

SUNDERLAND.—September 30th.—Quotations are invited by the rural district council for the purchase of a second-hand 15-ton road roller (Aveling & Porter), with Morris' patent detachable scarifier.—Mr. J. C. Wilson, clerk, 17 John-street, Sunderland.

SEAFORD.—September 30th.—For the supply of 500 tons of 1½-in. broken granite, for the urban district council.—Mr. W. H. Pawson, clerk, 3 Clinton-place, Seaford.

SANDGATE.—October 2nd. For the supply of 600 tons of Guernsey, Leicester, or Cornish granite, or Cherbourg quartzite, evenly broken to a 1½-in. gauge, and 600 tons of Guernsey, Leicester or Cornish granite, or Cherbourg quartzite chippings, evenly graded to ½-in. gauge, and free from dust, for the urban district council.—Mr. D. V. Howard, surveyor, Council Offices.

HOVE.—October 4th.—For the supply of broken stone, for the corporation.—Borough Surveyor, Town Hall.

BEACONSFIELD.—October 25th.—For the supply of 1,000 tons of 2½-in. and 1½-in. broken granite, for the urban district council.—Mr. H. T. Smith, surveyor, Council Hall, Beaconsfield.

Sanitary.

DUNDEE.—September 25th.—For the supply of disinfectants and soap, for the corporation.—Dr. C. Templeman, medical officer of health, West Bell-street, Dundee.

SOUTHWICK.—September 25th.—For the collection of house refuse, for the urban district council.—Mr. E. Webley, Town Hall.

CHERITON.—September 25th.—For the collection and removal of house and other refuse, for the urban district council.—Mr. A. Atkinson, jun., acting clerk, Public Offices, Cheriton.

HOLLINGBOURN.—September 27th.—For certain works at the sewage works, for the rural district council.—Mr. H. J. Bracher, clerk, 33 Earl-street, Maidstone.

SKIPTON.—September 30th.—For the construction of 760 lineal yards of 9-in. sewer and manholes, for the rural district council.—Mr. A. Rodwell, 16 Gargrave-road, Skipton.

BLEAN.—October 9th.—For emptying cesspools and removing house refuse, for the rural district council.—Mr. R. Miles, Eddington, near Herne Bay.

Stores.

HENDON.—September 28th.—For the supply of broken granite, tar-paving material, tarviated granite, granite chippings and gravel, brooms, shovels, forks, and carting materials, for the rural district council.—Mr. J. A. Webb, Great Stanmore, Middlesex.

Miscellaneous.

TILBURY.—October 2nd.—The urban district council invite tenders from recognised refuse destructor makers for the construction of a destructor and auxiliary plant.—Mr. S. A. Hill-Willis, engineer and surveyor, Council Offices, Dock-road, Tilbury.

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

SEPTEMBER.

23.—Institution of Municipal and County Engineers: East Midland District Meeting at Melton Mowbray.

28.—Institution of Municipal Engineers: Meeting of Western and South Wales Districts at Gloucester.

30.—Institution of Municipal and County Engineers: Eastern Sub-District Meeting (Suffolk, Norfolk, and Cambridge) at Stowmarket

30.—Institution of Municipal and County Engineers: North-Eastern District Meeting at Wath-on-Dearne.

OCTOBER.

6.—Municipal Waterworks Association: Annual Meeting, Metropolitan Water Board Offices, Savoy-court, London, W.C. 2 p.m.

7.—Institution of Municipal and County Engineers: Meeting at Watford.

APPOINTMENTS OPEN.

BARTON-ON-HUMBER URBAN DISTRICT COUNCIL.

SURVEYOR AND INSPECTOR OF NUISANCES.

The above Council are prepared to receive applications for the post of Temporary Surveyor and Inspector of Nuisances. Population about 6,000.

The person appointed must be fully qualified, and be ineligible for the Army.

The appointment will be made for the duration of the war only, or until the return of the Council's permanent Surveyor, and will be subject to the sanction of the Local Government Board.

Applications, in own handwriting, stating fully age, qualifications, salary required, and when can commence duties, with copies of not more than three recent testimonials, to be sent to the undersigned so as to reach him not later than the 30th September, 1916.

Canvassing will be a disqualification.

G. H. NOWELL,
Clerk to the Council.

Barton-on-Humber,
Lincolnshire.
September 12, 1916. (3,093)

CHESTERFIELD RURAL DISTRICT COUNCIL.

TEMPORARY APPOINTMENT OF INSPECTOR OF NUISANCES.

The above named Council invite applications from persons, ineligible for military service, for the appointment of Inspector of Nuisances for the Eckington District, which comprises the Parishes of Beighton, Coal Aston, Eckington and Killamarsh. Area 13,459 acres. Population (1911 census), 22,117.

Salary £130, rising by £5 per annum to £140 a year.

The appointment will be subject to the approval of the Local Government Board, and will be made for the duration of the war only.

The person appointed must hold the Certificate of the Royal Sanitary Institute, and will be required to fulfil all the prescribed duties of Inspector of Nuisances under the Public Health Acts and Regulations made thereunder; to assist in the work of the Council under the Housing, Town Planning, &c., Act, 1909, and at all times to carry out the lawful orders and directions of the Council. The appointment will be made on the understanding that the officer will reside at Eckington, and will devote the whole of his time to the duties of his office.

Applications, stating age, experience and qualifications, must reach me by Friday, the 6th day of October, 1916.

(By order of the Council)
R. F. HARTWRIGHT,
Clerk.

Union Offices,
Chesterfield.
September 18, 1916. (3,103)

BOROUGH OF BEDFORD.

TEMPORARY ENGINEERING ASSISTANT.

Wanted, in the Borough Engineer and Surveyor's Office, a Temporary Engineering Assistant (ineligible for military service) for the duration of the war.

Applications, in candidate's own handwriting, stating age and salary required, and giving full particulars as to experience, and accompanied by copies of not more than three recent testimonials, to be sent to the undersigned not later than Saturday, September 30th.

Canvassing will disqualify.

N. GREENSHIELDS, Assoc.M.Inst.C.E.,
Borough Engineer and Surveyor.

Borough Engineer and Surveyor's Office,
Town Hall, Bedford.
September 12, 1916. (3,097)

BOROUGH OF BEDFORD.

WATER INSPECTOR.

Wanted, in the Waterworks Engineer's Department, an Assistant Water Inspector (ineligible for military service).

Candidates must be qualified plumbers, capable of laying and repairing water mains, services, fittings, &c., and experienced in the management of men.

Wages 40s. per week, in addition to which a temporary war bonus of 5s. 6d. per week will be paid during the period of the war.

Applications, in candidate's own handwriting, stating age and giving full particulars of experience, and accompanied by copies of not more than three recent testimonials, to be sent to the undersigned not later than Saturday, September 30th.

Canvassing will disqualify.

N. GREENSHIELDS, Assoc.M.Inst.C.E.,
Waterworks Engineer.

Waterworks Engineer's Office,
Town Hall, Bedford.
September 12, 1916. (3,096)

SOMERSET COUNTY COUNCIL.

Wanted, Temporary Divisional Surveyor, to reside in Long Ashton. Ineligible for the Army. Applicants must be fully qualified, experienced in road making, manufacture of tar-macadam, and control of plant for same, surface tarring, &c. Able to control and supervise roadmen and keep detailed accounts, prepare estimates, &c. Salary to commence £115 per annum, with £30 per annum for upkeep of a motor cycle. Applications, stating age, experience, and accompanied by testimonials, to be sent to the undersigned.

GORDON R. FOLLAND,
Acting County Surveyor.

Wells, Somerset. (3,101)

The Surveyor

And Municipal and County Engineer.

Vol. L. SEPTEMBER 29, 1916. No. 1,289.

Minutes of Proceedings.

The Silence of the Engineer.

For some time past—and a long time before the war conditions became an excuse—we have drawn attention to the fact that there is a lamentable secretiveness in this country with regard to the work of the engineer. A mass of information has been gathered, great lessons have been learned and great things done, and the records are hidden by secretive persons and authorities who are mean enough to ask why others should benefit by their work. The result is public ignorance. It is true that the greatest men give the records of their life's work to the world often without any reward. But such is not the general rule; either we as a nation do not possess the gift of conveying our ideas to each other in written words or we have set up an utterly false idea of the merit of silence. One has only to read the pages of any technical civil engineering journal at the present time to find that, while it is full of well written and very interesting records of American practice, work often of far greater merit and of special interest in this country is not mentioned. One of the most striking instances of the lack of information is in the case of deep borings. As far as can be gathered, most of those who sink borings in great numbers gather their information and keep it to themselves. If one regards these persons merely as tradesmen such reticence is permissible; if, however, they wish to rank as engineers such reticence is not justified. The real reason is not far to seek. There are too many failures in this much-advertised method of obtaining water for any one interested to dare to publish a full record. In this case silence is golden to certain persons, and will remain so till the public are educated up to the point of knowing that a deep boring is always a risky undertaking. The engineers have it in their hands to educate the public, and this cannot be done by a policy of silence. In the first place it is absolutely essential that the newest and latest works and methods should be freely described and discussed. We also need free and open criticism of bad work and policy. It is useless waiting for the Government or Government departments to take the lead. Government departments are advised by men of moderate attainments, who, having fallen out of the ranks of the ordinary professional workers, are apt to be behind the times. Further, the chief object of such a department is to be on the safe side, and above all things to avoid laying itself open to criticism. They will not originate anything that is not their work. They can apply the brake, but others must apply the motive power.

There is not the slightest doubt that a great deal of work in this country, and particularly the work of local authorities, is very badly done by incompetent persons. Men are placed in engineers' positions who are so ill-paid and so badly treated that it is impossible for them to carry out work properly. Further, no properly qualified engineer will work for the salary offered or submit to the treatment. It is equally in the interest of the profession and of the public to deal with such cases, and by criticising the methods adopted, proving the waste of money, and by forcibly objecting to engineers' work being handled by incompetent persons and interfered with by ignorant councillors. Also we should try to render the attitude of such local authorities impossible. It is the silence of the engineer and the consequent deep ignorance of the public which makes bad work possible, and which consequently lowers the position of the district surveyor and the engineering profession as a whole. The public have been educated to the point of knowing that a medical officer must be a properly qualified man. Why should they not be similarly educated in the knowledge that an engineer's work is quite as important, and that he must be properly qualified, properly paid, and properly treated? The people of England are not fools, and if they can once be educated to the extent of understanding the folly of allowing their money to be wasted by incompetent persons they will not be slow to put an end to the system. Further, these are times when the public show a keen interest in all engineering matters, and full descriptions of the newest and best methods will be readily comprehended. It is therefore the duty of the engineer to see that the records and results of his work are brought forward prominently, that the errors of the past are made clear, that popular belief in old and discredited systems is removed, and that the true value of the qualified engineer is understood. Moreover, the idea that an engineer is qualified for special work solely by some general examination must not be encouraged, for this will

merely lead to an educated person of incompetence being placed in a position in which he will bring discredit on to the profession.

It cannot be too well understood that an engineer is qualified by his education, training, and experience for the special work which he undertakes to do. These and nothing else are his qualifications, and they can always be ascertained. If you want a man to make aeroplanes, see that he has been trained for that work and that he has actually made aeroplanes. If you want a man to act as a municipal engineer, see that he has also been trained for that work, and that he has actually fulfilled the duties satisfactorily. No other qualification can exist. Let the public learn these facts, and let engineers give support to the efforts now being made to enable them to do so; it will give an increased vitality to the profession, it will give fresh energy to professional meetings, it will give the engineer his proper position, and it will remove the dense public ignorance which is the cause of trouble. All this and more can be done, but it will not be done by silence.

Tramway Problems.

The fifteenth annual conference of the Municipal Tramways Association, which was held in London at the end of last week, afforded an opportunity to Mr. J. M. McElroy, the general manager of the Manchester Corporation Tramways, to read a paper in which he discussed some of the more important problems of modern tramway traffic in large cities. These problems arise principally in two directions. First, the constant tendency of the population to move from the centre to outer zones has a very direct relationship to cheap passenger transport facilities. Indeed, it may be said that town planning schemes and the making of provision for future passenger transport requirements are really part and parcel of the same problem, and should be considered together. The second group of problems arises from the fact that every extension of the means of transit into the outer zones adds to the difficulties of handling the traffic at the centre. This central congestion can only be met by the provision of overhead or underground railways—which do not come within the sphere of the tramway manager or engineer—or by shallow subways into which surface cars can be run. The last mentioned are generally impracticable owing to the enormous capital expenditure involved. It has been said, indeed, that underground lines of any description can only be justified by a dense traffic demanding the operation of high-speed trains run at very close intervals.

In studying the problem in Manchester—where several of the arterial routes approaching the centre of the city have practically reached the saturation point—Mr. McElroy came to the conclusion, after careful consideration, that the proper course for the corporation to pursue to meet the constantly growing requirements was—before attempting to provide underground facilities, the cost of which is so enormous—to improve and make more efficient the existing surface lines by opening out parallel routes, by forming new streets and widening others at considerable cost, and also by adopting tramway terminals near the heart of the city, the latter being necessary on account of the narrowness and bad lay-out of the central streets. Mr. McElroy also had some very pertinent remarks to make as to the relative merits of tramcars and motor 'buses. In the past this important question has too frequently been discussed from an abstract point of view and without reference to the particular purpose for which the vehicles are intended to be used. The truth is that each type of vehicle has its peculiar advantages, and in the future each will be utilised for handling that class of traffic for which it is best suited. The tramcar, on account of its greater seating capacity and its ability to cope with traffic of a widely fluctuating character, will be utilised where heavy peak loads have to be catered for. On the other hand, where the volume of traffic is not great, or where there is a steady traffic flow throughout the day, motor 'buses will probably prove to be the more suitable vehicles. In some instances it may be found to be advantageous to run the two types of vehicle along the same routes, not in indiscriminate competition and without direct reference to the requirements of the public as is the case in London to-day, but by a scientific adjustment throughout the day of the type of vehicle to the demand.

Cardigan Rural Surveyor's Salary.

The surveyor to the Cardigan Rural District Council, being we trust a grateful man, will doubtless all the more manifest this quality as the outcome of a discussion at a recent meeting of the council. When it is stated that, as a result of these proceedings, the surveyor had his salary increased from 21s. to 25s. per week (including 1s. war bonus) little more need be said to prove the progressive and generous spirit actuating the public actions of Cardigan's rural councillors. The figures quoted stand for a definite and tangible advance, and who shall say that this does not imply progress? They also postulate something like a pathetic concern (of which the 1s. war bonus may be accepted as an incidental example) of the council for the worldly welfare of their officer, and who shall deny that is not distinctly suggestive of generosity? Little need have been added to the bald record of fact, but for the views to which one or two speakers gave expression in the course of the discussion. It should be explained that the proposer of the increase laid down the condition that it was to be granted if the surveyor devoted six instead of five days a week to the service of the council, otherwise it was to be conceded upon the grounds that he was entitled to it, that the increased cost of living affected him as much as anyone else, and also that he had done his utmost to reduce the cost of the maintenance and repair of the highways. As against these reasons for the proposition it was urged that to increase the surveyor's salary would be a "wastage," especially as "any man could do the work of a highway surveyor;" and that an increase of 4s. per week was excessive—was, so to speak, a piece of downright extravagance and prodigality. As showing how perilously near to losing his increase the surveyor was, it may be stated that it was only carried by a majority of one, a fact which will doubtless make him chary of testing the feeling of the council for a long while to come. Seriously, however, is it not a scandal that public officials performing duties of recognised responsibility and importance should be subject to such conditions of service as this? While it may be pitiful that such a salary as 21s. per week should be accepted for the discharge of professional work, it is almost despairing to find that there are still existing public bodies which offer such a paltry pittance to any official, but more particularly to a surveyor. A remedy must be found for such an intolerable state of things.

Progress at Melton Mowbray.

The paper read by Mr. Edmund Jeeves, the surveyor to the Melton Mowbray Urban District Council, at the East Midland District meeting of the Institution of Municipal and County Engineers held in that town on Saturday last, shows that the district is one in which the local authority has always been alive to the importance of progress in sanitary administration.

Melton Mowbray is an ancient market town, and in the earlier half of the nineteenth century it was, from the sanitary point of view, apparently no better than other similar towns. For example, prior to the year 1860 there were no sewers, the whole of the drainage being conveyed to the river in open watercourses. In that year the first drainage scheme was carried out, and this was followed in 1875 by a scheme designed by Mr. Baldwin Latham, and in 1896 and 1907 by schemes for the improvement of the outfall works. Again, with regard to refuse disposal, this was for many years effected by the simple process of tipping into an old brick-yard at one end of the town, but upon the nuisance from this primitive method becoming more apparent, arrangements were made for the erection of a destructor, which started to work in February, 1915. Similar progress has been made with regard to water supply. Prior to 1886 the supply was derived from local wells, which gradually became unfit for use owing to pollution; accordingly in that year a gravitation scheme was carried out. An underground spring was tapped about 3 miles from the town, an adit was constructed to hold 100,000 gallons, which was then a day's supply, and cast-iron mains were laid. Again, it appears that in the old days the cattle markets were held in the streets, but this became such a nuisance that in 1869 a special Act of Parliament was obtained authorising the construction of proper market buildings and the levying of tolls. Altogether, Mr. Jeeves' paper contained a record of excellent progress, upon which the council and its expert advisers are to be congratulated.

Housing after the War.

In our last issue we referred to the deputation which recently waited upon Mr. Walter Long, the President of the Local Government Board, in order to bring to the notice of the Government a series of resolutions regarding the problem of housing after the war, which were adopted some time ago by a conference on the subject under the auspices of the National Housing and Town Planning Council. The reply of the President was eminently satisfactory, in that it contained an official recognition of the fact that a solution of the housing question lies at the root of all social reforms, and a definite promise to lay before his colleagues in the Government the case for a grant-in-aid on an adequate scale. When the war is over there is certain to be the keenest competition between the advocates of various kinds of social reform, and there is some danger that the vital importance of housing may be lost sight of unless those who are alive to the real circumstances take every step to keep it in the foreground. Curiously enough, the war has at once caused a practical cessation of cottage building, and created a new and powerful reason for improved housing accommodation. As Mr. Long said, it would indeed be a crime if, upon returning from the sufferings and discomforts of trench warfare, our heroes are compelled, owing to lack of foresight on the part of those who have remained at home, to come back to homes that are in many cases barely fit for human habitation at all. We sincerely hope that the good words of Mr. Long may be speedily translated into action by the Government.

Plane Trees: A Superstition.

The old superstition that the presence of plane trees in the vicinity of dwelling-houses is conducive to cancer was recently revived by a resident of Claygate, Surrey, who wrote to the Esher and the Dittons Council complaining that a plane tree on the highway near her house not only obstructed the access of light and air, but also might lead to the onset of the disease named. Local investigation certainly revealed a curious coincidence, in that it was discovered that three people living in the road in question had died from cancer, and there was a plane tree outside each house. But the medical officer of health pointed out that this could be no more than a coincidence, because plane trees are probably the most commonly used variety for planting in streets, and if the alleged danger were a real one, some districts that are quite immune would be devastated by cancer. The plane tree, which flourishes so well in urban surroundings, has, if our memory serves us, also been attacked because it is alleged that it sheds spicules which are conducive to nasal irritation and thus cause a kind of hay fever. Nevertheless it retains its popularity. At all events the Esher and the Dittons Council do not believe in the cancer superstition, because, although the offending tree is to be pruned so that it does not obstruct light and air, it is not to be removed, in spite of the lady resident's nervousness.

* * *

Water Waste.

For some time past we have been emphasising the need for securing a drastic reduction in the general waste of water which takes place throughout the country. The one disadvantage of charging for water by a rate and not according to the amount consumed lies in the temptation to careless and reckless waste which inevitably follows upon the knowledge that extravagance does not affect the amount of the quarterly bill. We are now glad to find that our efforts have not been wholly in vain. At a recent meeting of the Ossett Water Committee the engineer, in dealing with the question of waste, quoted from our columns in his report. From a report of the meeting we observe that he read an extract from The Surveyor emphasising the national importance of economy in the use of water at a time when every penny saved means so much to the country. At the following council meeting the chairman of the committee asked the ratepayers to exercise economy in consumption, and to notify any wastage, particularly owing to defective fittings. The public do not appear to realise that every gallon of water used has to be paid for, and other local authorities would do well to follow the example of the Ossett Town Council in officially calling attention to the matter.

Women's Work in War Time.

The fact that an application for membership by a woman has been received by the Institute of Metals naturally leads one to reflect on the possibility of similar applications being made to other engineering societies. Hitherto the engineering profession has not, so far as we are aware, attracted women aspirants, but in these days it is well within the bounds of possibility that this may be changed. We do not remember that there is anything in the constitutions of the leading institutions which would preclude them from admitting women to membership if they were disposed to do so. The Institution of Municipal and County Engineers has as yet no women members, but in Mrs. Robinson, who has been appointed acting secretary during her husband's absence on active service with the H.A.C., they have the distinction of being the first engineering institution to have a woman acting in this capacity. Like her husband, Mrs. Robinson has considerable scientific attainments, and holds the degree of Bachelor of Science in the University of London. The members generally will join in wishing her success in the work she has so pluckily undertaken, and a speedy and safe return to duty of Mr. Robinson.

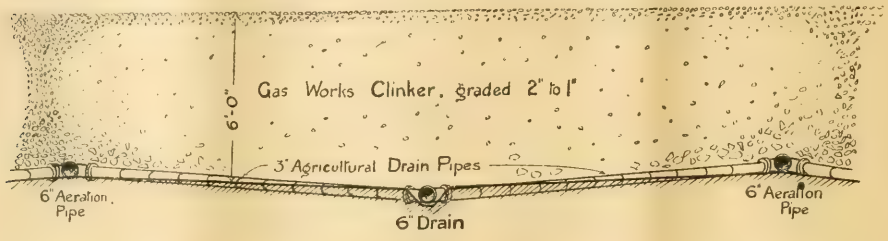
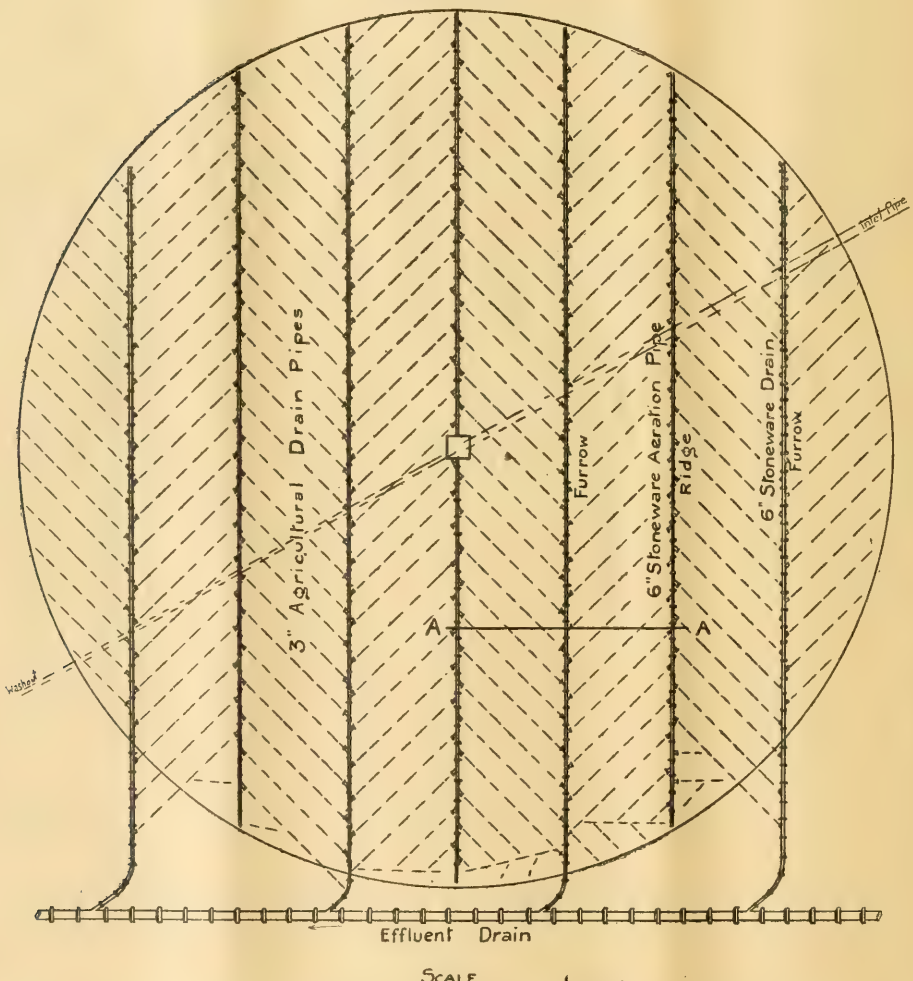
Economical Sewage Filter-Bed Construction.

The percolating filter-bed is now a very usual feature in a sewage disposal scheme, and where adopted is sure to be responsible for a notable proportion of the cost of the scheme. It is not at all a costly item per unit of area, but as it is only by the use of ample filter area that a satisfactory effluent can be obtained, the aggregate cost is considerable.

Any method, therefore, of reducing the cost of the construction of such beds is worthy of close consideration, for a small saving on each square yard will mean an appreciable reduction of the total cost.



Cross Section A A.



Plan of Drains.

PERCOLATING FILTER, LUTON.

Yet it would be very false economy to reduce the cost of the filter if in so doing the efficiency of the bed is impaired or its effective life shortened. If the effluent obtained is not satisfactory it is no consolation that the beds were cheap; while to have to rewash the filtering medium at the end of every five, or even ten, years is to be saddled with a heavy maintenance cost, as well as to be in constant risk from an effluent of varying quality. Cheapness is not economy if it reduces efficiency or shortens life.

The chief item of cost, of course, is the filtering medium, and here local conditions are the predominating factor. What is cheap at one place is expensive at another, and each locality must make its own selection by the light of local knowledge, assisted by reliable information as to the relative merits of the types of material available for the purpose in view.

The next item in the scale of cost is what may be called the constructional works—viz., the concrete floor, the false-tile floor, and the walling. In some instances these works are pushed to considerable elaboration, and represent a heavy proportion of the total cost of the filter-bed. It is here, if anywhere, that a saving is to be effected, and the only sure guide of what may or may not be reduced or omitted is experience.

In this connection a recent report by the borough engineer of Luton upon the filter-beds installed there some years ago is of interest. These filter-beds were constructed, most of them, in 1910-11, as part of the scheme then carried out for dealing with the whole of the sewage of the borough, the remainder having been added since 1914 to meet the requirements of a rapidly growing population. The beds are all similar in construction. They are circular, 100 ft. in diameter, with a depth of filtering material of 6 ft., except in three cases, where the depth is only 4 ft. There is no concrete floor to the beds, the filtering medium being placed immediately upon the consolidated earth. The subsoil is chalk, and this was thoroughly rolled with a steam roller before the construction was commenced. The area of the bed was then shaped into a series of parallel ridges and furrows, the ridges being 25 ft. apart, and having an elevation of 6 in. above the furrows, both furrows and ridges having an inclination of 1 in 200 towards the effluent drain, which passes the bed at right-angles to them. A shallow grip is then cut up each furrow, and a 6-in. stoneware drain is laid along it, bedded in large clinker. Every pipe of this drain is a junction pipe, and the junctions are alternately right and left hand. From each junction a 3-in. agricultural drain pipe, also laid in a grip and packed in clinker, runs up the slope in a straight line from the junction to a 6-in. stoneware drain on the ridge, which is similar in all respects to the one in the furrow, except that its junctions point in a reverse direction and that it is not sunk in a grip. None of the pipes are jointed. The floor of the bed is thus provided with a system of subsoil drains. The drains from the furrows discharge into the main effluent drain, and those from the ridges are turned up at each end and open through the wall of the filter-bed to the air.

Upon the floor thus prepared the filtering material—in this case it consisted of London gasworks clinker—is laid, grading and placing in position being done simultaneously. The wall of the bed is formed simply of large pieces of the material laid as rough walling.

From these particulars it will be seen that a cheaper form of construction than that adopted could not well be devised. The report referred to above appears to answer the question whether this construction is justified by results. It states:—

"No. 1 filter-bed was opened and examined in the summer of 1913 after a life of three years, and a report upon its condition was then presented. This year (1916), after being continuously at work for six years, the bed has again been opened up and carefully inspected. The drains were found to be perfectly clear and free from any trace of solid deposit. The filtering material in the top half of the bed was quite clear and contained no deposit at all. Below this there was a small quantity of deposit to be found on almost every piece of clinker, but there was no indication of the deposit being anywhere in such quantity as to approach a condition of local silting up. Compared with the condition found on examination three years ago, there can be no question that at present the bed is cleaner than it was then. This would indicate that the deposit present is one which is continuously being washed away and continually added to in the working of the filter, and is the normal and natural state of the bed, and in no way indicative of deterioration. It is worthy of note that the particular bed examined has been in continuous use during the past twelve months, without even the briefest period of rest, but has worked night and day, seven days a week, at full capacity. . . .

"As you are aware, the quality of the effluent obtained has always been of the highest, and has satisfied the Lee Conservancy.

"The conclusion arrived at is that the bed is quite self-cleansing, and will continue to give efficient service for an indefinite period."

By the courtesy of Mr. J. W. Tomlinson, the borough engineer of Luton, we are able to reproduce a drawing indicating the construction of these filter-beds. We understand there are twenty of them in use at Luton, and it will be evident that the saving secured by omitting the usual brick walling, false and concrete floors must have been very considerable, and, apparently, so far as results go up to date (and six years is a fair period for discovering defects), the filters are as satisfactory as any filters, however constructed, could be.

THE MAGIC OF SEWAGE DISPOSAL.

HOW THE BACTERIOLOGICAL TREATMENT WAS DISCOVERED.
